|  |  |  |  |  | 152/230 (66,1 %) patients traités avec le fil-guide inclus dans le kit FemoSeal™ (0,038 po) et recommandé pour le FemoSeal™ sans déficiences de l'appareil ou événements indésirables signalés. |
|--|--|--|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

L'étude de 2006 a été menée pour confirmer la sécurité et l'efficacité du dispositif actuel avec un système d'administration amélioré et pour obtenir des commentaires sur le mode d'emploi et le programme de formation du FemoSeal™ VCS. L'étude incluait 100 patients et le critère d'évaluation principal était de savoir si l'hémostase était atteinte ou si des compressions manuelles ou mécaniques supplémentaires étaient nécessaires. Cette étude a conclu que l'application du FemoSeal™ VCS a réussi dans la majorité des cas (91 % ont obtenu une hémostase immédiate).

L'étude de 2008 a recruté 50 patients pour évaluer la sécurité et les performances du FemoSeal™ VCS lorsqu'il est utilisé pendant une routine clinique normale chez des patients subissant un cathétérisme cardiaque avec un introducteur 7 Fr. Le critère d'évaluation principal de l'étude était de recueillir des données sur le délai avant l'hémostase et le délai avant la déambulation sans compression supplémentaire (manuelle ou mécanique). Les résultats de l'étude ont conclu que le délai moyen avant l'hémostase était de 57,8 secondes et que tous les patients ont déambulé après 4 heures de repos au lit.

L'étude de 2009 visait à évaluer le nouvel emballage du FemoSeal™ VCS. Vingt-cinq patients ont été inclus dans l'étude. Le critère d'évaluation principal était de savoir si l'utilisateur rencontrait des problèmes avec l'emballage. Les utilisateurs n'ont noté aucun problème concernant le nouvel emballage du FemoSeal™ VCS. Cette étude a également recueilli des données sur le temps écoulé avant l'hémostase.

L'objectif de cette étude de 2022 était de démontrer de manière proactive l'innocuité et l'efficacité du FemoSeal VCS dans l'obtention de l'hémostase du site d'accès à l'artère fémorale commune (AFC) chez des sujets du monde réel subissant des procédures endovasculaires percutanées. 230 patients ont été inclus dans l'étude. Les principaux critères d'évaluation de l'étude sont la réussite de la procédure (c'est-à-dire l'hémostase réussie du site de ponction) et la diminution des complications majeures (par exemple, lésion vasculaire, saignement lié au site d'accès, infection du site d'accès, compression manuelle répétée et nouvelle ischémie ipsilatérale aiguë de la jambe liée au site d'accès). L'étude a conclu que le FemoSeal™ VCS fonctionne bien dans des environnements concrets, permet une hémostase efficace et de faibles taux de complications au niveau du site d'accès pour les patients subissant des interventions endovasculaires périphériques. Il se révèle performant, avec un délai pour atteindre l'hémostase

court et un bon retour d'information de l'opérateur, ce qui en fait un appareil précieux pour la fermeture de l'accès fémoral.

### 1.4.3 Résumé des données issues du suivi clinique post-commercialisation

#### 1.4.3.1 Suivi clinique post-commercialisation terminé

Un résumé des activités de suivi clinique post-commercialisation réalisées est décrit dans le **Tableau 1.7** ci-dessous.

**Tableau 1.7. Activités de suivi clinique post-commercialisation**

| Activités de suivi clinique post-commercialisation terminées              |             |                                                                    |                                                                                                                                                                                                           |                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Terumo Medical Corporation a réalisé trois enquêtes de haute qualité auprès des utilisateurs médicaux au cours de la période sous revue en cours (du 1<sup>er</sup> septembre 2019 au 31 août 2024).

Les enquêtes cliniques sur le FemoSeal™ ont recueilli des données cliniques proactives concernant la sécurité et les performances du FemoSeal™ VCS pendant l'utilisation clinique. L'enquête comprenait des questions portant sur le dispositif dans son ensemble et ses accessoires, notamment le fil-guide de 0,038" et ses interactions directes. Les études cliniques sur le fil-guide ont recueilli des données cliniques proactives relatives à la sécurité et aux performances pendant l'utilisation clinique du fil-guide de 0,038" fourni avec le FemoSeal™ VCS. Les questions de l'enquête portaient spécifiquement sur l'utilisation générale du fil-guide, allant de l'insertion dans le système vasculaire à l'insertion dans l'introducteur, en passant par le retrait du fil-guide.

Le FemoSeal™ VCS et le fil-guide de 0,038" inclus avec le dispositif ont reçu toutes les notes admissibles et six (6) plaintes ont été déposées pour le dispositif et neuf (9) non-plaintes pour le fil-guide sur la base de l'évaluation des observations reçues lors des études cliniques de haute qualité. Les plaintes ont été évaluées pour le dispositif FemoSeal et le fil-guide et ont été évaluées dans le cadre du processus de surveillance post-commercialisation de Terumo. Aucun nouveau risque ni niveau de risque n'a été identifié.

Une enquête auprès des utilisateurs de médecins a été réalisée en 2024 dans le cadre des activités de PMCF. Les résultats de l'enquête ont démontré que l'évaluation des performances et de la

sécurité du FemoSeal™ VCS étaient globalement très favorables. La compatibilité d'autres fils-guides que le guide standard fourni avec le FemoSeal™ VCS a également été démontrée.

#### **1.4.3.2 Suivi clinique post-commercialisation en cours/planifié**

TMC a deux activités de suivi clinique post-commercialisation en cours/planifiées. Une étude clinique sera réalisée pour recueillir de manière prospective des observations concernant l'utilisation du fil-guide avec le FemoSeal VCS distribué sur le marché de l'UE. L'enquête sera complétée par des médecins dans le but d'étudier les fils-guides qu'ils ont utilisés pendant la procédure. L'objectif de cette enquête est de combler une lacune identifiée comme étant le manque de documentation et de commentaires d'examineurs externes sur la compatibilité du FemoSeal™ VCS avec l'utilisation d'autres fils-guides de marques autres que Terumo. Le retour d'informations comprend les résultats techniques, les performances cliniques et la sécurité liés aux performances du dispositif avec différents fils-guides.

#### **1.4.4 Résumé des données issues de l'examen systématique de la littérature**

Terumo Medical Corporation procède à des revues systématiques de la littérature afin de recueillir et d'évaluer les données de sécurité et de performances cliniques issues des études publiées sur le FemoSeal™ VCS et/ou des dispositifs similaires. L'objectif de cette étude annuelle de la littérature est d'identifier les effets indésirables non connus, de surveiller les effets indésirables connus, de détecter les risques émergents et d'identifier une mauvaise utilisation systématique ou une utilisation non prévue du FemoSeal™ VCS.

La revue systématique de la littérature la plus récente, qui couvre la période allant du 1<sup>er</sup> septembre 2019 au 31 août 2024, a permis d'identifier 29 études publiées qui ont fourni des données de sécurité et de performances cliniques sur le FemoSeal™ VCS. Vingt-trois références ont signalé une utilisation prévue du FemoSeal™ VCS et une utilisation non prévue a été signalée dans neuf études. Dans l'ensemble, la revue dans la littérature d'études spécifiques à l'utilisation du FemoSeal™ VCS montre une population en cours d'étude représentative des patients de l'UE subissant des procédures de cathétérisme vasculaire percutané. Voir la **Section 3** pour voir une liste de ces 23 publications examinées par des pairs.

Les performances cliniques ont été évaluées par les mesures suivantes :

- Le délai avant l'hémostase est meilleur ou comparable à celui de la technique de pointe pour la fermeture percutanée de l'artère fémorale.
- Le délai avant la déambulation est meilleur ou comparable à celui de la technique de pointe pour la fermeture percutanée de l'artère fémorale.
- Le taux de complications postopératoires est comparable ou inférieur aux normes de soins actuelles.

Sur la base de ces indicateurs de performance clinique, les données de cette revue de la littérature ont démontré que le FemoSeal™ VCS peut être utilisé avec succès pour fermer la ponction dans l'artère fémorale (artériotomie) chez des patients qui ont subi un cathétérisme percutané à l'aide d'un introducteur 7 Fr ou de plus petite taille. Une hémostase complète a été obtenue chez la majorité des patients (79,65 - 100 %) des cas et a été associée à un délai médian jusqu'à l'hémostase de 0,5 min et un délai moyen jusqu'à la sortie de l'hôpital de 3 jours. Entre 69,2 et 86,7 % des patients ont pu déambuler 5 heures après la fermeture, avec un repos au lit postopératoire moyen de 349 min. Une défaillance du FemoSeal™ VCS a été observée dans 3,68 à 4 % des cas et une compression manuelle supplémentaire a été nécessaire dans 0,9 à 4,4 % des procédures.

La sécurité clinique a été évaluée par le biais des événements indésirables, y compris, mais sans s'y limiter :

- Saignement
- Hématome
- Pseudo-anévrisme
- Ecchymoses
- Fistule artérioveineuse
- Infection
- Décès

Pour chacun de ces événements indésirables, le taux d'occurrence rapporté pour le FemoSeal™ VCS dans les études incluses était inférieur ou comparable aux taux rapportés historiquement pour la compression manuelle et les autres appareils de fermeture vasculaire.

Aucun événement indésirable n'a été identifié lors de l'examen de 10 rapports d'intervention, car aucun risque nouveau, non anticipé, émergent ou inacceptable n'a été identifié.

L'efficacité globale de l'utilisation du FemoSeal™ VCS pendant l'angiographie diagnostique ou les interventions chirurgicales dépend de plusieurs facteurs tels que le sexe, l'âge, l'anatomie du patient, les comorbidités, le positionnement anatomique du site de ponction, l'expérience du chirurgien, la méthode de déploiement du VCD, les soins postopératoires, etc. Outre le succès technique, y compris l'obtention de l'hémostase, le FemoSeal™ VCS a offert des bénéfices cliniques par rapport à la fermeture vasculaire après ponction artérielle fémorale, tels que la réduction du délai jusqu'à l'hémostase et la réduction du délai avant la déambulation. Le score des performances du FemoSeal™ VCS sont cohérents avec ceux attendus pour ce type d'appareil lorsqu'il est utilisé comme prévu. Certaines des références récupérées au cours de la période de recherche actuelle ont montré l'utilisation de l'appareil du sujet dans un endroit anatomique autre que l'artère fémorale commune et pour la fermeture d'artériotomies > 7 Fr, ce qui est considéré comme une utilisation non prévue.

Lors de l'examen, aucun effet secondaire inconnu, aucun risque émergent ni aucune mauvaise utilisation systématique possible de l'appareil n'ont été identifiés. Cependant, si le FemoSeal™ VCS est utilisé avec précaution par des médecins formés, le dispositif médical fonctionne comme un appareil clinique utile et nécessaire. Globalement, le traitement cible et donc le FemoSeal™ VCS répondent au besoin clinique qui existe actuellement dans le traitement des complications liées à l'accès vasculaire.

Dans l'ensemble, les données de cette revue de la littérature n'ont pas mis en évidence de problèmes de performances ou de sécurité précédemment inconnus dans le contexte clinique, ni d'effets défavorables survenus à des taux plus élevés que celui prévu/acceptable. Par conséquent, il ressort de cette revue de la littérature que le FemoSeal™ VCS, lorsqu'il est utilisé pour fournir une compression pour atteindre l'hémostase au niveau de l'artériotomie après un cathétérisme percutané, continue à fonctionner comme prévu et n'est pas associé à des événements graves de sécurité.

#### **1.4.5 Résumé des données issues de la surveillance post-commercialisation**

Un système PMS proactif est en place et un examen de toutes les réclamations est effectué tous les mois et conformément aux procédures de fabrication internes. Les données relatives aux réclamations ont été analysées entre le 1<sup>er</sup> septembre 2019 et le 31 août 2024. Dans l'ensemble, 28 rapports de matériovigilance (MDV) et 476 plaintes de clients ont été soumis au fabricant. Sur les 28 rapports MDV, 27 étaient liés à des événements indésirables et un à un dysfonctionnement de l'appareil. Il y a eu deux décès au cours de la période considérée, mais aucun des décès signalés n'a été jugé lié à l'appareil concerné. Parmi les 476 plaintes adressées au fabricant, les raisons les plus fréquentes des plaintes étaient des difficultés de déploiement (146 occurrences, taux d'occurrence de 0,0142 %). Le mode de défaillance des événements de retrait est le deuxième le plus fréquent avec un taux de 0,0126 % (130 événements).

Le système de fermeture vasculaire FemoSeal™ a été vendu à plus de 1 030 136 exemplaires dont 827 843 dans l'Espace économique européen. La fréquence des plaintes sur la base des ventes dans le monde est de 0,046 %. Le taux global de plaintes de clients est très faible. Aucun nouveau risque non inclus dans le mode d'emploi et la documentation sur les risques n'a été identifié.

Les taux d'occurrence des effets secondaires indésirables sont présentés dans le **Tableau 1.2**. Aucun nouveau risque inattendu, émergent ou inacceptable n'a été identifié. Il n'y a pas eu d'augmentation significative de la fréquence ou de la gravité des effets secondaires indésirables connus.

#### **1.4.6 Résumé global des performances cliniques et de sécurité**

Le FemoSeal™ VCS est indiqué pour la fermeture de la ponction artérielle dans l'artère fémorale commune (artériotomie) chez les patients ayant subi un cathétérisme percutané à l'aide

d'un introducteur de 7,33 mm (7F) ou moins. Cette évaluation clinique se base sur une analyse complète des données cliniques et de la littérature disponibles avant et après commercialisation, pertinentes pour l'utilisation prévue du FemoSeal™ VCS.

Une revue complète de la littérature publiée a été menée entre le 1<sup>er</sup> septembre 2019 et le 31 août 2024. Le faisceau des preuves comprenait 29 études pour le FemoSeal™ VCS. Les preuves fournies dans l'évaluation clinique concluent que, lorsqu'il est utilisé comme indiqué, le dispositif du sujet est sûr et efficace et que tous les risques ou effets secondaires indésirables, qui peuvent être associés à l'appareil dans des conditions normales d'utilisation, constituent des risques acceptables lorsqu'ils sont comparés aux avantages pour le patient. Le score des performances des appareils sujets sont cohérents avec ceux attendus pour ce type d'appareil lorsqu'il est utilisé comme prévu.

Les effets secondaires indésirables potentiels associés à l'utilisation du FemoSeal™ VCS incluent les événements indésirables fréquemment signalés avec d'autres moyens de fermeture d'artériotomie, par exemple, saignement et hématome. Dans l'ensemble, les taux d'occurrence des événements indésirables rapportés avec l'utilisation du FemoSeal™ VCS sont similaires aux taux rapportés avec la compression manuelle et les dispositifs de fermeture vasculaire similaires. Plus précisément, pour les saignements et les hématomes, les taux rapportés pour le FemoSeal™ VCS sont inférieurs aux taux rapportés pour les dispositifs de fermeture vasculaire similaires. Chacun des événements indésirables signalés, issus à la fois de la littérature publiée et de la surveillance post-commercialisation, avait été précédemment identifié (voir **Section 1.3**).

Les données existantes concernant la sécurité et les performances cliniques du FemoSeal VCS suggèrent que les bénéfices pour le patient de l'utilisation de ce dispositif de fermeture vasculaire l'emportent sur les risques potentiels lorsqu'il est utilisé conformément au mode d'emploi.

Comme indiqué dans les paragraphes précédents, les données fournies pour le FemoSeal™ VCS démontrent la concordance entre les données relatives au dispositif évalué (par exemple, l'utilisation du dispositif, les résultats en matière de sécurité, les performances et les bénéfices cliniques), les dispositifs équivalents identifiés et les données liées à des dispositifs similaires répertoriés dans les données les plus récentes.

L'analyse croisée des données de sécurité n'a pas permis d'identifier de différences entre :

- Les données mentionnées dans les informations les plus récentes
- Les données spécifiques au dispositif analysé
- Les données mentionnées dans le(s) dossier(s) de gestion des risques
- Les données mentionnées sur l'étiquetage et/ou le mode d'emploi (les risques résiduels à transmettre à l'utilisateur sont traités)

La sécurité clinique a été démontrée par de faibles taux de complications identifiées dans la littérature clinique examinée par des pairs, des études cliniques parrainées par des sociétés, l'examen des données post-commercialisation associées à l'absence de retrait du marché. Aucun problème de performances n'a été relevé. La littérature examinée indiquait une utilisation du dispositif FemoSeal™ VCS conforme à l'utilisation prévue par le fabricant.

### **1.5 Autres diagnostics ou traitements possibles**

La compression manuelle est traditionnellement utilisée pour obtenir une hémostase au niveau du site d'artériotomie après un cathétérisme vasculaire. La compression manuelle a été associée à l'immobilisation du patient pendant de longues périodes (jusqu'à 8 heures après une procédure), à une gêne importante et à des séjours prolongés à l'hôpital. Une étude systématique récente a révélé que le délai moyen pour atteindre l'hémostase avec compression manuelle était de 20,8 minutes. <sup>1</sup>

Les dispositifs hémostatiques externes qui appliquent une compression mécanique au niveau du site d'artériotomie sont des solutions de remplacement à la compression manuelle. Ces dispositifs ne raccourcissent pas le délai avant l'hémostase ou la déambulation, mais réduisent les besoins en personnel en remplaçant la compression manuelle par la compression mécanique. Les taux d'événements indésirables associés à l'utilisation de la compression mécanique sont similaires à ceux de la compression manuelle.

Les appareils de fermeture vasculaire, comme le FemoSeal™ VCS, sont conçus pour fermer l'artériotomie. Ils visent à réduire le temps d'hémostase et à permettre une déambulation plus précoce. Une étude systématique récente incluant 13 dispositifs disponibles sur le marché a révélé que le délai moyen pour atteindre l'hémostase avec un dispositif de fermeture vasculaire était de 5,4 minutes. Le délai moyen pour atteindre l'hémostase pour les différents dispositifs de fermeture vasculaire allait de 1 minute (FemoSeal™ VCS) à 14 minutes ; le délai pour la majorité des appareils étant compris entre 4 et 10 minutes. <sup>1</sup>

Les événements indésirables fréquemment rapportés liés à la fermeture du site d'artériotomie, avec des compressions manuelles, des appareils hémostatiques externes ou des dispositifs de fermeture vasculaire, comprennent un hématome, un saignement au niveau du site d'accès, un pseudo-anévrisme, une fistule artérioveineuse et une infection. La même étude systématique (34 études contrôlées randomisées, 14 401 patients) a révélé que les taux d'événements indésirables étaient similaires entre la compression manuelle et l'utilisation de dispositifs de fermeture vasculaire. Toutefois, l'étude a révélé que les saignements avaient tendance à être un peu plus élevés avec les dispositifs de fermeture vasculaire. <sup>1</sup>

## 1.6 Suggestions de profils d'utilisateurs et de formations

Les utilisateurs auxquels le FemoSeal™ Vascular Closure System est destiné sont des médecins qui ont suivi une formation leur permettant d'effectuer un accès et une fermeture artériels pour des procédures endovasculaires par le biais de l'artère fémorale commune et qui ont participé à un programme de formation pour médecins FemoSeal™ de Terumo Medical Corporation.

Αυτή η περίληψη των χαρακτηριστικών ασφάλειας και των κλινικών επιδόσεων (SSCP) προορίζεται για την παροχή πρόσβασης στο κοινό σε μια επικαιροποιημένη περίληψη των κύριων πτυχών της ασφάλειας και των κλινικών επιδόσεων του FemoSeal™ Vascular Closure System (VCS).

Μια περίληψη των χαρακτηριστικών ασφάλειας και κλινικών επιδόσεων του ιατροτεχνολογικού προϊόντος για χρήστες/επαγγελματίες υγειονομικής περίθαλψης παρέχεται παρακάτω στην **Ενότητα 1.0**.

## **1.0 ΣΥΝΟΨΗ ΓΙΑ ΧΡΗΣΤΕΣ / ΕΠΑΓΓΕΛΜΑΤΙΕΣ ΥΓΕΙΟΝΟΜΙΚΗΣ ΠΕΡΙΘΑΛΨΗΣ**

Η SSCP δεν προορίζεται να αντικαταστήσει τις Οδηγίες χρήσης ως κύριο έγγραφο για τη διασφάλιση της ασφαλούς χρήσης του ιατροτεχνολογικού προϊόντος ούτε προορίζεται να παρέχει διαγνωστικές ή θεραπευτικές προτάσεις στους προβλεπόμενους χρήστες ή ασθενείς. Η SSCP δεν προορίζεται για την αντικατάσταση των υποχρεωτικών πληροφοριών στις κάρτες εμφυτεύματος ή σε άλλα υποχρεωτικά έγγραφα.

### **1.1 Προβλεπόμενη χρήση του ιατροτεχνολογικού προϊόντος**

#### **1.1.1 Προβλεπόμενη χρήση**

Το FemoSeal™ Vascular Closure System είναι ένα ιατροτεχνολογικό προϊόν που προορίζεται για τη σύγκλειση αρτηριακής διάτρησης μετά από διαδερμικό καθετηριασμό μέσω της κοινής μηριαίας αρτηρίας.

#### **1.1.2 Ενδείξεις χρήσης**

Το FemoSeal™ Vascular Closure System ενδείκνυται για χρήση στη σύγκλειση της διάτρησης της κοινής μηριαίας αρτηρίας (αρτηριοτομή) σε ασθενείς που έχουν υποβληθεί σε διαδερμικό καθετηριασμό με χρήση επεμβατικού θηκαριού 7F (2,33 mm) ή μικρότερου.

#### **1.1.3 Αντενδείξεις ή/και περιορισμοί**

Το FemoSeal™ Vascular Closure System αντενδείκνυται σε ασθενείς με αρτηριοτομές στις οποίες έχουν χρησιμοποιηθεί θηκάρια ή προϊόντα μεγαλύτερα από 7 F (2,33 mm).

#### **1.1.4 Στοχευόμενοι πληθυσμοί ασθενών**

Η ασφάλεια και η αποτελεσματικότητα του FemoSeal™ Vascular Closure System έχουν τεκμηριωθεί σε ασθενείς ηλικίας 18 ετών και άνω, οι οποίοι έχουν υποβληθεί σε διαδερμικό καθετηριασμό με χρήση επεμβατικού θηκαριού 7F (2,33 mm) ή μικρότερου.

#### **1.1.5 Ειδικοί πληθυσμοί ασθενών**

Η ασφάλεια και η αποτελεσματικότητα του FemoSeal™ Vascular Closure System δεν έχουν τεκμηριωθεί στους ακόλουθους πληθυσμούς ασθενών:

- Ασθενείς με προϋπάρχον αυτοάνοσο νόσημα.
- Ασθενείς που υποβάλλονται σε θεραπευτική θρομβόλυση.
- Ασθενείς με κλινικά σημαντική περιφερική αγγειακή νόσο.
- Ασθενείς με μη ελεγχόμενη υπέρταση (> 220 mmHg συστολική ή > 110 mmHg διαστολική).

- Ασθενείς με αιμορραγική διαταραχή, συμπεριλαμβανομένης της θρομβοπενίας (αριθμός αιμοπεταλίων < 100.000), ή αναιμία (Hgb < 10 mg/dl).
- Ασθενείς με εσωτερικό αυλό της κοινής μηριαίας αρτηρίας μικρότερο από 5 mm.
- Ασθενείς με νεφρική ή/και ηπατική δυσλειτουργία.
- Ασθενείς με άλλη σχετική συννοσηρότητα.
- Πληθυσμός με ειδική φυλετική ή/και εθνοτική καταγωγή.
- Ασθενείς που έχουν υποστεί έμφραγμα του μυοκαρδίου εντός 72 ωρών.
- Ασθενείς με αγγειακό μόσχευμα ή ενδοπρόθεση στο σημείο διάτρησης.
- Έγκυες ασθενείς ή ασθενείς που θηλάζουν.
- Ασθενείς κάτω των 18 ετών.

#### 1.1.6 Προβλεπόμενοι χρήστες

Οι προβλεπόμενοι χρήστες του FemoSeal™ Vascular Closure System είναι ιατροί με εκπαίδευση που τους επιτρέπει τη διεξαγωγή αρτηριακής πρόσβασης και σύγκλεισης για ενδοαγγειακές επεμβάσεις μέσω της κοινής μηριαίας αρτηρίας και έχουν συμμετάσχει σε ένα πρόγραμμα εκπαίδευσης ιατρών της Terumo Medical Corporation FemoSeal™.

## 1.2 Περιγραφή τεχνολογικού προϊόντος

### 1.2.1 Περιγραφή του ιατροτεχνολογικού προϊόντος

Το FemoSeal™ Vascular Closure System, το οποίο κατασκευάζεται από την Terumo Medical Corporation (TMC), είναι ένα απορροφήσιμο ιατροτεχνολογικό προϊόν σύγκλεισης αγγείων που έχει σχεδιαστεί για να επιτύχει την αιμόσταση της μηριαίας αρτηρίας μετά από διαδερμικό καθετηριασμό μέσω της κοινής μηριαίας αρτηρίας.

Τα στοιχεία σύγκλεισης του FemoSeal™ αποτελούνται από δύο απορροφήσιμους πολυμερείς δίσκους, την εσωτερική στεγανοποίηση και τον εξωτερικό δίσκο ασφάλισης, οι οποίοι συγκρατούνται μεταξύ τους από ένα απορροφήσιμο πολύκλωνο υλικό, στεγανοποιώντας έτσι μηχανικά την αρτηριοτομή (βλ. **Εικόνα 1.1** και **Εικόνα 1.2**). Μετά την έκπτυξη μέσω του θηκαριού περιβλήματος κώνου, ο εξωτερικός δίσκος ασφάλισης επικαλύπτεται επάνω στον πολύκλωνο άξονα, με αποτέλεσμα τη μηχανική σύγκλειση του σημείου διάτρησης μεταξύ του εσωτερικού και του εξωτερικού δίσκου ασφάλισης. Η εσωτερική στεγανοποίηση και ο εξωτερικός δίσκος ασφάλισης συγκρατούνται στη θέση τους μέσω τριβής στον πολύκλωνο

άξονα. Η αιμόσταση επιτυγχάνεται με μηχανικά μέσα. Τα στοιχεία σύγκλεισης αποδομούνται μέσω υδρόλυσης.

Τα εμφυτεύσιμα συστατικά σύγκλεισης, η εσωτερική στεγανοποίηση και ο εξωτερικός δίσκος ασφάλισης αποδομούνται εντός δεκαοκτώ (18) μηνών, ενώ το πολύκλωνο υλικό εκτιμάται ότι αποδομείται και απορροφάται μέσω υδρόλυσης από τον περιβάλλοντα ιστό μετά από δύο (2) έως τρία (3) έτη. Η ικανότητα των εμφυτεύσιμων στοιχείων σύγκλεισης να διατηρούν τη συμπίεση στην αρτηριοτομή έχει δοκιμαστεί για έως και οκτώ (8) ώρες. Τα προϊόντα αποδόμησης μεταβολίζονται και απεκκρίνονται στα ούρα ή εκλύονται ως διοξείδιο του άνθρακα μέσω των πνευμόνων. Δεν παρατηρήθηκαν επιπτώσεις συσσώρευσης σε μελέτες σε πειραματόζωα. Τα πρόσθετα στοιχεία του FemoSeal™ που θα έρθουν σε επαφή με ζωντανό ιστό ή αίμα στη διάρκεια της επέμβασης είναι το θηκάρι περιβλήματος κώνου, ο διαστολέας, ο σωλήνας επικάλυψης, ο προωθητήρας και το οδηγό σύρμα.

**Εικόνα 1.1 Εσωτερική στεγανοποίηση και εξωτερικός δίσκος ασφάλισης, αντίστοιχα**

**Εικόνα 1.2 Εσωτερική στεγανοποίηση και εξωτερικός δίσκος ασφάλισης εκπτυγμένος**

Η μονάδα FemoSeal™ διατίθεται σε συσκευασία μαζί με έναν διαστολέα και ένα οδηγό σύρμα εξωτερικής διαμέτρου 0,038” (0,97 mm), μήκους 27,5” (70 cm) και ένα εργαλείο ευθυγράμμισης σχήματος J. Βλ. **Εικόνα 1.3** παρακάτω. Το οδηγό σύρμα βρίσκεται μέσα σε έναν σωλήνα πολυαιθυλενίου. Όλα τα εξαρτήματα είναι συσκευασμένα σε έναν σταθερό χάρτινο δίσκο. Η συσκευασία περιλαμβάνει επίσης την κάρτα εμφυτεύματος ασθενούς. Το FemoSeal™ Vascular Closure System δεν απαιτεί τη χρήση πρόσθετων παρελκομένων προκειμένου το

ιατροτεχνολογικό προϊόν να λειτουργεί όπως προορίζεται και το προϊόν προορίζεται για χρήση μόνο με τον διαστολέα και το οδηγό σύρμα που περιλαμβάνονται στη συσκευασία του προϊόντος.

\* Εμφυτεύσιμο τμήμα του προϊόντος, τα εμφυτεύσιμα εξαρτήματα είναι ασφαλή για μαγνητική τομογραφία

Το FemoSeal™ VCS αποστειρώνεται με οξείδιο του αιθυλενίου (EO) και αποτελεί ιατροτεχνολογικό προϊόν μίας χρήσης. Το FemoSeal™ VCS είναι σχεδιασμένο με τέτοιο τρόπο ώστε να μην μπορεί να επαναχρησιμοποιηθεί.

### **Τρόπος λειτουργίας**

Το FemoSeal™ VCS προάγει τη μηχανική αιμόσταση εκπύσσοντας εμφυτεύσιμα στοιχεία σύγκλεισης εντός και εκτός της κοινής μηριαίας αρτηρίας. Ο μηχανισμός που αποτρέπει την αιμορραγία παρέχεται από την εσωτερική στεγανοποίηση, η οποία στεγανοποιεί το σημείο διάτρησης, και τον εξωτερικό δίσκο ασφάλισης που συγκρατεί την εσωτερική στεγανοποίηση στη θέση της.

#### **1.2.3 Κλινικό όφελος**

Το FemoSeal™ VCS παρέχει τα ακόλουθα κλινικά οφέλη σχετικά με τη σύγκλειση αγγείων μετά από διάτρηση της κοινής μηριαίας αρτηρίας:

- Μείωση χρόνου έως την αιμόσταση<sup>1</sup>
- Μείωση χρόνου έως το περιπατητικό στάδιο<sup>1</sup>

#### **1.2.4 Προηγούμενη γενιά/ γενιές ή παραλλαγές**

- Η πρώτη έκδοση του FemoSeal™ VCS (αριθ. 11200) πωλήθηκε στην ευρωπαϊκή αγορά κατά τη διάρκεια του έτους 2005 και μέρους του 2006.
- Το τρέχον FemoSeal™ VCS (αριθ. 11202), με βελτιωμένο σύστημα χορήγησης, είναι διαθέσιμο στην αγορά από τις 28 Μαρτίου 2006.

#### **1.2.5 Παρελκόμενα που προορίζονται για χρήση σε συνδυασμό με το ιατροτεχνολογικό προϊόν**

Η μονάδα FemoSeal™ παρέχεται σε συσκευασία με έναν διαστολέα, οδηγό σύρμα 0,038” (0,97 mm) OD, μήκους 27,5” (70 cm) και εργαλείο ευθυγράμμισης σχήματος J. Το οδηγό σύρμα αποτελεί παρελκόμενο της μονάδας FemoSeal™. Η διάταξη ευθυγράμμισης σχήματος J αποτελεί εξάρτημα του οδηγού σύρματος, ενώ ο διαστολέας αποτελεί εξάρτημα της μονάδας FemoSeal™. Το οδηγό σύρμα είναι το μόνο εξάρτημα που θεωρείται παρελκόμενο. Το οδηγό σύρμα βρίσκεται μέσα σε έναν σωλήνα πολυαιθυλενίου. Όλα τα εξαρτήματα είναι συσκευασμένα σε έναν σταθερό χάρτινο δίσκο. Η συσκευασία περιλαμβάνει επίσης την κάρτα εμφυτεύματος ασθενούς. Το FemoSeal™ Vascular Closure System δεν απαιτεί τη χρήση πρόσθετων παρελκομένων προκειμένου το ιατροτεχνολογικό προϊόν να λειτουργεί όπως προορίζεται και το προϊόν

προορίζεται για χρήση μόνο με τον διαστολέα και το οδηγό σύρμα που περιλαμβάνονται στη συσκευασία του προϊόντος.

### 1.2.6 Άλλα ιατροτεχνολογικά προϊόντα και προϊόντα που προορίζονται για χρήση σε συνδυασμό με το ιατροτεχνολογικό προϊόν

Το FemoSeal™ VCS δεν απαιτεί τη χρήση πρόσθετων προϊόντων για να λειτουργεί όπως προορίζεται.

## 1.3 Κίνδυνοι και προειδοποιήσεις

### 1.3.1 Υπολειπόμενοι κίνδυνοι και ανεπιθύμητες ενέργειες

Γνωστά ή προβλέψιμα ανεπιθύμητα συμβάντα, βλάβες και επιπλοκές που σχετίζονται με τη χρήση του FemoSeal™ VCS ως αποτέλεσμα των υπολειπόμενων κινδύνων παρατίθενται στον **Πίνακα 1.2**. Το ποσοστό εμφάνισης βασίζεται σε μια ανάλυση της τεκμηρίωσης κινδύνου και υπολογίζεται με βάση τα δεδομένα παρακολούθησης μετά την κυκλοφορία του προϊόντος στην αγορά από την 1η Σεπτεμβρίου 2019 έως την 31η Αυγούστου 2024. Δεν υπάρχουν άγνωστοι υπολειπόμενοι κίνδυνοι για το FemoSeal™ VCS και όλοι οι ισχύοντες κίνδυνοι έχουν αντιμετωπιστεί μέσω των οδηγιών χρήσης και της διαδικασίας διαχείρισης κινδύνων.

### 1.3.2 Προειδοποιήσεις και προφυλάξεις

#### Προειδοποιήσεις

- Μη χρησιμοποιείτε το προϊόν εάν η συσκευασία έχει υποστεί φθορά ή ο στείρος φραγμός δεν είναι άθικτος.
- Να μη χρησιμοποιείται μετά την ημερομηνία λήξης – η απόδοση των βιοαποικοδομήσιμων εξαρτημάτων ενδέχεται να μην είναι επαρκής.
- Μη χρησιμοποιείτε το προϊόν, εάν οποιαδήποτε στοιχεία φαίνεται να έχουν υποστεί ζημιά ή να είναι ελαττωματικά με οποιονδήποτε τρόπο.
- Η χρήση του FemoSeal™ Vascular Closure System όταν ενδέχεται να έχει προκληθεί βακτηριακή επιμόλυνση του επεμβατικού θηκαριού ή του περιβάλλοντος ιστού, μπορεί να προκαλέσει μόλυνση.
- Εάν υπάρχει υποψία ότι το οπίσθιο αρτηριακό τοίχωμα έχει διατρηθεί ή έχουν γίνει περισσότερες από μία αρτηριακές διατρήσεις, μη βασίζεστε αποκλειστικά στο

FemoSeal™ Vascular Closure System για την επίτευξη αρτηριακής αιμόστασης.  
Εφαρμόστε πρόσθετη χειροκίνητη ή μηχανική συμπίεση.

6. Εάν το σημείο διάτρησης βρίσκεται στη διακλάδωση της μηριαίας αρτηρίας ή περιφερικά σε αυτήν, το FemoSeal™ Vascular Closure System δεν θα πρέπει να χρησιμοποιείται, λόγω του κινδύνου εσφαλμένης τοποθέτησης της εσωτερικής στεγανοποίησης. Αυτό το συμβάν μπορεί να οδηγήσει σε αιμορραγικές επιπλοκές ή/και διατάραξη της φυσιολογικής ροής του αίματος.
7. Εάν εξακολουθεί να παρατηρείται αρτηριακή αιμορραγία από το σημείο της τομής, μην κόβετε το πολύκλωνο υλικό μέχρι να επιτευχθεί αιμόσταση. Εάν δεν επιτευχθεί αιμόσταση, στερεώστε το πολύκλωνο υλικό με ένα αποστειρωμένο επίθεμα τραύματος και εφαρμόστε συμπληρωματική συμπίεση, μέχρι να επιτευχθεί αιμόσταση. Σε περίπτωση εμμένουσας αρτηριακής αιμορραγίας, ενδέχεται να παρουσιαστούν σημαντικές αιμορραγικές επιπλοκές, οι οποίες ενδέχεται να οδηγήσουν σε τραυματισμό ή τον θάνατο του ασθενούς.
8. Μη χρησιμοποιείτε το FemoSeal™ Vascular Closure System εάν το σημείο διάτρησης είναι κοντά στον βουβωνικό σύνδεσμο, καθώς αυτό μπορεί να οδηγήσει σε οπισθοπεριτοναϊκό αιμάτωμα.
9. Οι ασθενείς με υψηλότερο κίνδυνο αιμορραγίας ενδέχεται να παρουσιάσουν αυξημένη απώλεια αίματος, η οποία απαιτεί μετάγγιση.
10. Εάν ο εσωτερικός δίσκος αποσπαστεί, μπορεί δυνητικά να προκαλέσει θρομβωτικό ή/και εμβολικό συμβάν.

### Προφυλάξεις

1. Η διαδικασία έκπτυξης του FemoSeal™ Vascular Closure System θα πρέπει να πραγματοποιείται από ιατρούς με κατάλληλη εκπαίδευση στη χρήση του ιατροτεχνολογικού προϊόντος.
2. Εκτελέστε μια περιορισμένη μηριαία αγγειογραφία ή μια μηριαία διάτρηση με υπερηχογραφική καθοδήγηση πριν από την έκπτυξη του FemoSeal™ Vascular Closure System.
3. Διακόψτε τη διαδικασία στις εξής περιπτώσεις:
  - Διάμετρος αυλού κοινής μηριαίας αρτηρίας < 5 mm.
  - Παρουσία στένωσης ή/και σημαντικής πλάκας κοντά στο σημείο διάτρησης της κοινής μηριαίας αρτηρίας.
  - Η αρτηριακή διάτρηση βρίσκεται στη διακλάδωση της μηριαίας αρτηρίας ή περιφερικά αυτής.

- ο Παρουσία ανώμαλων διακλαδώσεων ή ανωμαλιών αγγείων κοντά στο σημείο διάτρησης της κοινής μηριαίας αρτηρίας.
- 4. Εάν υπάρχει αιμάτωμα, απαιτείται ιδιαίτερη προσοχή για τη σωστή εισαγωγή του θηκαριού περιβλήματος κώνου στην αρτηρία.
- 5. Εφαρμόζετε τεχνική διάτρησης μονού τοιχώματος. Μην τρυπάτε το οπίσθιο τοίχωμα της αρτηρίας.
- 6. Τηρείτε πάντοτε την τεχνική αποστείρωσης όταν χρησιμοποιείτε το FemoSeal™ Vascular Closure System.
- 7. Το FemoSeal™ Vascular Closure System προορίζεται για μία μόνο χρήση και δεν πρέπει να επαναποστειρώνεται ή να επαναχρησιμοποιείται με οποιονδήποτε τρόπο. Η μονάδα FemoSeal™ είναι σχεδιασμένη με τέτοιο τρόπο ώστε να μην μπορεί να επαναχρησιμοποιηθεί.
- 8. Εάν κατά την έκπτυξη της εσωτερικής στεγανοποίησης αισθανθείτε μη αναμενόμενη αντίσταση, διακόψτε τη διαδικασία.
- 9. Για τη σωστή έκπτυξη της εσωτερικής στεγανοποίησης, επανατοποθετήστε τον αντίχειρά σας έτσι ώστε το κουμπί να μπορεί να επανέλθει ελεύθερα.
- 10. Βεβαιωθείτε ότι το άκρο του θηκαριού περιβλήματος κώνου της μονάδας FemoSeal™ βρίσκεται κάτω από την επιφάνεια του δέρματος πριν από την έκπτυξη του εξωτερικού δίσκου ασφάλισης. Ο εξωτερικός δίσκος ασφάλισης μπορεί να εκπτυχθεί ακούσια πάνω από το επίπεδο του δέρματος σε ασθενείς με μικρή απόσταση μεταξύ της μηριαίας αρτηρίας και του επιπέδου του δέρματος.
- 11. Για τη σωστή έκπτυξη ενδέχεται να είναι απαραίτητη μια τομή στο δέρμα πριν από την έκπτυξη.
- 12. Εάν η εσωτερική στεγανοποίηση βρίσκεται εντός της αρτηρίας, αλλά δεν είναι δυνατό να πατηθεί πλήρως το κουμπί και να εκπτυχθεί ο εξωτερικός δίσκος ασφάλισης, ενδέχεται να απαιτείται χειρουργική επέμβαση για την αφαίρεση των στοιχείων του FemoSeal™ Closure.
- 13. Εάν απαιτείται νέα διάτρηση της ίδιας μηριαίας αρτηρίας εντός 18 μηνών, η νέα διάτρηση θα πρέπει να πραγματοποιηθεί τουλάχιστον ένα εκατοστό εγγύς της προηγούμενης θέσης πρόσβασης του FemoSeal™ Vascular Closure System.
- 14. Ζητήστε από τον ασθενή να ακολουθήσει τις οδηγίες του ιατρού σχετικά με τον έλεγχο του σημείου σύγκλεισης.
- 15. Ζητήστε από τον ασθενή να έχει μαζί του την Κάρτα πληροφοριών ασθενούς για τους επόμενους 18 μήνες

### **Προφυλάξεις κατά την έκδοση εξιτηρίου**

Πριν εξετάσετε το ενδεχόμενο έκδοσης εξιτηρίου, αξιολογήστε τον ασθενή για τις ακόλουθες κλινικές καταστάσεις:

1. Αιμορραγία ή/και αιμάτωμα στο σημείο σύγκλεισης.
2. Πόνος κατά το περπάτημα.
3. Ενδείξεις μόλυνσης στο σημείο σύγκλεισης.

### **1.3.3 Διορθωτικά μέτρα ασφαλείας κατά τη χρήση**

Εφαρμόστηκε μία Επιτόπια διορθωτική ενέργεια ασφάλειας σχετικά με το FemoSeal™ VCS στο χρονικό διάστημα από την 1η Σεπτεμβρίου 2019 έως την 31η Αυγούστου 2024.

Το 2022, η Terumo προέβη σε εθελοντική ανάκληση του FemoSeal™ VCS λόγω καταγγελιών σχετικά με αποτυχίες στη διαδικασία και τη δοκιμή αποδέσμευσης παρτίδας του προϊόντος FemoSeal που κατασκευάστηκε από την Elkton για τη μέτρηση της δύναμης συμπίεσης και της δύναμης συστολής. Συνολικά ανακλήθηκαν 950 μονάδες από τη Νότια Κορέα.

### **1.4 Κλινική αξιολόγηση και κλινική παρακολούθηση μετά την κυκλοφορία του προϊόντος στην αγορά**

Στον **Πίνακα 1.3** περιλαμβάνεται ένας κατάλογος βασικών μελετών που περιλήφθηκαν για τη διάθεση του FemoSeal™ VCS στην αγορά καθώς και μελετών μετά την κυκλοφορία του προϊόντος στην αγορά και δραστηριοτήτων κλινικής παρακολούθησης μετά την κυκλοφορία του προϊόντος στην αγορά. Η έκδοση του ιατροτεχνολογικού προϊόντος που χρησιμοποιείται στη μελέτη περιλαμβάνεται στον παρακάτω πίνακα. Η πρώτη έκδοση του FemoSeal™ VCS (αριθ. 11200) διατέθηκε στην αγορά μέχρι το 2006, ενώ η επόμενη έκδοση (αριθ. C11202) διατέθηκε στην αγορά το 2006 και είναι η τρέχουσα έκδοση που διατίθεται στην αγορά σήμερα.

**Πίνακας 1.3 Σύνοψη βασικών μελετών**

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Διεξήχθη από την Biomatech, Γαλλία | Μελέτη σε ζώα | Σκοπός της μελέτης ήταν η αξιολόγηση της βιοσυμβατότητας και της βιολειτουργικότητας ενός βιοαποικοδομήσιμου εμφυτεύματος, σχεδιασμένου για την επίτευξη αιμόστασης στο αγγειακό σύστημα. Το ιατροτεχνολογικό προϊόν που ελέγχθηκε προορίζεται να εισέλθει στην οπή διάτρησης σε αρτηρίες για την επίτευξη αιμόστασης. Ο ένας δίσκος εισήλθε στην οπή διάτρησης της αρτηρίας και ο άλλος συμπίεσε τον εσωτερικό δίσκο από το εξωτερικό της αρτηρίας. Και οι δύο δίσκοι εισήχθησαν μέσω ενός θηκαριού εισαγωγής. Οι δίσκοι σχεδιάστηκαν για να αποτρέπουν την αιμορραγία, να επουλώνονται στο τοίχωμα του αγγείου και τελικά να αποδομούνται και να απορροφούνται. Η μελέτη σχεδιάστηκε για τη συλλογή και την ανάλυση δεδομένων μετά από λειτουργική εμφύτευση σε προβατοειδή και χοίρους, για την αξιολόγηση της ικανότητας του εμφυτεύματος να διατηρεί φυσιολογική λειτουργία, όταν χρησιμοποιείται στο κυκλοφορικό σύστημα, για τον προσδιορισμό της απόκρισης του ξενιστή και της απόκρισης του ιατροτεχνολογικού προϊόντος (φυσική ακεραιότητα, ενθυλάκωση | Η περίοδος εμφύτευσης/ παρακολούθησης είναι 5 εβδομάδες για όλα τα πειραματόζωα<br><br>4 πρόβατα, 1 χοίρος<br><br>14 στοιχεία σύγκλεισης<br><br>8 στοιχεία σύγκλεισης εμφυτευμένα σε 2 πρόβατα,<br><br>2 στοιχεία σύγκλεισης εμφυτευμένα σε 1 χοίρο<br><br>Όταν εμφυτεύθηκαν δύο στοιχεία σύγκλεισης στην ίδια μηριαία αρτηρία, εμφυτεύθηκαν σε απόσταση > 30 mm | Καταγράφηκαν κριτήρια τυχόν ανεπιθύμητων συμβάντων (φλεγμονή, νέκρωση, αιμορραγία ή οποιαδήποτε άλλη βλάβη) ή τυχόν σχηματισμός λεπτού ψευδο-εσωχιτώνιου στρώματος. Ιδιαίτερη προσοχή δόθηκε στην αρχική ενσωμάτωση του ιατροτεχνολογικού προϊόντος στον ιστό, με έμφαση στην ενθυλάκωση του εσωτερικού δίσκου.<br><br>Μακροσκοπικά, δεν παρατηρήθηκαν σημαντικές ενδείξεις τοπικής δυσανεξίας ή σχηματισμού θρόμβου. Η μακροσκοπική παρατήρηση δεν αποκάλυψε καμία διαφορά μεταξύ του προβάτου ή του χοίρου μετά την εμφύτευση των στοιχείων σύγκλεισης στις μηριαίες αρτηρίες. Μακροσκοπικά, δεν παρατηρήθηκαν σημαντικές ενδείξεις τοπικής δυσανεξίας ή σχηματισμού θρόμβου. Η μακροσκοπική παρατήρηση δεν αποκάλυψε καμία διαφορά μεταξύ του προβάτου ή του χοίρου μετά την εμφύτευση των στοιχείων σύγκλεισης στις μηριαίες αρτηρίες.<br><br>Η ιστολογική ανάλυση της θέσης εμφύτευσης σε πρόβατα δεν έδειξε τοπικές ανεπιθύμητες αντιδράσεις. Οι |

|  |  |  | ιστού) και για την αξιολόγηση της αποδόμησης του εμφυτεύματος |  | <p>εσωτερικοί και εξωτερικοί δίσκοι παρουσίασαν ενδείξεις αποδόμησης και σε ορισμένες περιπτώσεις διασπάστηκαν σε μικρότερα μέρη. Οι εσωτερικοί δίσκοι ενσωματώθηκαν πλήρως στον νεο-εσωχιτώνιο ιστό. Στον χοίρο, η ιστολογική ανάλυση αποκάλυψε ελαφρώς περισσότερες φλεγμονώδεις ενδείξεις γύρω από τους εσωτερικούς και εξωτερικούς δίσκους. Και στα δύο πειραματόζωα, το πολυκύκλωνο παρουσίασε ελαφρώς περισσότερες φλεγμονώδεις ενδείξεις σε σχέση με το υλικό του δίσκου, γεγονός φυσιολογικό για τα πλεκτά ράμματα, λόγω της μεγαλύτερης επιφάνειας.</p> <p>Η βατότητα των αγγείων μετρήθηκε μετά από 5 εβδομάδες με χρήση τριών διαφορετικών μεθόδων - ιστομορφομετρική, ιστομορφομετρική σε συνδυασμό με μέτρηση της διαμέτρου του αγγείου με χρήση παχύμετρου και με χρήση υπερηχογραφήματος έγχρωμου doppler. Η μέση βατότητα των αγγείων στα πρόβατα ήταν μεταξύ 60 και 80%, ανάλογα με τη μέθοδο (12 παρατηρήσεις). Στον χοίρο, η μέση βατότητα στο αγγείο ήταν μεταξύ 40% και 80% (2 παρατηρήσεις).</p> |

|--|--|--|--|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Στο πλαίσιο του σχεδίου ανάπτυξης πριν από τη διάθεση στην αγορά για το FemoSeal™ VCS, ολοκληρώθηκαν 3 λειτουργικές δοκιμές σε πειραματόζωα. Το 2000, πριν από την έναρξη κλινικών μελετών, πραγματοποιήθηκε μια μελέτη σε πειραματόζωα για την αξιολόγηση της βιολειτουργικότητας του FemoSeal™ VCS. Η μελέτη αυτή αξιολόγησε την ικανότητα των στοιχείων σύγκλεισης στη διατήρηση της φυσιολογικής λειτουργίας και την αποδόμησή τους. Στους 18 μήνες, το υλικό του εσωτερικού και του εξωτερικού δίσκου δεν ήταν πλέον ορατό, έχοντας αντικατασταθεί από έναν ενδοαυλικό ινώδη ιστό. Συμπερασματικά, επιβεβαιώθηκε η δυνατότητα του στοιχείου σύγκλεισης του FemoSeal™ VCS να διατηρεί τη φυσιολογική λειτουργία, όταν χρησιμοποιείται στο κυκλοφορικό σύστημα.

Το 2002 πραγματοποιήθηκε μελέτη σε πειραματόζωα για την αξιολόγηση της βιοσυμβατότητας ενός βιοαποικοδομήσιμου εμφυτεύματος, του FemoSeal™ VCS, σχεδιασμένου για την επίτευξη αιμόστασης στο αγγειακό σύστημα. Περιληπτικά, η αποδόμηση του εμφυτεύματος είχε σχεδόν ολοκληρωθεί έως τις 36 εβδομάδες και δεν παρατηρήθηκε σημαντική ανεπιθύμητη αντίδραση στον ιστό.

Μια άλλη μελέτη σε πειραματόζωα το 2002 αξιολόγησε τη βιοσυμβατότητα και τη βιολειτουργικότητα ενός βιοαποικοδομήσιμου εμφυτεύματος, του FemoSeal™ VCS, σχεδιασμένου για την επίτευξη αιμόστασης στο αγγειακό σύστημα. Μετά από 5 εβδομάδες, η ενθυλάκωση του δίσκου είχε ολοκληρωθεί και παρατηρήθηκαν ενδείξεις αποδόμησης των εσωτερικών και εξωτερικών δίσκων. Συμπερασματικά, επιβεβαιώθηκε η δυνατότητα του εμφυτεύματος να διατηρεί τη φυσιολογική λειτουργία, όταν χρησιμοποιείται στο κυκλοφορικό σύστημα.

Στο πλαίσιο του σχεδίου κλινικής ανάπτυξης για το FemoSeal™ VCS, η Radi Medical System AB διεξήγαγε μια κλινική έρευνα πριν από τη διάθεση στην αγορά. Αυτή η κλινική έρευνα δεν δημοσιεύτηκε ή δεν είναι διαθέσιμη ηλεκτρονικά. Η μελέτη με το μοντέλο ιατροτεχνολογικού

προϊόντος #11200 πραγματοποιήθηκε το 2002-2004 στο πλαίσιο του Ευρωπαϊκού Προτύπου EN 540 (Κλινική Διερεύνηση Ιατροτεχνολογικών Προϊόντων για Ανθρώπους) και σύμφωνα με τα Γενικά Ζητήματα ICH για τις Κλινικές Δοκιμές και την Οδηγία για την Ορθή Κλινική Πρακτική. Οι λεπτομέρειες αυτής της μελέτης τεκμηριώνονται στην έκθεση EU-SE-001. Η κλινική δοκιμή καταγράφηκε στην Τελική Έκθεση από τη Radi Medical Systems AB, «Πολυκεντρική κλινική δοκιμή του Συστήματος σύγκλεισης αγγείων FemoSeal για τη στεγανοποίηση των διατρήσεων μηριαίων αρτηριών μετά από διαγνωστικές/ επεμβατικές καρδιολογικές διαδικασίες». Η κλινική μελέτη πραγματοποιήθηκε με το πρώτο μοντέλο αριθ. 11200 του FemoSeal™ και εστίασε στην ασφάλεια και την αποτελεσματικότητα των εμφυτεύσιμων στοιχείων σύγκλεισης. Η μόνη διαφορά μεταξύ του πρώτου μοντέλου αριθ. 11200 και του τρέχοντος μοντέλου, C11202, είναι το μέγεθος French, 6F και 7F αντίστοιχα, και το βελτιωμένο σύστημα χορήγησης. Τα κλινικά οφέλη, η προβλεπόμενη χρήση, οι αρχές λειτουργίας και οι πρώτες ύλες των εμφυτεύσιμων στοιχείων σύγκλεισης, της εσωτερικής στεγανοποίησης και του εξωτερικού δίσκου ασφάλισης παραμένουν αμετάβλητα.

Η προβλεπόμενη χρήση του ιατροτεχνολογικού προϊόντος αφορούσε ασθενείς που υποβλήθηκαν σε διαγνωστικές ή επεμβατικές καρδιακές διαδικασίες/ επεμβάσεις με χρήση της μηριαίας αρτηρίας ως σημείο πρόσβασης. Στόχος της παρούσας μελέτης ήταν ο καθορισμός της ασφάλειας, της απόδοσης και της αποτελεσματικότητας του FemoSeal™ VCS. Η μελέτη ήταν μια προοπτική, πολυκεντρική μελέτη, ανοικτής ετικέτας, ενός σκέλους, με παρακολούθηση 30 ημερών.

Το πρωτεύον τελικό σημείο απόδοσης ήταν ο χρόνος έως την επίτευξη αιμόστασης που ορίστηκε ως η απουσία έντονης αιμορραγίας. Το πρωτεύον τελικό σημείο ασφάλειας ήταν η εμφάνιση σοβαρών αγγειακών επιπλοκών έως και 30 ημέρες αργότερα. Στα δευτερεύοντα τελικά σημεία περιλαμβάνονταν ο χρόνος έως το περιπατητικό στάδιο, το ποσοστό αποτυχιών θεραπείας, ο επιπολασμός των ανεπιθύμητων συμβάντων και τα χαρακτηριστικά απόδοσης του ιατροτεχνολογικού προϊόντος κατά τη διάρκεια της χορήγησης και της έκπτυξης.

Οι ασθενείς που συμπεριλήφθηκαν σε αυτήν τη μελέτη ήταν ενήλικες που μπόρεσαν να παράσχουν συναίνεση κατόπιν ενημέρωσης και με τουλάχιστον έναν ακέραιο πελματιαίο σφυγμό. Οι ασθενείς αποκλείστηκαν από τη μελέτη εάν είχαν κάποια από τις ακόλουθες καταστάσεις:

- Ιστορικό περιφερικής αγγειακής νόσου
- Αυτοάνοσο νόσημα
- Γνωστή αιμορραγική διαταραχή βαριάς αναιμίας
- INR > 1,5
- Έμφραγμα του μυοκαρδίου εντός 72 ωρών

- Μη ελεγχόμενη υπέρταση παρά τη θεραπεία
- Παχυσαρκία που αποκλείει την πρόσβαση με τεχνική Seldinger
- Παρουσία αγγειακού μοσχεύματος ή ενδοπρόθεσης στο σημείο της αρτηριοτομής
- Προηγούμενη ομόπλευρη διάτρηση εντός 3 μηνών
- Προσδόκιμο ζωής < 6 μήνες

Επιπλέον, οι ασθενείς εξετάστηκαν ενδοεγχειρητικά και αποκλείστηκαν από τη μελέτη εάν παρατηρήθηκε οποιοδήποτε από τα ακόλουθα:

- Διάμετρος αυλού κοινής μηριαίας αρτηρίας < 5 mm
- Αρτηριακές διακλαδώσεις σε απόσταση 2 cm εγγύς του σημείου διάτρησης
- Σημαντική στένωση εντός 3 cm από το σημείο διάτρησης
- Χρήση του κύριου θηκαριού εισαγωγέα > 6 Fr
- Διάτρηση στο σημείο της μηριαίας διακλάδωσης ή περιφερικά αυτού
- Πολλαπλές μηριαίες διατρήσεις
- Γνωστή ή πιθανολογούμενη διάτρηση του οπίσθιου μηριαίου τοιχώματος
- Μεγάλο αιμάτωμα (2:6 cm) κατά την ολοκλήρωση της επέμβασης
- Δυσκολία εισαγωγής του πρωτεύοντος θηκαριού για την επέμβαση λόγω δυσχερούς ιστού ή αγγείου

Αυτή η μελέτη μονού πρωτοκόλλου πραγματοποιήθηκε σε δύο μέρη: Στη διάρκεια του Μέρους 1 εντάχθηκαν 20 ασθενείς. Ολοκληρώθηκε μια ανάλυση ασφάλειας και, στη συνέχεια, εντάχθηκαν επιπλέον 60 ασθενείς κατά το Μέρος 2.

Στο Μέρος 1, η μέση ηλικία των ενταγμένων ασθενών ήταν 65,9 έτη, το 70,0% των ασθενών ήταν άνδρες και το 95% των ασθενών λάμβανε συγχρησιμοποιούμενα φάρμακα. Στο Μέρος 2 της μελέτης, η μέση ηλικία ήταν 63,8 έτη, το 78% ήταν άντρες και το 100% λάμβανε συγχρησιμοποιούμενα φάρμακα.

Οι ασθενείς που υποβλήθηκαν σε διαγνωστικές (Μέρος 1 και Μέρος 2) ή επεμβατικές (Μέρος 2) διαδικασίες καρδιακού καθετηριασμού ήταν επιλέξιμοι για συμμετοχή στη μελέτη. Οι διαδικασίες ήταν σύμφωνες με την καθιερωμένη θεραπεία σε καθένα από τα εγχευόμενα νοσοκομεία, ενώ ακολούθησε η χρήση του FemoSeal™ VCS. Τα δεδομένα ασθενών συλλέχθηκαν κατά την εκκίνηση, κατά τη διάρκεια της διαδικασίας και σε διάστημα 1 ημέρας και 30 ημερών μετά την επέμβαση. Τα αποτελέσματα συνοψίζονται στον **Πίνακα 1.5** και υποδεικνύουν ότι το FemoSeal™ VCS είναι ασφαλές και αποτελεσματικό για χρήση σε αυτόν τον πληθυσμό ασθενών.

**Πίνακας 1.5 Κλινικά αποτελέσματα που αναφέρθηκαν στη μελέτη πριν από την κυκλοφορία του προϊόντος στην αγορά**

| Δυσλειτουργίες ιατροτεχνολογικού προϊόντος                                                                   | 0 (0%)     | 6 (10%)                 |

<sup>α</sup>Βάσει του συνολικού μεγέθους δείγματος 58, καθώς 2 ασθενείς δεν παρουσίασαν επίτευξη αιμόστασης κατά τη διάρκεια της διαδικασίας, λόγω προηγούμενων ομόπλευρων διατρήσεων. Αιμόσταση επιτεύχθηκε στα 7 λεπτά και στα 37 λεπτά σε αυτούς τους ασθενείς.

<sup>β</sup>Βάσει συνολικού μεγέθους δείγματος 59: 1 ασθενής δεν συμπεριλήφθηκε, καθώς τοποθετήθηκε σε αναπνευστήρα λόγω πνευμονικού οιδήματος και δεν ήταν περιπατητικός για περισσότερο από μία εβδομάδα.

<sup>γ</sup>Οριζόμενη ως αγγειακή επιπλοκή που απαιτεί μετάγγιση αίματος ή χειρουργική αποκατάσταση ή τοπική λοίμωξη που απαιτεί χορήγηση αντιβιοτικών, νοσηλεία ή παράταση της νοσηλείας ή χειρουργικό καθαρισμό του σημείου

Δεν παρατηρήθηκαν σοβαρές αγγειακές επιπλοκές στο Μέρος 1 της μελέτης. Αναφέρθηκε 1 σοβαρή αγγειακή επιπλοκή στο Μέρος 2 της μελέτης: ψευδοανεύρυσμα που αναφέρθηκε εντός μίας ημέρας μετά την επέμβαση. Για το συμβάν απαιτήθηκε συμπίεση με καθοδήγηση υπερηχογραφήματος και χορήγηση θρομβίνης στο ψευδοανεύρυσμα, ενώ παρατάθηκε η νοσηλεία του ασθενούς.

Από τα 5 ανεπιθύμητα συμβάντα που αναφέρθηκαν στο Μέρος 1 της μελέτης, παρουσιάστηκε 1 πιθανώς σχετιζόμενο με το ιατροτεχνολογικό προϊόν ανεπιθύμητο συμβάν: ένα μη σοβαρό συμβάν έντονης αιμορραγίας την 1η ημέρα μετεγχειρητικά. Από τα 19 ανεπιθύμητα συμβάντα

που αναφέρθηκαν στο Μέρος 2 της μελέτης, παρατηρήθηκαν 3 μη σοβαρά ανεπιθύμητα συμβάντα αιματώματος που σχετίζονται με το ιατροτεχνολογικό προϊόν και 6 πιθανώς σχετιζόμενα με το ιατροτεχνολογικό προϊόν μη σοβαρά συμβάντα, συμπεριλαμβανομένων 3 αναφορών εμμένοντος εξιδρώματος, 2 αιματωμάτων και 1 πόνου στα πόδια μετά την άσκηση.

Στο Μέρος 2 υπήρξαν 3 ασθενείς για τους οποίους η θεραπεία θεωρήθηκε αποτυχημένη: 2 λόγω αποτυχίας επίτευξης αιμόστασης χωρίς τη χρήση συμπίεσης και 1 λόγω της σοβαρής αγγειακής επιπλοκής (ψευδοανεύρυσμα). Δεν παρατηρήθηκαν αποτυχίες θεραπείας στο Μέρος 1 της μελέτης.

Από τις έξι δυσλειτουργίες του ιατροτεχνολογικού προϊόντος στο Μέρος 2 της μελέτης, τρεις δεν επηρέασαν τη διαδικασία, μία καταλογίστηκε σε σφάλμα του χρήστη, μία αφορούσε διαρροή του εισαγωγέα και μία θραύση άρθρωσης νήματος. Τα δύο τελευταία ζητήματα διευθετήθηκαν με ενημερώσεις μοντέλων που εφαρμόστηκαν το C11202.

Το Μέρος 2 της κλινικής μελέτης πριν από τη διάθεση στην αγορά δεν ανέφερε τα αποτελέσματα παρακολούθησης διάρκειας 6 μηνών, λόγω μη συμμόρφωσης του ασθενούς. Η κλινική μελέτη πριν από τη διάθεση στην αγορά (EU-SE-001) 30 ημερών, η οποία είναι σύμφωνη με τη χρονική περίοδο παρακολούθησης της κλινικής βιβλιογραφίας, καταδεικνύει ότι το FemoSeal™ VCS είναι ασφαλές και αποτελεσματικό.

#### 1.4.2 Σύνοψη δεδομένων από κλινικές έρευνες μετά από την κυκλοφορία του προϊόντος στην αγορά

Υπάρχουν 4 ολοκληρωμένες κλινικές μελέτες μετά την κυκλοφορία του προϊόντος στην αγορά που περιγράφονται στον Πίνακα 1.6 παρακάτω. Αυτές οι κλινικές έρευνες δεν δημοσιεύονται ή δεν είναι διαθέσιμες ηλεκτρονικά.

**Πίνακας 1.6 Κλινικές μελέτες μετά την κυκλοφορία του προϊόντος στην αγορά**

|  |  |  |  |  | αντίσταση στην έκπτυξη σε 226 (98,3%) των περιστατικών.<br>Σε 152/230 (66,1%) ασθενείς χρησιμοποιήθηκε οδηγό σύρμα που περιλαμβάνεται στο κιτ FemoSeal™ (GW 0,038") και συνιστάται στο FemoSeal™ χωρίς αναφερόμενες ελλείψεις του ιατροτεχνολογικού προϊόντος ή ανεπιθύμητα συμβάντα. |
|--|--|--|--|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Η μελέτη του 2006 πραγματοποιήθηκε για την επιβεβαίωση της ασφάλειας και της αποτελεσματικότητας του τρέχοντος ιατροτεχνολογικού προϊόντος με ένα βελτιωμένο σύστημα χορήγησης και για τη λήψη ανατροφοδότησης σχετικά με τις οδηγίες χρήσης και το πρόγραμμα εκπαίδευσης του FemoSeal™ VCS. Η μελέτη περιελάμβανε 100 ασθενείς και το πρωτεύον τελικό σημείο ήταν η επίτευξη αιμόστασης ή η ανάγκη πρόσθετων χειροκίνητων ή μηχανικών συμπίεσεων. Αυτή η μελέτη κατέληξε στο συμπέρασμα ότι η εφαρμογή του FemoSeal™ VCS ήταν επιτυχής στην πλειοψηφία των περιπτώσεων (91% επίτευξη άμεσης αιμόστασης).

Η μελέτη του 2008 περιελάμβανε 50 ασθενείς για την αξιολόγηση της ασφάλειας και της απόδοσης του FemoSeal™ VCS κατά την χρήση στη συνήθη κλινική ρουτίνα σε ασθενείς που υποβάλλονται σε καρδιακό καθετηριασμό με θηκάρι 7 Fr. Το πρωτεύον τελικό σημείο για τη μελέτη ήταν η συλλογή δεδομένων σχετικά με τον χρόνο επίτευξης αιμόστασης και τον χρόνο έως το περιπατητικό στάδιο χωρίς πρόσθετη συμπίεση, χειροκίνητη ή μηχανική. Τα αποτελέσματα της μελέτης κατέληξαν στο συμπέρασμα ότι ο μέσος χρόνος επίτευξης αιμόστασης ήταν 57,8 δευτερόλεπτα και όλοι οι ασθενείς ήταν δυνατό να μεταβούν στο περιπατητικό στάδιο μετά από 4 ώρες ανάπαυσης.

Η μελέτη του 2009 αφορούσε την αξιολόγηση της νέας συσκευασίας του FemoSeal™ VCS. Στη μελέτη συμπεριλήφθηκαν 25 ασθενείς. Το πρωτεύον τελικό σημείο αφορούσε το εάν ο χρήστης αντιμετώπισε προβλήματα με τη συσκευασία. Οι χρήστες δεν εντόπισαν προβλήματα σχετικά με τη νέα συσκευασία του FemoSeal™ VCS. Από αυτήν τη μελέτη συγκεντρώθηκαν επίσης δεδομένα για τον χρόνο επίτευξης αιμόστασης.

Η μελέτη του 2022 αποσκοπούσε στην προληπτική συλλογή δεδομένων ασφάλειας και αποτελεσματικότητας του FemoSeal VCS στην επίτευξη αιμόστασης στο σημείο προσπέλασης της κοινής μηριαίας αρτηρίας (ΚΜΑ) σε πραγματικούς ασθενείς που υποβάλλονται σε διαδερμικές ενδοαγγειακές επεμβάσεις. Στη μελέτη συμπεριλήφθηκαν 230 ασθενείς. Τα πρωτεύοντα τελικά σημεία για το μητρώο είναι η επιτυχία της επέμβασης (δηλ. επιτυχής αιμόσταση στο σημείο διάτρησης) και η μείωση σοβαρών επιπλοκών (π.χ. αγγειακός τραυματισμός, αιμορραγία που σχετίζεται με το σημείο προσπέλασης, μόλυνση στο σημείο

προσπέλασης, επαναλαμβανόμενη χειροκίνητη συμπίεση και ομόπλευρη οξεία ισχαιμία άκρου που σχετίζεται με το νέο σημείο προσπέλασης). Η μελέτη κατέληξε στο συμπέρασμα ότι το FemoSeal™ VCS αποδίδει καλά σε πραγματικές συνθήκες και παρέχει αποτελεσματική αιμόσταση και χαμηλά ποσοστά επιπλοκών στο σημείο προσπέλασης για ασθενείς που υποβάλλονται σε περιφερικές ενδοαγγειακές επεμβάσεις. Καταδεικνύει καλές επιδόσεις με σύντομο χρόνο επίτευξης αιμόστασης και καλή ανατροφοδότηση σχετικά με τη χρηστικότητα από τον χειριστή, γεγονός που καθιστά το FemoSeal™ VCS ένα πολύτιμο ιατροτεχνολογικό προϊόν για τη σύγκλειση μηριαίας προσπέλασης.

Η Terumo Medical Corporation ολοκλήρωσε τρεις έρευνες υψηλής ποιότητας για ιατρικούς χρήστες κατά την τρέχουσα περίοδο αναφοράς (01 Σεπτεμβρίου 2019 - 31 Αυγούστου 2024).

Από τις κλινικές έρευνες για το FemoSeal™ συλλέχθηκαν προληπτικά κλινικά δεδομένα σε σχέση με την ασφάλεια και την απόδοση του FemoSeal™ VCS κατά τη διάρκεια της κλινικής χρήσης. Η έρευνα περιλάμβανε ερωτήσεις που εστίαζαν στο ιατροτεχνολογικό προϊόν συνολικά και στα σχετικά παρελκόμενα, συμπεριλαμβανομένου του οδηγού σύρματος 0,038", καθώς και στις άμεσες αλληλεπιδράσεις τους. Από τις κλινικές έρευνες για το οδηγό σύρμα συλλέχθηκαν προληπτικά κλινικά δεδομένα σε σχέση με την ασφάλεια και τις επιδόσεις κατά τη διάρκεια της κλινικής χρήσης του οδηγού σύρματος 0,038" που παρέχεται με το FemoSeal™ VCS. Οι ερωτήσεις της έρευνας επικεντρώθηκαν ειδικά στη γενική χρήση του οδηγού σύρματος, από την εισαγωγή του μέσω του επεμβατικού θηκαριού στο αγγειακό σύστημα έως και την αφαίρεσή του.

Το FemoSeal™ VCS και το οδηγό σύρμα 0,038" που περιλαμβάνεται στο ιατροτεχνολογικό προϊόν έλαβαν όλες τις αποδεκτές αξιολογήσεις και υποβλήθηκαν έξι (6) καταγγελίες για το ιατροτεχνολογικό προϊόν και εννέα (9) μη καταγγελίες για το οδηγό σύρμα με βάση την αξιολόγηση των σχολίων που ελήφθησαν από υψηλής ποιότητας κλινικές έρευνες. Οι καταγγελίες αξιολογήθηκαν τόσο για το FemoSeal όσο και για το οδηγό σύρμα και αξιολογήθηκαν ως μέρος της διαδικασίας παρακολούθησης μετά τη διάθεση στην αγορά της Terumo. Δεν εντοπίστηκαν νέοι κίνδυνοι ή/και επίπεδα κινδύνου.

Μια έρευνα σε ιατρούς χρήστες ολοκληρώθηκε το 2024 στο πλαίσιο δραστηριοτήτων PMCF. Τα αποτελέσματα της έρευνας κατέδειξαν ότι η βαθμολογία απόδοσης και η ασφάλεια του FemoSeal™ VCS ήταν συνολικά πολύ ευνοϊκές. Έχει επίσης καταδειχθεί η συμβατότητα άλλων οδηγών συρμάτων εκτός από το ένα πρότυπο που παρέχεται με το FemoSeal™ VCS.

#### **1.4.3.2 Συνεχής/ προγραμματισμένη κλινική παρακολούθηση μετά την κυκλοφορία του προϊόντος στην αγορά**

Η TMC πραγματοποιεί μία συνεχιζόμενη/ προγραμματισμένη κλινική δραστηριότητα παρακολούθησης μετά τη διάθεση στην αγορά. Θα πραγματοποιηθεί μια κλινική έρευνα για την προληπτική συλλογή σχολίων και παρατηρήσεων σε σχέση με τη χρήση του οδηγού σύρματος που συνοδεύει το FemoSeal VCS και διατίθεται στην ευρωπαϊκή αγορά. Η έρευνα θα ολοκληρωθεί από ιατρούς για να μελετηθεί ποια οδηγά σύρματα χρησιμοποιήθηκαν κατά την επέμβαση. Σκοπός αυτής της έρευνας είναι η αντιμετώπιση ενός κενού που εντοπίστηκε ως έλλειψη βιβλιογραφίας και σχολίων εξωτερικών αναθεωρητών σχετικά με τη συμβατότητα του FemoSeal™ VCS με τη χρήση άλλων οδηγών συρμάτων άλλων κατασκευαστών εκτός της Terumo. Στα σχόλια και τις παρατηρήσεις συμπεριλαμβάνονται τεχνικά αποτελέσματα, καθώς και η κλινική απόδοση και η ασφάλεια που αφορούν στην απόδοση του ιατροτεχνολογικού προϊόντος με διαφορετικά οδηγά σύρματα.

#### **1.4.4 Σύνοψη δεδομένων από συστηματική ανασκόπηση της βιβλιογραφίας**

Η Terumo Medical Corporation διενεργεί συστηματικά ανασκόπηση της βιβλιογραφίας, προκειμένου να συλλέξει και να αξιολογήσει δεδομένα κλινικής ασφάλειας και απόδοσης από δημοσιευμένες μελέτες για το FemoSeal™ VCS ή/και παρόμοια ιατροτεχνολογικά προϊόντα. Ο σκοπός του ετήσιου ελέγχου της δημοσιευμένης βιβλιογραφίας είναι ο εντοπισμός προηγούμενων άγνωστων ανεπιθύμητων ενεργειών, η παρακολούθηση γνωστών ανεπιθύμητων ενεργειών, ο εντοπισμός έκτακτων κινδύνων και ο εντοπισμός πιθανής συστηματικής κακής χρήσης ή χρήσης εκτός εγκεκριμένων ενδείξεων του FemoSeal™ VCS.

Κατά την πιο πρόσφατη συστηματική ανασκόπηση της βιβλιογραφίας, η οποία κάλυψε την περίοδο από την 1η Σεπτεμβρίου 2019 έως την 31η Αυγούστου 2024, εντοπίστηκαν 29 δημοσιευμένες μελέτες που παρείχαν δεδομένα κλινικής ασφάλειας και απόδοσης για το FemoSeal™ VCS. Είκοσι τρεις βιβλιογραφικές παραπομπές ανέφεραν χρήση του FemoSeal™

VCS εντός της επισήμανσης, ενώ χρήση εκτός επισήμανσης αναφέρθηκε σε εννέα μελέτες. Γενικά, από την ανασκόπηση της βιβλιογραφίας όσον αφορά σε μελέτες που εστιάζουν ειδικά στη χρήση του FemoSeal™ VCS προκύπτει ότι ο υπό μελέτη πληθυσμός είναι αντιπροσωπευτικός των ασθενών της ΕΕ που υποβάλλονται σε επεμβάσεις διαδερμικού αγγειακού καθετηριασμού. Βλ. **Ενότητα 3** για έναν κατάλογο αυτών των 23 δημοσιεύσεων εντός της επισήμανσης, με αξιολόγηση από ομοτίμους.

Οι κλινικές επιδόσεις αξιολογήθηκαν με βάση τις ακόλουθες μετρήσεις:

- Ο χρόνος επίτευξης αιμόστασης είναι καλύτερος ή συγκρίσιμος με τις τελευταίες εξελίξεις στην τεχνολογία για τη διαδερμική σύγκλειση της κοινής μηριαίας αρτηρίας.
- Ο χρόνος έως το περιπατητικό στάδιο είναι καλύτερος ή συγκρίσιμος με τις τελευταίες εξελίξεις στην τεχνολογία για τη διαδερμική σύγκλειση της κοινής μηριαίας αρτηρίας.
- Το ποσοστό των μετεγχειρητικών επιπλοκών είναι συγκρίσιμο ή χαμηλότερο από τα ισχύοντα πρότυπα περίθαλψης.

Με βάση αυτές τις μετρήσεις κλινικής απόδοσης, τα δεδομένα σε αυτήν την ανασκόπηση βιβλιογραφίας έδειξαν ότι το FemoSeal™ VCS μπορεί να χρησιμοποιηθεί με επιτυχία στη σύγκλειση της διάτρησης μηριαίας αρτηρίας (αρτηριοτομή) σε ασθενείς που έχουν υποβληθεί σε διαδερμικό καθετηριασμό με χρήση ενός επεμβατικού θηκαριού 7 Fr ή μικρότερου. Η πλήρης αιμόσταση επιτεύχθηκε στην πλειοψηφία των ασθενών (79,65-100%) και συσχετίστηκε με διάμεσο χρόνο έως την αιμόσταση το 0,5 λεπτό και μέσο χρόνο έως το εξιτήριο τις 3 ημέρες. Ποσοστό από 69,2 έως 86,7% των ασθενών κατέστησαν περιπατητικοί 5 ώρες μετά τη σύγκλειση, με μέσο παραμονή σε κλινήρη θέση μετεγχειρητικά τα 349 λεπτά. Η αστοχία του FemoSeal™ VCS παρατηρήθηκε σε ποσοστό 3,68-4% των περιστατικών και απαιτήθηκε πρόσθετη χειροκίνητη συμπίεση σε ποσοστό 0,9-4,4% των διαδικασιών.

Η κλινική ασφάλεια αξιολογήθηκε με βάση τα ανεπιθύμητα συμβάντα, συμπεριλαμβανομένων, μεταξύ άλλων, των εξής:

- Αιμορραγία
- Αιμάτωμα
- Ψευδοανεύρυσμα
- Μώλωπες
- Αρτηριοφλεβικό συρίγγιο
- Μόλυνση
- Θάνατος

Για καθένα από αυτά τα ανεπιθύμητα συμβάντα, το ποσοστό εμφάνισης που αναφέρθηκε για το FemoSeal™ VCS στις συμπεριλαμβανόμενες μελέτες ήταν μικρότερο ή συγκρίσιμο με τα ποσοστά που είχαν αναφερθεί στο παρελθόν για χειροκίνητη συμπίεση και άλλα ιατροτεχνολογικά προϊόντα σύγκλεισης αγγείων.

Η ανασκόπηση 10 αναφορών περιστατικών δεν κατέδειξε ανεπιθύμητα συμβάντα, καθώς δεν εντοπίστηκαν νέοι, μη αναμενόμενοι, αναδυόμενοι ή μη αποδεκτοί κίνδυνοι.

Η συνολική αποτελεσματικότητα της χρήσης του FemoSeal™ VCS κατά τη διάρκεια διαγνωστικής αγγειογραφίας ή παρεμβατικών επεμβάσεων εξαρτάται από πολλούς παράγοντες, όπως: φύλο, ηλικία, ανατομία ασθενούς, συννοσηρότητες, ανατομική τοποθέτηση του σημείου παρακέντησης, εμπειρία του χειρουργού, μέθοδος έκπτυξης του VCD, μετεγχειρητική φροντίδα κ.λπ. Εκτός από την τεχνική επιτυχία, συμπεριλαμβανομένης της επίτευξης αιμόστασης, το FemoSeal™ VCS προσέφερε κλινικά οφέλη σε σχέση με τη σύγκλειση αγγείων μετά από παρακέντηση της μηριαίας αρτηρίας, όπως μείωση του χρόνου έως την επίτευξη αιμόστασης, μείωση του χρόνου έως ότου οι ασθενείς καταστούν περιπατητικοί. Τα αποτελέσματα επιδόσεων για το FemoSeal™ VCS συνάδουν με τα αναμενόμενα για τον συγκεκριμένο τύπο ιατροτεχνολογικού προϊόντος όταν χρησιμοποιείται όπως προβλέπεται. Ορισμένες από τις αναφορές που ανακτήθηκαν κατά τη διάρκεια της τρέχουσας περιόδου αναζήτησης κατέδειξαν τη χρήση του εν λόγω τεχνολογικού προϊόντος σε ανατομική θέση διαφορετική από την κοινή μηριαία αρτηρία και για τη σύγκλειση αρτηριοτομών > 7 Fr, η οποία θεωρείται εκτός επισήμανσης.

Κατά την ανασκόπηση δεν εντοπίστηκαν άγνωστες ανεπιθύμητες ενέργειες, αναδυόμενοι κίνδυνοι ή πιθανή συστηματική εσφαλμένη χρήση του προϊόντος. Ωστόσο, εάν το FemoSeal™ VCS χρησιμοποιείται με προσοχή από εκπαιδευμένους ιατρούς, αποτελεί χρήσιμο και απαραίτητο ιατροτεχνολογικό προϊόν κλινικής χρήσης. Συνολικά, η στοχευόμενη θεραπεία και, κατά συνέπεια, το FemoSeal™ VCS ανταποκρίνεται στην κλινική ανάγκη που υπάρχει επί του παρόντος στη θεραπεία επιπλοκών που σχετίζονται με την αγγειακή προσπέλαση.

Συνολικά, από τα δεδομένα αυτής της βιβλιογραφικής ανασκόπησης δεν εντοπίστηκε κανένα ζήτημα απόδοσης ή ασφάλειας στο κλινικό περιβάλλον που ήταν άγνωστο στο παρελθόν ή ανεπιθύμητες επιπτώσεις που παρουσιάστηκαν σε υψηλότερα από τα αναμενόμενα/ αποδεκτά ποσοστά. Επομένως, μπορεί να συναφθεί από αυτήν την επισκόπηση βιβλιογραφίας ότι το FemoSeal™ VCS, όταν χρησιμοποιείται για την παροχή συμπίεσης για αιμόσταση στην αρτηριοτομή μετά τον διαδερμικό καθετηριασμό, συνεχίζει να αποδίδει όπως αναμένεται και δεν σχετίζεται με σοβαρά συμβάντα ασφαλείας.

#### **1.4.5 Σύνοψη δεδομένων από επιτήρηση μετά την κυκλοφορία του προϊόντος στην αγορά**

Υπάρχει ένα προληπτικό σύστημα παρακολούθησης (PMS) και η εξέταση όλων των καταγγελιών ολοκληρώνεται σε μηνιαία βάση και σε συμμόρφωση με τις εσωτερικές διαδικασίες κατασκευής. Τα δεδομένα καταγγελιών αναλύθηκαν κατά το χρονικό διάστημα από την 1η Σεπτεμβρίου 2019 έως την 31η Αυγούστου 2024. Συνολικά, υπήρξαν 28 Αναφορές

Επαγρύπνησης Ιατροτεχνολογικών Προϊόντων (MDV) και 476 αναφορές καταγγελιών πελατών που υποβλήθηκαν στον κατασκευαστή. Από τις 28 αναφορές MDV, 27 σχετίζονταν με ανεπιθύμητα συμβάντα και μία με δυσλειτουργία του τεχνολογικού προϊόντος. Υπήρξαν δύο θάνατοι κατά τη διάρκεια της περιόδου αναφοράς, αλλά κανένας από τους αναφερόμενους θανάτους δεν κρίθηκε ότι σχετίζεται με το εν λόγω ιατροτεχνολογικό προϊόν. Από τις 476 καταγγελίες που υποβλήθηκαν στον κατασκευαστή, οι πιο συχνές αιτίες καταγγελιών ήταν δυσκολίες στην έκπτυξη (146 συμβάντα, ποσοστό συμβάντων 0,0142%). Η κατάσταση αστοχίας συμβάντων απόσυρσης είναι η δεύτερη πιο συχνή με ποσοστό 0,0126% (130 συμβάντα).

Το σύστημα σύγκλεισης αγγείων FemoSeal™ έχει περισσότερες από 1.030.136 πωλήσεις παγκοσμίως και 827.843 στον Ευρωπαϊκό Οικονομικό Χώρο. Η υπολογισμένη συχνότητα καταγγελιών βάσει των παγκόσμιων πωλήσεων ανέρχεται στο 0,046%. Το συνολικό ποσοστό καταγγελιών από πελάτες είναι πολύ χαμηλό. Δεν εντοπίστηκαν νέοι κίνδυνοι που δεν περιλαμβάνονται στις οδηγίες χρήσης και στην τεκμηρίωση κινδύνου.

Τα ποσοστά εμφάνισης των ανεπιθύμητων ενεργειών παρουσιάζονται στον **Πίνακα 1.2**. Δεν εντοπίστηκαν νέοι μη αναμενόμενοι, αναδυόμενοι ή μη αποδεκτοί κίνδυνοι μέσω των καταγγελιών. Δεν υπήρξαν σημαντικές αυξήσεις στη συχνότητα ή τη βαρύτητα των γνωστών ανεπιθύμητων ενεργειών.

#### 1.4.6 Γενική σύνοψη της κλινικής απόδοσης και ασφάλειας

Το FemoSeal™ VCS ενδείκνυται για χρήση στη σύγκλειση της διάτρησης της κοινής μηριαίας αρτηρίας (αρτηριοτομή) σε ασθενείς που έχουν υποβληθεί σε διαδερμικό καθετηριασμό με χρήση επεμβατικού θηκαριού 7F (2,33 mm) ή μικρότερου. Αυτή η κλινική αξιολόγηση βασίζεται σε μια ολοκληρωμένη ανάλυση των διαθέσιμων κλινικών δεδομένων και της βιβλιογραφίας πριν και μετά την κυκλοφορία του προϊόντος στην αγορά που σχετίζονται με την προοριζόμενη χρήση του FemoSeal™ VCS.

Διενεργήθηκε μια ολοκληρωμένη ανασκόπηση της δημοσιευμένης βιβλιογραφίας που καλύπτει το χρονικό διάστημα από την 1η Σεπτεμβρίου 2019 έως την 31η Αυγούστου 2024. Το σύνολο των στοιχείων περιελάμβανε 29 μελέτες για το FemoSeal™ VCS. Από τα στοιχεία που παρέχονται στην κλινική αξιολόγηση εξάγεται το συμπέρασμα ότι, όταν χρησιμοποιείται όπως ενδείκνυται, το εξεταζόμενο ιατροτεχνολογικό προϊόν είναι ασφαλές και αποτελεσματικό και ότι τυχόν κίνδυνοι ή ανεπιθύμητες παρενέργειες, οι οποίες ενδέχεται να σχετίζονται με το ιατροτεχνολογικό προϊόν υπό κανονικές συνθήκες χρήσης, αποτελούν αποδεκτούς κινδύνους σε σύγκριση με τα οφέλη για τον ασθενή. Τα αποτελέσματα απόδοσης για τα εξεταζόμενα ιατροτεχνολογικά προϊόντα συνάδουν με τα αναμενόμενα για τον συγκεκριμένο τύπο ιατροτεχνολογικού προϊόντος όταν χρησιμοποιείται όπως προβλέπεται.

Τα δυνητικά ανεπιθύμητα συμβάντα που σχετίζονται με τη χρήση του FemoSeal™ VCS περιλαμβάνουν τα ανεπιθύμητα συμβάντα που αναφέρονται συνήθως με εναλλακτικά μέσα

σύγκλεισης αρτηριοτομής, π.χ. αιμορραγία και αιμάτωμα. Συνολικά, τα ποσοστά εμφάνισης για τα ανεπιθύμητα συμβάντα που αναφέρθηκαν με τη χρήση του FemoSeal™ VCS είναι παρόμοια με τα ποσοστά που αναφέρονται με χειροκίνητη συμπίεση και παρόμοια ιατροτεχνολογικά προϊόντα σύγκλεισης αγγείων. Συγκεκριμένα, για αιμορραγία και αιμάτωμα, τα αναφερόμενα ποσοστά για το FemoSeal™ VCS είναι μικρότερα από τα αναφερόμενα ποσοστά για παρόμοια ιατροτεχνολογικά προϊόντα σύγκλεισης αγγείων. Καθένα από τα αναφερόμενα ανεπιθύμητα συμβάντα, από τη δημοσιευμένη βιβλιογραφία και την παρακολούθηση μετά την κυκλοφορία του προϊόντος στην αγορά, είχαν εντοπιστεί στο παρελθόν (βλ. **Ενότητα 1.3**).

Τα υφιστάμενα δεδομένα σχετικά με την κλινική ασφάλεια και τις επιδόσεις του FemoSeal VCS υποδεικνύουν ότι τα οφέλη για τον ασθενή από τη χρήση αυτού του ιατροτεχνολογικού προϊόντος σύγκλεισης αγγείων υπερτερούν των πιθανών κινδύνων, κατά τη χρήση σύμφωνα με τις Οδηγίες χρήσης.

Όπως υποδεικνύεται στις προηγούμενες ενότητες ανωτέρω, τα δεδομένα που παρέχονται για το FemoSeal™ VCS καταδεικνύουν τη συνοχή μεταξύ των δεδομένων που σχετίζονται με το ιατροτεχνολογικό προϊόν που βρίσκεται υπό αξιολόγηση (π.χ. χρήση του ιατροτεχνολογικού προϊόντος, αποτελέσματα ασφάλειας, κλινικές επιδόσεις και κλινικά οφέλη), τις αναγνωρισμένες ισοδύναμα ιατροτεχνολογικά προϊόντα και των δεδομένων που σχετίζονται με παρόμοια ιατροτεχνολογικά προϊόντα που αναφέρονται στην τρέχουσα εξέλιξη της τεχνολογίας.

Η ανάλυση διασταύρωσης δεδομένων ασφάλειας δεν εντόπισε κενά μεταξύ των ακολούθων:

- Δεδομένων που αναφέρονται στις τελευταίες εξελίξεις στην τεχνολογία
- Δεδομένων ειδικών για το ιατροτεχνολογικό προϊόν υπό αξιολόγηση
- Δεδομένων που αναφέρονται στο(στα) αρχείο(-α) διαχείρισης κινδύνου
- Δεδομένων που αναφέρονται στην επισήμανση ή/και στις οδηγίες χρήσης (δηλ. αναφέρονται οι υπολειπόμενοι κίνδυνοι που πρέπει να γνωστοποιούνται στον χρήστη).

Η κλινική ασφάλεια έχει αποδειχθεί από τα χαμηλά ποσοστά επιπλοκών που εντοπίζονται στην δημοσιευμένη, αξιολογημένη από ομότιμους κλινική βιβλιογραφία, τις κλινικές μελέτες που χρηματοδοτούνται από την εταιρεία, την ανασκόπηση των δεδομένων μετά την κυκλοφορία του προϊόντος στην αγορά σε συνδυασμό με την απουσία αποσύρσεων από την αγορά. Δεν εντοπίστηκαν προβληματισμοί σχετικά με τις επιδόσεις. Στη βιβλιογραφία που ανασκοπήθηκε περιλαμβανόταν η χρήση του FemoSeal™ VCS η οποία ήταν σύμφωνη με την προβλεπόμενη χρήση του κατασκευαστή.

### 1.5 Πιθανές διαγνωστικές ή θεραπευτικές εναλλακτικές

Η χειροκίνητη συμπίεση χρησιμοποιείται παραδοσιακά για την επίτευξη αιμόστασης στο σημείο της αρτηριοτομής μετά από αγγειακούς καθετηριασμούς. Η χειροκίνητη συμπίεση έχει συσχετιστεί με ακινητοποίηση του ασθενούς για μεγάλα χρονικά διαστήματα (έως και 8 ώρες μετά από μια επέμβαση) και με σημαντική δυσφορία και παρατεταμένη νοσηλεία. Μια πρόσφατη συστηματική ανασκόπηση έδειξε ότι ο διάμεσος χρόνος για την επίτευξη αιμόστασης με χειροκίνητη συμπίεση ήταν 20,8 λεπτά.<sup>1</sup>

Στις εναλλακτικές λύσεις για τη χειροκίνητη συμπίεση συμπεριλαμβάνεται η χρήση εξωτερικών αιμοστατικών ιατροτεχνολογικών προϊόντων που εφαρμόζουν μηχανική συμπίεση στο σημείο της αρτηριοτομής. Τα προϊόντα αυτά δεν μειώνουν τον χρόνο επίτευξης αιμόστασης ή τον χρόνο έως το περιπατητικό στάδιο, αλλά μειώνουν τις απαιτήσεις σε προσωπικό, αντικαθιστώντας τη χειροκίνητη συμπίεση με μηχανική συμπίεση. Τα ποσοστά ανεπιθύμητων συμβάντων που σχετίζονται με τη χρήση μηχανικής συμπίεσης είναι παρόμοια με αυτά της χειροκίνητης συμπίεσης.

Τα ιατροτεχνολογικά προϊόντα σύγκλεισης αγγείων, όπως το FemoSeal™ VCS, έχουν σχεδιαστεί για σύγκλειση της αρτηριοτομής. Στόχος τους είναι να μειώσουν τον χρόνο επίτευξης αιμόστασης και να επιτρέψουν την ταχύτερη μετάβαση στο περιπατητικό στάδιο. Μια πρόσφατη συστηματική ανασκόπηση σε 13 ιατροτεχνολογικά προϊόντα που διατίθενται στο εμπόριο διαπίστωσε ότι ο διάμεσος χρόνος για την επίτευξη αιμόστασης με ιατροτεχνολογικό προϊόν σύγκλεισης αγγείων ήταν 5,4 λεπτά. Ο διάμεσος χρόνος αιμόστασης για τα μεμονωμένα ιατροτεχνολογικά προϊόντα σύγκλεισης αγγείων κυμαινόταν από 1 λεπτό (FemoSeal™ VCS) έως 14 λεπτά, με την πλειονότητα των προϊόντων να κυμαίνεται μεταξύ 4 και 10 λεπτών.<sup>1</sup>

Τα συχνά αναφερόμενα ανεπιθύμητα συμβάντα που σχετίζονται με τη σύγκλειση του σημείου της αρτηριοτομής, με χειροκίνητες συμπίεσεις, εξωτερικά αιμοστατικά ιατροτεχνολογικά προϊόντα ή ιατροτεχνολογικά προϊόντα σύγκλεισης αγγείων περιλαμβάνουν αιμάτωμα, αιμορραγία στο σημείο πρόσβασης, ψευδοανεύρυσμα, αρτηριοφλεβικό συρίγγιο και μόλυνση. Η ίδια συστηματική ανασκόπηση (34 τυχαιοποιημένες ελεγχόμενες δοκιμές, 14.401 ασθενείς) διαπίστωσε ότι τα ποσοστά ανεπιθύμητων συμβάντων ήταν παρόμοια μεταξύ της χειροκίνητης συμπίεσης και της χρήσης ιατροτεχνολογικών προϊόντων σύγκλεισης αγγείων, με την εξαίρεση ότι η αιμορραγία έτεινε να είναι λίγο υψηλότερη με ιατροτεχνολογικά προϊόντα σύγκλεισης αγγείων.<sup>1</sup>

### 1.6 Προτεινόμενο προφίλ χρηστών και εκπαίδευση

Οι προβλεπόμενοι χρήστες του FemoSeal™ Vascular Closure System είναι ιατροί με εκπαίδευση που τους επιτρέπει τη διεξαγωγή αρτηριακής πρόσβασης και σύγκλεισης για ενδοαγγειακές επεμβάσεις μέσω της κοινής μηριαίας αρτηρίας και έχουν συμμετάσχει σε ένα πρόγραμμα εκπαίδευσης ιατρών της Terumo Medical Corporation FemoSeal™.

### 1.7 Σχετικά εναρμονισμένα και κοινά πρότυπα

| Κωδικός προτύπου | Τρέχον έτος συμμόρφωσης/Αναθ. | Περιγραφή                                                                                                                                |

Ovaj sažetak o sigurnosnoj i kliničkoj učinkovitosti (SSCP) pruža javni pristup ažuriranom sažetku glavnih aspekata sigurnosti i kliničke učinkovitosti sustava FemoSeal™ Vascular Closure System (VCS).

Sažetak o sigurnosnoj i kliničkoj učinkovitosti proizvoda namijenjen korisnicima / zdravstvenim djelatnicima naveden je u nastavku, u **dijelu 1.0**.

## **1.0 SAŽETAK ZA KORISNIKE / ZDRAVSTVENE DJELATNIKE**

Sažetak o sigurnosnoj i kliničkoj učinkovitosti nije namijenjen kao zamjena za Upute za uporabu kao glavni dokument da bi se osigurala sigurna uporaba proizvoda niti je namijenjen za pružanje dijagnostičkih ili terapijskih prijedloga predviđenim korisnicima ili pacijentima. Sažetak o sigurnosnoj i kliničkoj učinkovitosti nije namijenjen kao zamjena za obavezne podatke na karticama implantata ili u drugim obaveznim dokumentima.

### **1.1 Namjena proizvoda**

#### **1.1.1 Namjena**

Sustav FemoSeal™ Vascular Closure System medicinski je proizvod namijenjen za zatvaranje arterijske punkcije nakon perkutane kateterizacije kroz zajedničku femoralnu arteriju.

#### **1.1.2 Indikacije za uporabu**

Sustav FemoSeal™ Vascular Closure System indiciran je za uporabu kod zatvaranja punkcije (arteriotomije) zajedničke femoralne arterije u pacijenata kod kojih je provedena perkutana kateterizacija s pomoću uvedne ovojnice debljine 7 F (2,33 mm) ili manje.

#### **1.1.3 Kontraindikacije i/ili ograničenja**

Sustav FemoSeal™ Vascular Closure System kontraindiciran je u pacijenata s arteriotomijama kod kojih su upotrijebljene uvedne ovojnice ili proizvodi veći od 7 F (2,33 mm).

#### **1.1.4 Ciljne populacije**

Sigurnost i djelotvornost sustava FemoSeal™ Vascular Closure System utvrđena je u pacijenata u dobi od 18 godina i starijih koji su bili podvrgnuti perkutanoj kateterizaciji uporabom uvedne ovojnice veličine 7 F (2,33 mm) ili manje.

#### **1.1.5 Posebne populacije pacijenata**

Sigurnost i učinkovitost sustava FemoSeal™ Vascular Closure System nije utvrđena u sljedećim populacijama pacijenata:

- pacijenti s već postojećom autoimunom bolesti
- pacijenti koji se podvrgavaju terapijskoj trombolizi
- pacijenti s klinički značajnim bolestima perifernih krvnih žila
- pacijenti s nekontroliranom hipertenzijom (> 220 mmHg sistolički ili > 110 mmHg dijastolički)

- pacijenti s poremećajima krvarenja, uključujući trombocitopeniju (broj trombocita < 100.000), ili anemijom (Hgb < 10 mg/dl)
- pacijenti s unutarnjim lumenom zajedničke femoralne arterije manjim od 5 mm
- pacijenti s oštećenjem bubrega i/ili jetre
- pacijenti s drugim relevantnim komorbiditetima
- populacija sa specifičnim rasnim i/ili etničkim podrijetlom
- pacijenti s infarktom miokarda unutar 72 sata
- pacijenti s vaskularnim presadkom ili stentom na mjestu punkcije
- trudnice i dojilje
- pacijenti mlađi od 18 godina.

#### 1.1.6 Predviđeni korisnici

Predviđeni su korisnici sustava FemoSeal™ Vascular Closure System liječnici koji su završenom obukom kvalificirani za obavljanje arterijskog pristupa i zatvaranja u okviru endovaskularnih zahvata kroz zajedničku femoralnu arteriju te koji su sudjelovali u programu obuke za liječnike za FemoSeal™ društva Terumo Medical Corporation.

## 1.2 Opis proizvoda

### 1.2.1 Opis proizvoda

Sustav FemoSeal™ Vascular Closure System, koji proizvodi društvo Terumo Medical Corporation (TMC), resorptivni je proizvod za zatvaranje krvnih žila namijenjen za postizanje hemostaze femoralne arterije nakon perkutane kateterizacije kroz zajedničku femoralnu arteriju.

Elementi za zatvaranje sustava FemoSeal™ sastoje se od dvaju resorptivnih polimernih diskova, unutarnje brtve i vanjskog diska za zaključavanje koji su međusobno povezani resorbirajućim multifilamentom, čime se mehanički zatvara arteriotomija (pogledajte **sliku 1.1** i **sliku 1.2**).

Nakon postavljanja kroz ovojnicu konusnog kućišta, vanjski disk za zaključavanje nabija se na multifilamentnu osovinu, što dovodi do mehaničkog zatvaranja mjesta punkcije između unutarnjeg i vanjskog diska za zaključavanje. Unutarnja brtva i vanjski disk za zaključavanje drže se na mjestu trenjem na multifilamentnoj osovinu. Hemostaza se postiže mehaničkim sredstvima. Elementi za zatvaranje razgrađuju se hidrolizom.

Komponente za zatvaranje koje se implantiraju, unutarnja brtva i vanjski disk za zaključavanje razgrađuju se tijekom osamnaest (18) mjeseci, dok se procjenjuje da se multifilament razgrađuje

i resorbira hidrolizom u okolna tkiva nakon od dvije (2) do tri (3) godine. Mogućnost implantiranih komponenti za zatvaranje za održavanje kompresije na arteriotomiji ispitana je do osam (8) sati. Proizvodi razgrađivanja metaboliziraju se i izlučuju urinom ili se preko pluća izdišu kao ugljikov dioksid. Nisu zapaženi učinci nakupljanja u ispitivanjima na životinjama. Dodatne komponente sustava FemoSeal™ koje će doći u dodir sa živim tkivom ili krvlju tijekom zahvata su ovojnica konusnog kućišta, dilatator, cijev za nabijanje, potiskivač i žica vodicica.

**Slika 1.1 Unutarnja brtva i vanjski disk za zaključavanje**

**Slika 1.2 Postavljena unutarnja brtva i vanjski disk za zaključavanje**

Jedinica FemoSeal™ pakirana je zajedno s dilatatorom i žicom vodicicom vanjskog promjera 0,038" (0,97 mm), duljine 27,5" (70 cm) i elementom za izravnavanje oblika slova J, pogledajte **sliku 1.3** u nastavku. Žica vodicica nalazi se unutar polietilenske cijevi. Svi su dijelovi zapakirani u fiksnu papirnatu pliticu. Pakiranje uključuje i karticu implantata za pacijenta. Sustav FemoSeal™ Vascular Closure System ne zahtijeva dodatni pribor da bi proizvod funkcionirao kako je predviđeno, a proizvod je namijenjen samo za uporabu s dilatatorom i žicom vodicicom koji se nalaze u pakiranju proizvoda.

\* Ugradivi dio proizvoda; komponente za ugradnju sigurne su za MR

Sustav FemoSeal™ VCS steriliziran je etilen-oksidom (EO) i medicinski je proizvod za jednokratnu uporabu. Sustav FemoSeal™ VCS konstruiran je tako da se ne može ponovno upotrijebiti.

### **Način funkcioniranja**

Sustav FemoSeal™ VCS potiče mehaničku hemostazu postavljanjem ugradivih elemenata za zatvaranje unutar i izvan zajedničke femoralne arterije. Mehanizam kojim se sprječava krvarenje omogućuju unutarnja brtva koja zatvara mjesto punkcije i vanjski disk za zaključavanje koji drži unutarnju brtvu na mjestu.

### 1.2.3 Klinička korist

Sustav FemoSeal™ VCS pruža sljedeće kliničke koristi u odnosu na zatvaranje krvnih žila nakon punkcije zajedničke femoralne arterije:

- Smanjenje vremena za postizanje hemostaze<sup>1</sup>
- Smanjenje vremena za postizanje pokretljivosti<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015.). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### 1.2.4 Prethodne generacije ili varijante

- Prva verzija sustava FemoSeal™ VCS (#11200) prodavala se na europskom tržištu tijekom 2005. godine i dijela 2006.
- Trenutačni sustav FemoSeal™ VCS (#11202), s poboljšanim sustavom uvođenja, nalazi se na tržištu od 28. ožujka 2006.

### 1.2.5 Pribor namijenjen za upotrebu u kombinaciji s proizvodom

Jedinica FemoSeal™ pakirana je zajedno s dilatatorom, žicom vodilicom vanjskog promjera 0,038" (0,97 mm) i duljine 27,5" (70 cm) te elementom za izravnavanje oblika slova J. Žica vodilica dodatna je oprema za jedinicu FemoSeal™. Element za izravnavanje oblika slova J sastavni je dio žice vodilice, dok je dilatator sastavni dio jedinice FemoSeal™. Žica vodilica je jedini dodatni pribor. Žica vodilica nalazi se unutar polietilenske cijevi. Svi su dijelovi zapakirani u fiksnu papirnatu pliticu. Pakiranje uključuje i karticu implantata za pacijenta. Sustav FemoSeal™ Vascular Closure System ne zahtijeva dodatni pribor da bi proizvod funkcionirao kako je predviđeno, a proizvod je namijenjen samo za uporabu s dilatatorom i žicom vodilicom koji se nalaze u pakiranju proizvoda.

### 1.2.6 Ostali uređaji i proizvodi namijenjeni za upotrebu u kombinaciji s proizvodom

Sustav FemoSeal™ VCS ne zahtijeva dodatne proizvode kako bi funkcionirao kako je predviđeno.

## 1.3 Rizici i upozorenja

### 1.3.1 Preostali rizici i neželjeni učinci

U **tablici 1.2** navedeni su poznati ili predvidljivi štetni događaji, negativne posljedice i komplikacije povezane s uporabom proizvoda FemoSeal™ VCS kao rezultat preostalih rizika. Stopa učestalosti temelji se na analizi dokumentacije o riziku i izračunava se na temelju podataka postmarketinškog nadzora od 1. rujna 2019. do 31. kolovoza 2024. Nema nepoznatih preostalih

rizika za FemoSeal™ VCS i svi su primjenjivi rizici obrađeni u Uputama za uporabu i postupku upravljanja rizicima.

### 1.3.2 Upozorenja i mjere opreza

#### Upozorenja

1. Nemojte upotrebljavati ako je pakiranje oštećeno ili ako je bilo koja sterilna barijera oštećena.
2. Nemojte upotrebljavati nakon isteka roka valjanosti jer bi biorazgradive komponente mogle biti neadekvatne za rad.
3. Nemojte upotrebljavati ako bilo koji predmet izgleda oštećen ili neispravan.
4. Uporaba sustava FemoSeal™ Vascular Closure System kod kojeg je možda došlo do bakterijske kontaminacije uvedne ovojnice ili okolnog tkiva može uzrokovati infekciju.
5. Ako postoji sumnja da je stražnja stijenka arterije probušena ili je izvršeno više od jedne arterijske punkcije, nemojte se oslanjati isključivo na sustav FemoSeal™ Vascular Closure System za postizanje arterijske hemostaze. Upotrijebite dodatnu ručnu ili mehaničku kompresiju.
6. Ako je mjesto uboda na ili distalno od bifurkacije femoralne arterije, sustav FemoSeal™ Vascular Closure System ne smije se upotrebljavati zbog rizika od pogrešnog postavljanja unutarnje brtve. Ovaj događaj može dovesti do komplikacija krvarenja i/ili poremećaja uobičajenog protoka krvi.
7. Ako na mjestu reza dolazi do stalnog arterijskog krvarenja, nemojte rezati multifilament sve dok se ne postigne hemostaza. Ako se ne postigne hemostaza, učvrstite multifilament sterilnim povojem za rane i primijenite dodatnu kompresiju dok se ne postigne hemostaza. U slučaju dugotrajnog arterijskog krvarenja može doći do znatnih komplikacija koje mogu rezultirati ozljedom ili smrću pacijenta.
8. Sustav FemoSeal™ Vascular Closure System nemojte upotrebljavati ako je mjesto uboda proksimalno u odnosu na ingvinalni ligament jer to može dovesti do retroperitonealnog hematoma.
9. Pacijenti s povećanim rizikom od krvarenja mogu pretrpjeti povećani gubitak krvi, zbog čega je potrebna transfuzija.
10. Ako se unutarnji disk odvoji, to potencijalno može uzrokovati trombozu i/ili emboliju.

#### Mjere opreza

1. Postupak ugradnje sustava FemoSeal™ Vascular Closure System moraju obaviti liječnici s odgovarajućom obukom za uporabu ovog proizvoda.
2. Snimite ograničeni femoralni angiogram ili ultrazvučno navođenu femoralnu punkciju prije postavljanja sustava FemoSeal™ Vascular Closure System.

3. Prekinite postupak ako:
  - promjer lumena zajedničke femoralne arterije je  $< 5$  mm
  - u blizini mjesta punkcije na zajedničkoj femoralnoj arteriji prisutna je stenoza i/ili znatna količina plaka
  - arterijska punkcija je na mjestu bifurkacije femoralne arterije ili distalno od nje
  - u blizini mjesta punkcije zajedničke femoralne arterije nalaze se anomalije grana ili krvnih žila.
4. Ako je prisutan hematoma, potrebno je posebno paziti da se ovojnica konusnog kućišta ispravno uvede u arteriju.
5. Koristite tehniku punkcije jedne stijenke. Nemojte probijati stražnju stijenku arterije.
6. Uvijek se pridržavajte sterilne tehnike prilikom uporabe sustava FemoSeal™ Vascular Closure System.
7. Sustav FemoSeal™ Vascular Closure System namijenjen je samo za jednokratnu uporabu i ne smije se ni na koji način ponovno sterilizirati ni upotrebljavati. Jedinica FemoSeal™ osmišljena je tako da se ne može ponovno upotrijebiti.
8. Ako tijekom postavljanja unutarnje brtve osjetite neočekivani otpor, prekinite postupak.
9. Za ispravno postavljanje unutarnje brtve ponovno postavite palac tako da se gumb može slobodno vratiti natrag.
10. Prije postavljanja vanjskog blokirajućeg diska provjerite je li vrh konusnog kućišta FemoSeal™ jedinice ispod površine kože. Vanjski disk za zaključavanje može se nenamjerno postaviti iznad razine kože u pacijenata kod koji je razdaljina između femoralne arterije i razine kože kratka.
11. Za ispravno postavljanje može biti potrebna incizija kože prije postavljanja.
12. Ako je unutarnja brtva unutar arterije, ali nije moguće potpuno pritisnuti gumb i postaviti vanjski disk za zaključavanje, može biti potreban kirurški zahvat za uklanjanje elemenata za zatvaranje FemoSeal™.
13. Ako je u roku od 18 mjeseci potrebno ponoviti punkciju iste femoralne arterije, ponovnu punkciju treba napraviti najmanje jedan centimetar proksimalno od prethodnog mjesta pristupa sa sustavom FemoSeal™ Vascular Closure System.
14. Uputite pacijenta da se pridržava liječnikovih uputa u vezi s pregledom mjesta zatvaranja.
15. Uputite pacijenta da sa sobom sljedećih 18 mjeseci nosi karticu s informacijama za pacijenta

### **Mjere opreza prilikom otpuštanja**

Prije razmatranja otpuštanja iz bolnice procijenite pacijentovo stanje u pogledu sljedećih kliničkih stanja:

1. krvarenje i/ili hematoma na mjestu zatvaranja
2. Bol prilikom hodanja.
3. Znakovi infekcije na mjestu zatvaranja.

### **1.3.3 Sigurnosne korektivne radnje**

U razdoblju od 1. rujna 2019. do 31. kolovoza 2024. poduzeta je jedna korektivna radnja na terenu vezana uz FemoSeal™ VCS.

Godine 2022. Terumo je dobrovoljno opozvao FemoSeal™ VCS zbog pritužbi u kojima su se navodili neuspjesi u procesu i testiranju puštanja serije Elktonovog proizvoda FemoSeal za mjerenje sile nabijanja i sile retrakcije. Iz Južne Koreje povučeno je ukupno 950 jedinica.

## **1.4 Klinička procjena i praćenje nakon stavljanja u promet**

**Tablica 1.3** obuhvaća popis ključnih ispitivanja uključenih za stavljanje sustava FemoSeal™ VCS u promet kao i ispitivanja nakon stavljanja u promet te aktivnosti praćenja nakon stavljanja u promet. Verzija proizvoda korištena u ispitivanju navedena je u tablici u nastavku. Prva verzija sustava FemoSeal™ VCS (#11200) bila je u prometu do 2006., dok je sljedeća verzija (#C11202) puštena u promet 2006. godine te je ono što se danas nalazi u prometu.

**Tablica 1.3 Sažetak ključnih ispitivanja**

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002.<br><br>Radi Medical System AB<br><br>Izvršilo društvo Biomatech iz Francuske | Ispitivanje na životinjama | Svrha je ispitivanja bila procijeniti biokompatibilnost i biofunktionalnost biorazgradivog implantata osmišljenog za ° postizanje hemostaze u vaskularnom sustavu. Ispitani proizvod namijenjen je za ulazak u punkcijski otvor u arterijama radi postizanja hemostaze. Jedan disk ušao je u punkcijski otvor u arteriji, a drugi je zategnuo unutarnji disk izvan arterije. Oba diska umetnuta su kroz ovojnicu uvednice. Diskovi su osmišljeni za sprječavanje krvarenja, °zacjeljivanje u stijenku krvne žile te konačno razgradnju i apsorpciju. Ispitivanje je osmišljeno za prikupljanje i analizu podataka nakon funkcijske implantacije u ovaca | Razdoblje implantacije/praćenja je do 5 tjedana za sve životinje<br><br>4 ovce, 1 svinja<br><br>14 elemenata za zatvaranje<br><br>8 elemenata za zatvaranje ugrađenih u 2 ovce<br><br>2 elementa za zatvaranje ugrađena u 1 svinju<br><br>Kada su dva elementa za zatvaranje implantirana u istu femoralnu arteriju, implantirani su na udaljenosti > 30 mm | Svi kriteriji neželjenih znakova (upala, nekroza, krvarenje ili sve druge lezije) i svako stvaranje tankog pseudointimalnog sloja zabilježeni su. Posebna je pozornost posvećena početnoj tkivnoj integraciji proizvoda, s posebnim naglaskom na inkapsulaciju unutarnjeg diska.<br><br>Makroskopski, tamo gdje je promatrano, nisu uočeni nikakvi znakovi lokalne netolerancije ni stvaranja tromba. Makroskopskim promatranjem nisu utvrđene nikakve razlike između ovce i svinje nakon ugradnje elemenata za zatvaranje u femoralnim arterijama. Makroskopski, tamo gdje je promatrano, nisu uočeni nikakvi |

|  |  |  | <p>i svinja kako bi se ocijenio kapacitet implantata za održavanje fiziološke funkcije kada se upotrebljava u krvožilnom sustavu, u svrhu određivanja odgovora domaćina i odgovora proizvoda (fizička cjelovitost, tkivna enkapsulacija prilikom žrtvovanja) te kako bi se procijenila razgradnja implantata</p> |  | <p>znakovi lokalne netolerancije ni stvaranja tromba. Makroskopskim promatranjem nisu utvrđene nikakve razlike između ovce i svinje nakon ugradnje elemenata za zatvaranje u femoralnim arterijama.</p> <p>Histološkom analizom mjesta implantacije u ovaca nisu utvrđene nikakve lokalne nuspojave. Na unutarnjim i vanjskim diskovima utvrđeni su znakovi razgradnje i u nekim su slučajevima bili puknuli na manje dijelove. Unutarnji diskovi bili su potpuno integrirani u neointimalno tkivo. Histopatološka analiza u svinje pokazala je nešto više upalnih znakova oko unutarnjih i vanjskih diskova. Kod obje je životinje kod multifilamenta utvrđeno nešto više upalnih znakova nego kod materijala diska, što je normalno kod pletenoga kirurškog konca zbog većih površina.</p> <p>Prohodnost krvnih žila izmjerena je nakon 5 tjedana primjenom triju različitih metoda – histomorfometrijske, histomorfometrijske u kombinaciji s mjerenjem promjera žile s pomoću pomičnog mjerila i uporabom color dopplerskog ultrazvuka. Srednja prohodnost krvnih žila u ovce bila je između 60 i 80 %, ovisno o metodi</p> |

Kao dio plana predtržišnog razvoja proizvoda FemoSeal™ VCS, provedena su 3 funkcionalna ispitivanja na životinjama. Godine 2000., prije početka kliničkih ispitivanja, provedeno je ispitivanje na životinjama za procjenu biofunkcionalnosti sustava FemoSeal™ VCS. Ovim je ispitivanjem procijenjena sposobnost elemenata za zatvaranje za održavanje fiziološke funkcije te je procijenjeno i njihovo razgrađivanje. Nakon 18 mjeseci, materijal unutarnjeg i vanjskog diska više nije bio vidljiv, zamijenjen je endoluminalnim fibroznim tkivom. Zaključno je potvrđen kapacitet elementa za zatvaranje sustava FemoSeal™ VCS za održavanje fiziološke funkcije kada se upotrebljava u cirkulacijskom sustavu.

Godine 2002. provedeno je ispitivanje na životinjama kako bi se ocijenila biokompatibilnost i biofunkcionalnost biorazgradivog implantata sustava FemoSea™ VCS, osmišljenog za postizanje hemostaze u vaskularnom sustavu. Ukratko, razgradnja implantata gotovo je dovršena za 36 tjedana i nije bilo nikakvih znatnih neželjenih tkivnih reakcija.

Još jednim ispitivanjem na životinjama 2002. godine procijenjene su biokompatibilnost i biofunkcionalnost biorazgradivog implantata sustava FemoSeal™ VCS, osmišljenog za postizanje hemostaze u vaskularnom sustavu. Nakon 5 tjedana, inkapsulacija diska bila je dovršena i bili su vidljivi znakovi razgradnje na unutarnjim i vanjskim diskovima. Zaključno, potvrđena je sposobnost implantata za održavanje fiziološke funkcije kada se upotrebljava u krvožilnom sustavu.

U sklopu plana kliničkog razvoja sustava FemoSeal™ VCS, društvo Radi Medical System AB provelo je kliničko ispitivanje prije stavljanja u promet. To kliničko ispitivanje nije objavljeno ni dostupno na internetu. Ispitivanje s modelom proizvoda br. 11200 provedeno je 2002. – 2004. U skladu s europskom normom EN 540 (Kliničko ispitivanje medicinskih proizvoda za ljude)

i u skladu s općim smjernicama ICH-a za klinička ispitivanja i smjernicama za dobru kliničku praksu. Pojediniosti o ovom ispitivanju dokumentirane su u izvještaju EU-SE-001. To kliničko ispitivanje dokumentirano je u završnom izvještaju društva Radi Medical Systems AB, „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures”. Kliničko ispitivanje provedeno je s prvim modelom sustava FemoSeal™ br. 11200 te je bilo usredotočeno na sigurnost i učinkovitost ugrađivih komponenti za zatvaranje. Jedina razlika između prvog modela br. 11200 i aktualnog modela C11202 je veličina u frenchima, 6 F i 7 F, te poboljšani sustav uvođenja. Kliničke koristi, namjena, načela rada i sirovine ugrađivih elemenata za zatvaranje, unutarnja brtva i vanjski disk za zaključavanje ostaju nepromijenjeni.

Proizvod je bio namijenjen za pacijente podvrgnute dijagnostičkim ili intervencijskim kardiološkim zahvatima u kojima se kao pristupna točka upotrebljava femoralna arterija. Cilj tog ispitivanja bio je utvrditi sigurnost, učinak i učinkovitost sustava FemoSeal™ VCS. Bilo je to prospektivno, multicentrično, otvoreno ispitivanje jedne skupine s 30-dnevnim praćenjem.

Primarna mjera ishoda učinkovitosti bilo je vrijeme do hemostaze definirane kao odsutnost snažnog krvarenja. Primarna sigurnosna mjera ishoda bila je pojava velikih vaskularnih komplikacija tijekom 30 dana. Sekundarne mjere ishoda obuhvaćale su vrijeme do pokretljivosti, udio neuspješnog liječenja, incidencija štetnih događaja i značajke funkcije proizvoda tijekom uvođenja i postavljanja.

Pacijenti uključeni u to ispitivanje bili su odrasli koji su mogli dati informirani pristanak te imali neoštećen puls na najmanje jednom stopalu. Pacijenti su bili isključeni iz ispitivanja ako su imali bilo koje od sljedećih stanja:

- povijest bolesti perifernih krvnih žila
- autoimune bolesti
- poznati poremećaj krvarenja ili tešku anemiju
- INR >1,5
- infarkt miokarda unutar 72 sata
- nekontrolirana hipertenzija unatoč liječenju
- pretilost koja sprečava pristup Seldingerovom tehnikom
- prisutnost vaskularnog presatka ili stenta na mjestu arteriotomije
- prethodna ipsilateralna punkcija unutar 3 mjeseca
- očekivano trajanje života < 6 mjeseci.

Osim toga, pacijenti su intraoperativno pregledani i isključeni iz ispitivanja ako je zapaženo bilo što od sljedećeg:

- promjer lumena zajedničke femoralne arterije <5 mm
- arterijske grane unutar 2 cm proksimalno od mjesta punkcije
- značajna stenoza unutar 3 cm od mjesta punkcije
- uporaba primarne uvodnice ovojnice > 6 Fr
- punkcija na mjestu bifurkacije femoralne arterije ili distalno od nje
- višestruke femoralne punkcije
- poznate ili suspektne punkcijske ozljede stražnje stijenke femoralne arterije
- veliki hematoma (2:6 cm) nakon dovršetka zahvata
- teško uvođenje primarne ovojnice za zahvat zbog tortuoznog tkiva ili krvne žile.

To ispitivanje prema jednom planu ispitivanja provedeno je u dva dijela: tijekom 1. dijela uključeno je 20 pacijenata, zatim je izrađena sigurnosna analiza, a potom je u 2. dijelu uključeno dodatnih 60 pacijenata.

U 1. dijelu srednja dob uključenih pacijenata bila je 65,9 godina, 70,0 % bolesnika bili su muškarci, a 95 % bolesnika uzimalo je druge lijekove. U 2. dijelu ispitivanja srednja dob bila je 63,8 godina, 78 % bili su muškarci, a 100 % ispitanika uzimalo je druge lijekove.

Za uključivanje u ispitivanje prihvatljivi su bili pacijenti koji se podvrgavaju dijagnostičkim (1. i 2. dio) ili intervencijskim (2. dio) zahvatima kateterizacije srca. Zahvati su bili u skladu sa standardom njege u svakoj od bolnica u kojima su se uključivali pacijenti, nakon čega je slijedila primjena sustava FemoSeal™ VCS. Podatci o pacijentima prikupljeni su na početku ispitivanja, tijekom zahvata te 1 dan i 30 dana nakon zahvata. Rezultati su sažeti u **tablici 1.5** i pokazuju da je sustav FemoSeal™ VCS siguran i učinkovit za uporabu u toj populaciji pacijenata.

**Tablica 1.5 Klinički rezultati navedeni u ispitivanju prije stavljanja u promet**

<sup>a</sup> Na temelju ukupne veličine uzorka od 58 pacijenata jer u 2 pacijenta nije postignuta hemostaza u vrijeme zahvata zbog prethodnih ipsilateralnih punkcija. Hemostaza je u tih pacijenata ostvarena nakon 7 minuta i 37 minuta.

<sup>b</sup> Na temelju ukupne veličine uzorka od 59 pacijenata: 1 pacijent nije bio uključen jer je bio postavljen na respirator zbog plućnog edema te dulje od tjedan dana nije bio pokretan.

<sup>c</sup> Definirane kao vaskularne komplikacije koje zahtijevaju transfuziju krvi ili kirurški popravak, lokalna infekcija koja zahtijeva primjenu antibiotika, hospitalizaciju ili produljenje hospitalizacije ili ekscizija rane na mjestu zahvata.

U 1. dijelu ispitivanja nisu zapažene nikakve ozbiljne vaskularne komplikacije. U 2. dijelu ispitivanja prijavljena je jedna velika vaskularna komplikacija: pseudoaneurizma koja je zabilježena u roku od jednog dana nakon zahvata. Kod tog događaja bila je potrebna kompresija pod ultrazvučnim vođenjem i injekcija trombina u pseudoaneurizmu te produljenje pacijentove hospitalizacije.

Od pet štetnih događaja prijavljenih u 1. dijelu ispitivanja, došlo je do jednog štetnog događaja potencijalno povezanog s proizvodom: štetni događaj, koji nije bio ozbiljan, snažnog krvarenja 1 dan nakon zahvata. Od 19 štetnih događaja prijavljenih u 2. dijelu ispitivanja uočena su tri štetna događaja hematoma povezana s proizvodom, a koji nisu bili ozbiljni, kao i šest štetnih događaja moguće povezanih s proizvodom koji nisu bili ozbiljni, a obuhvaćali su tri izvještaja o dugotrajnom curenju, dva hematoma i jednu bol u nozi nakon tjelovježbe.

U 2. dijelu 3 pacijenta smatrala su se neuspješnima u liječenju: 2 zbog nemogućnosti postizanja hemostaze bez primjene kompresije i 1 zbog velike vaskularne komplikacije (pseudoaneurizme). Nije bilo neuspješnog liječenja u 1. dijelu ispitivanja.

Od šest kvarova proizvoda u 2. dijelu ispitivanja tri nisu ometala zahvat, jedan je bio pripisan korisničkoj grešci, jedan se odnosio na curenje iz uvodnice, a jedan je bio puknuće zgloba filamenta. Posljednja su dva problema obuhvaćena implementiranjem ažuriranja modela u C11202.

U 2. dijelu kliničkog ispitivanja prije stavljanja u promet nisu bili prijavljeni rezultati 6-mjesečnog praćenja zbog pacijentova nepridržavanja plana ispitivanja. Rezultati nakon kliničkog

ispitivanja prije stavljanja u promet (EU-SE-001) nakon 30 dana, što je u skladu s razdobljem praćenja iz kliničke literature, pokazuju da je sustav FemoSeal™ VCS siguran i učinkovit.

### 1.4.2 Sažetak podataka iz kliničkih ispitivanja nakon stavljanja u promet

U **tablici 1.6** u nastavku opisana su četiri klinička ispitivanja nakon stavljanja u promet. Ta klinička ispitivanja nisu objavljena ni dostupna na internetu.

**Tablica 1.6 Kliničke studije nakon stavljanja lijeka u promet**

|--|--|--|--|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Ispitivanje iz 2006. provedeno je kako bi se potvrdila sigurnost i učinkovitost trenutnog uređaja s poboljšanim sustavom uvođenja te kako bi se dobile povratne informacije o uputama za uporabu i programu obuke za sustav FemoSeal™ VCS. Ispitivanje je obuhvaćalo 100 pacijenata i primarna mjera ishoda bila je li postignuta hemostaza ili je bila potrebna dodatna ručna ili mehanička kompresija. Ovim je ispitivanjem zaključeno da je primjena sustava FemoSeal™ VCS u većini slučajeva bila uspješna (u 91 % postignuta je trenutna hemostaza).

U ispitivanje iz 2008. uključeno je 50 pacijenata radi procjene sigurnosti i učinkovitosti sustava FemoSeal™ VCS pri uporabi u normalnim kliničkim postupcima u pacijenata podvrgnutih kateterizaciji srca s pomoću uvodnice od 7 Fr. Primarna mjera ishoda ispitivanja bilo je prikupljanje podataka o vremenu do hemostaze i vremenu do pokretljivosti bez dodatne kompresije, ručne ili mehaničke. Prema rezultatima ispitivanja zaključeno je da je srednje vrijeme do hemostaze iznosilo 57,8 sekundi te da su svi pacijenti bili pokretni nakon 4 sata ležanja u krevetu.

Ispitivanjem iz 2009. procjenjivalo se novo pakiranje sustava FemoSeal™ VCS. U ispitivanje je bilo uključeno dvadeset i pet pacijenata. Primarna mjera ishoda bila je je li korisnik imao bilo kakvih problema s ambalažom. Korisnici nisu primijetili nikakve probleme u vezi s novom ambalažom sustava FemoSeal™ VCS. Ovim ispitivanjem prikupljali su se i podaci o vremenu do postizanja hemostaze.

Cilj je tog ispitivanja iz 2022. bio proaktivno prikupiti podatke o sigurnosti i učinkovitosti sustava FemoSeal VCS pri postizanju hemostaze pristupnih mjesta na zajedničkoj femoralnoj arteriji na stvarnim pacijentima podvrgnutima perkutanom endovaskularnim zahvatima. U ispitivanje je bilo uključeno 230 pacijenata. Primarne mjere ishoda tog registra su uspješnost zahvata (tj. uspješnost hemostaze na mjestu punkcije) i smanjenje glavnih komplikacija (npr. ozljeda vaskularnog sustava, krvarenje povezano s pristupnim mjestom, infekcija na mjestu pristupa, ponovna ručna kompresija i nova ipsilateralna akutna ishemija noge povezana s pristupom). Studija je zaključila da FemoSeal™ VCS dobro funkcionira u stvarnim uvjetima te osigurava učinkovitu hemostazu i nisku stopu komplikacija na mjestu pristupa za pacijente koji se podvrgavaju perifernim endovaskularnim intervencijama. Pokazuje dobre performanse s

kratkim vremenom do hemostaze i dobrom povratnom informacijom o upotrebljivosti za operatera, što FemoSeal™ VCS čini vrijednim uređajem za zatvaranje femoralnog pristupa.

### 1.4.3 Sažetak podataka iz kliničkog praćenja nakon stavljanja lijeka u promet

#### 1.4.3.1 Završeno kliničko praćenje nakon stavljanja u promet

Sažetak dovršenih aktivnosti kliničkog praćenja nakon stavljanja na tržište opisan je u **Tablici 1.7** u nastavku.

**Tablica 1.7. Aktivnosti kliničkog praćenja nakon stavljanja lijeka na tržište**

Tvrtka Terumo Medical Corporation ispunila je tri visokokvalitetna upitnika za liječnike tijekom trenutnog izvještajnog razdoblja (01. rujna 2019. - 31. kolovoza 2024.).

Kliničkim anketama o proizvodu FemoSeal™ prikupljeni su proaktivni klinički podaci o sigurnosti i učinkovitosti sustava FemoSeal™ VCS tijekom kliničke uporabe. Anketa je obuhvaćala pitanja usmjerena na cijeli proizvod i povezani pribor, uključujući žicu vodilicu od 0,038", te njihove međusobne interakcije. Kliničkim anketama o žici vodilici prikupljeni su proaktivni klinički podatci o sigurnosti i učinkovitosti tijekom kliničke uporabe žice vodilice od 0,038" isporučene uz sustav FemoSeal™ VCS. Anketna pitanja bila su posebno usmjerena na opću uporabu žice vodilice u rasponu od uvođenja kroz ovojnicu u krvnu žilu do vađenja žice.

Sustav FemoSeal™ VCS i žica vodilica od 0,038" uključena uz proizvod dobili su sve prihvatljive ocjene, a podneseno je šest (6) pritužbi za proizvod te devet (9) napomena koje nisu

bile pritužbe u vezi sa žicom vodilicom na temelju procjene komentara dobivenih iz tih visokokvalitetnih kliničkih ispitivanja. Pritužbe su procijenjene i za FemoSeal i za žicu vodilicu, a procijenjene su u okviru postupka praćenja nakon stavljanja u promet društva Terumo. Nisu utvrđeni nikakvi novi rizici ni razine rizika.

Anketa liječnika-korisnika dovršena je 2024. kao dio aktivnosti PMCF-a. Rezultati ankete pokazali su da su ocjena učinkovitosti i sigurnost sustava FemoSeal™ VCS sveukupno vrlo povoljni. Dokazana je i kompatibilnost žica vodilica koje nisu standardne i koje se isporučuju sa sustavom FemoSeal™ VCS.

#### **1.4.3.2 Stalno/planirano kliničko praćenje nakon stavljanja u promet**

TMC ima jednu trenutačnu/planiranu aktivnost kliničkog praćenja nakon stavljanja u promet. Izvršit će se klinička anketa radi prospektivnog prikupljanja povratnih informacija u vezi s uporabom žice vodilice sa sustavom FemoSeal VCS distribuiranim na tržištu EU-a. Liječnici će ispuniti anketu kako bi se proučilo koje su žice vodilice upotrebljavali tijekom zahvata. Svrha ove ankete je riješiti nedostatak identificiran kao nedostatak literature i komentara vanjskih recenzenata o kompatibilnosti sustava FemoSeal™ VCS s upotrebom drugih žica vodilica koje nisu marke Terumo. Povratne informacije uključuju tehničke ishode, kliničku učinkovitost i sigurnost koji se odnose na učinkovitost proizvoda s različitim žicama vodilicama.

#### **1.4.4 Sažetak podataka iz sustavnog pregleda literature**

Terumo Medical Corporation provodi sustavne preglede literature radi prikupljanja i procjene kliničkih podataka o sigurnosti i učinkovitosti iz objavljenih ispitivanja proizvoda FemoSeal™ VCS i/ili sličnih proizvoda. Cilj je godišnjeg pregleda objavljene literature utvrditi prethodno nepoznate nuspojave, nadzirati poznate nuspojave, prepoznati nenadane rizike te prepoznati moguću sustavnu zlorabu ili uporabu izvan odobrene indikacije proizvoda FemoSeal™ VCS.

Najnoviji sustavni pregled literature, koji je obuhvatio razdoblje od 1. rujna 2019. do 31. kolovoza 2024., identificirao je 29 objavljenih studija koje su pružile podatke o kliničkoj sigurnosti i učinkovitosti FemoSeal™ VCS. Dvadeset i tri reference izvijestile su o upotrebi FemoSeal™ VCS-a u skladu s odobrenim indikacijama, a upotreba izvan odobrenih indikacija zabilježena je u devet studija. Općenito, pregledom literature ispitivanja specifičnih za uporabu sustava FemoSeal™ VCS utvrđena je populacija iz ispitivanja reprezentativna za bolesnike u EU-u podvrgnute perkutanim zahvatima vaskularne kateterizacije. Popis ovih 23 publikacija recenziranih od strane stručnjaka nalazi se u **dijelu 3**.

Klinička učinkovitost procijenjena je sljedećim mjerama:

- Vrijeme do hemostaze je bolje ili usporedivo s najsuvremenijim postupcima perkutanog zatvaranja zajedničke femoralne arterije.
- Vrijeme do pokretanja je bolje ili usporedivo s najsuvremenijim metodama perkutanog zatvaranja zajedničke femoralne arterije.
- Stopa postoperativnih komplikacija usporediva je ili niža od trenutanih standarda skrbi.

Na temelju tih kliničkih mjera učinkovitosti, prema podacima iz tog pregleda literature utvrđeno je da se sustav FemoSeal™ VCS može uspješno upotrebljavati pri zatvaranju femoralne arterijske punkcije (arteriotomija) u pacijenata podvrgnutih perkutanoj kateterizaciji s pomoću uvodne ovojnice od 7 Fr ili manje. Potpuna hemostaza postignuta je u većine bolesnika (79,65-100%) slučajeva i bila je povezana s medijanom vremena do hemostaze od 0,5 min, srednjim vremenom do otpusta od 3 dana. Između 69,2 i 86,7 % pacijenata moglo je hodati 5 sati nakon zatvaranja, uz prosječni postoperativni odmor od 349 minuta. Zatajenje sustava FemoSeal™ VCS uočeno je u 3,68 - 4 % slučajeva, a dodatna ručna kompresija bila je potrebna u 0,9 - 4,4 % postupaka.

Klinička sigurnost procijenjena je na temelju štetnih događaja, uključujući među ostalim:

- Krvarenje
- Hematom
- Pseudoaneurizma
- Modrice
- Arterijsko-venska fistula
- Infekcija
- Smrt

Za svaki od tih štetnih događaja učestalost pojave kod sustava FemoSeal™ VCS u obuhvaćenim ispitivanjima bila je manja ili usporediva s povijesno prijavljenim učestalostima za ručnu kompresiju i druge proizvode za zatvaranje krvnih žila.

Nisu utvrđeni nikakvi štetni događaji pregledom 10 izvještaja o slučajevima jer nisu utvrđeni nikakvi novi, nepredvidivi, nepoznati ni neprihvatljivi rizici.

Ukupna učinkovitost korištenja FemoSeal™ VCS-a tijekom dijagnostičke angiografije ili intervencijskih operacija ovisi o više čimbenika kao što su: spol, dob, anatomija pacijenta, komorbiditeti, anatomske položaj mjesta uboda, iskustvo kirurga, metoda postavljanja VCD-a, postoperativna njega itd. Osim tehničkog uspjeha, uključujući postizanje hemostaze, sustav FemoSeal™ VCS nudio je i kliničke koristi u odnosu na zatvaranje krvnih žila nakon punkcije femoralne arterije, kao što je smanjenje vremena do hemostaze, smanjenje vremena do pokretljivosti. Rezultati performansi za FemoSeal™ VCS sukladni su onima koji se očekuju za

ovu vrstu uređaja kada se koristi prema namjeni. Neki od referencija dobivenih tijekom trenutačnog razdoblja pretraživanja pokazali su upotrebu predmetnog uređaja na anatomskom mjestu koje nije zajednička femoralna arterija i za zatvaranje arteriotomija  $> 7$  Fr, što se smatra izvan oznake.

Tijekom pregleda nisu utvrđene nepoznate nuspojave, novi rizici ili moguća sustavna zlouporaba uređaja. Međutim, ako sustav FemoSeal™ VCS pažljivo upotrebljavaju obučeni liječnici, medicinski proizvod funkcionira kao koristan i potreban klinički proizvod. Općenito, ciljana terapija, a time i sustav FemoSeal™ VCS, rješava kliničku potrebu koja trenutačno postoji u liječenju komplikacija povezanih s vaskularnim pristupom.

Općenito, podacima u ovom pregledu literature nisu identificirani nikakvi problemi u vezi s učinkovitosti ni sigurnosti u kliničkom okruženju koji su prethodno bili nepoznati, kao ni štetni događaji čija je učestalost viša od predviđene/prihvatljive. Stoga se na temelju tog pregleda literature može zaključiti da sustav FemoSeal™ VCS, kada se upotrebljava za omogućavanje kompresije hemostaze kod arteriotomije nakon perkutane kateterizacije, nastavlja funkcionirati kako se očekuje i nije povezan s ozbiljnim sigurnosnim događajima.

#### 1.4.5 Sažetak podataka nakon stavljanja u promet

Uspostavljen je proaktivni sustav za nadzor nakon stavljanja u promet (engl. Post-Market Surveillance, PMS), a pregled svih pritužbi obavlja se na mjesečnoj osnovi i u skladu s internim proizvodnim postupcima. Podaci o prigovorima analizirani su u razdoblju od 1. rujna 2019. do 31. kolovoza 2024. Ukupno je proizvođaču podneseno 28 izvješća o nadzoru medicinskih proizvoda (MDV) i 476 izvješća o pritužbama kupaca. Od 28 izvješća o MDV-u, 27 je bilo povezano sa štetnim događajima, a jedno s kvarom uređaja. Tijekom izvještajnog razdoblja došlo je do dvije smrti, ali nije procijenjeno da je nijedna od prijavljenih smrti povezana s ispitanim proizvodom. Među 476 pritužbi podnesenih proizvođaču, najčešći razlozi za pritužbe bile su poteškoće s implementacijom (146 slučajeva, stopa pojavljivanja 0,0142%). Način kvara uzrokovan izvlačenjem je drugi najčešći sa stopom od 0,0126% (130 događaja).

FemoSeal™ sustav za zatvaranje krvnih žila ima preko 1.030.136 prodaja diljem svijeta i 827.843 u Europskom gospodarskom prostoru. Izračunata učestalost pritužbi na temelju globalne prodaje iznosi 0,043%. Ukupna stopa pritužbi kupaca vrlo je niska. Nisu utvrđeni nikakvi novi rizici koji već nisu uključeni u uputama za uporabu i dokumentaciji o rizicima.

Stope pojave neželjenih nuspojava prikazane su u **Tablici 1.2**. U pritužbama nisu utvrđeni novi nepredviđeni, nastali ili neprihvatljivi rizici. Nije došlo do značajnog povećanja učestalosti ili težine poznatih neželjenih nuspojava.

#### 1.4.6 Opći sažetak kliničke učinkovitosti i sigurnosti

Sustav FemoSeal™ VCS indiciran je za uporabu kod zatvaranja punkcije zajedničke femoralne arterije (arteriotomije) u pacijenata podvrgnutih perkutanoj kateterizaciji s pomoću uvodne ovojnice od 7 F (2,33 mm) ili manje. Ova klinička procjena temelji se na sveobuhvatnoj analizi dostupnih kliničkih podataka i literature, koji su relevantni za predviđenu namjenu proizvoda FemoSeal™ VCS, prije i nakon stavljanja u promet.

Proveden je sveobuhvatan pregled objavljene literature koji obuhvaća razdoblje od 1. rujna 2019. do 31. kolovoza 2024. Skup dokaza obuhvaćao je 29 ispitivanja sustava FemoSeal™ VCS. Iz dokaza pruženih u kliničkoj procjeni može se zaključiti da je predmetni proizvod siguran i učinkovit kada se upotrebljava u skladu s indikacijama te da su svi rizici ili neželjene nuspojave koji mogu biti povezani s proizvodom u normalnim uvjetima upotrebe prihvatljivi s obzirom na koristi za pacijenta. Ishodi izvedbe predmetnih proizvoda dosljedni su onima koji se očekuju za ovu vrstu uređaja kada se oni upotrebljavaju u skladu s namjenom.

Potencijalne neželjene nuspojave povezane s uporabom sustava FemoSeal™ VCS obuhvaćaju nuspojave koje se obično prijavljuju u vezi s alternativnim načinima zatvaranja arteriotomije, npr. krvarenje i hematoma. Sveukupno, stope učestalosti štetnih događaja prijavljenih uz uporabu sustava FemoSeal™ VCS slične su stopama prijavljenima za ručnu kompresiju i slične proizvode za zatvaranje krvnih žila. Konkretno, stope učestalosti za krvarenje i hematoma prijavljene za sustav FemoSeal™ VCS manje su od prijavljenih stopa za slične proizvode za zatvaranje krvnih žila. Svaki prijavljeni štetni događaj, i iz objavljene literature i na temelju praćenja nakon stavljanja u promet, prethodno je bio utvrđen (pogledajte **dio 1.3**).

Postojeći podaci o kliničkoj sigurnosti i učinkovitosti uređaja FemoSeal VCS upućuju na to da koristi za pacijenta od korištenja ovog uređaja za zatvaranje krvnih žila nadmašuju moguće rizike kada se koristi u skladu s Uputama za uporabu.

Kao što je naznačeno u prethodnim dijelovima, podaci dostavljeni za FemoSeal™ VCS pokazuju dosljednost između podataka vezanih uz uređaj koji se procjenjuje (npr. korištenje uređaja, sigurnosni ishodi, klinička učinkovitost i kliničke koristi), identificiranih ekvivalentnih uređaja i podataka vezanih uz slične uređaje navedene u dokumentu o trenutnom stanju tehnike.

Unakrsna analiza sigurnosnih podataka nije utvrdila nikakve razlike između sljedećeg:

- podataka spomenutih u najnovijim dostignućima
- podataka specifičnih za uređaj koji se procjenjuje
- podataka spomenutih u datotekama upravljanja rizikom
- podataka navedenih na oznakama i/ili u uputama za upotrebu (tj. obrađuju se preostali rizici koji se moraju prenijeti korisniku).

Klinička sigurnost dokazana je niskim stopama komplikacija utvrđenim u objavljenj, pregledanoj kliničkoj literaturi, kliničkim studijama koje je sponzorirala tvrtka, pregledu podataka nakon stavljanja na tržište, uz istovremeno odsustvo povlačenja proizvoda s tržišta. Nisu utvrđene nikakve zabrinutosti u vezi s učinkovitošću, pregledana literatura sadržavala je upotrebu FemoSeal™ VCS koja je bila u skladu s namjenom proizvođača..

### **1.5 Moguće dijagnostičke ili terapijske alternative**

Ručna kompresija tradicionalno se upotrebljava za postizanje hemostaze na mjestu arteriotomije nakon vaskularnih kateterizacija. Ručna kompresija povezuje se s duljom imobilizacijom pacijenta (do 8 sati nakon postupka) te sa znatnom nelagodom i produženim boravakom u bolnici. Nedavnim sustavnim pregledom utvrđeno je da je srednje vrijeme za postizanje hemostaze uz ručnu kompresiju bilo 20,8 minuta.<sup>1</sup>

Alternative ručnoj kompresiji obuhvaćaju vanjske hemostatske proizvode koji primjenjuju mehaničku kompresiju na mjesto arteriotomije. Ti proizvodi ne skraćuju vrijeme do hemostaze ni vrijeme do pokretljivosti, ali smanjuju potrebe osoblja zamjenom ručne kompresije mehaničkom kompresijom. Stope učestalosti štetnih događaja povezanih s upotrebom mehaničke kompresije slične su stopama kod ručne kompresije.

Proizvodi za zatvaranje krvnih žila, kao što je sustav FemoSeal™ VCS, dizajnirani su za zatvaranje arteriotomije. Cilj im je smanjiti vrijeme do hemostaze i omogućiti raniju pokretljivost. Nedavnim sustavnim pregledom, uključujući 13 komercijalno dostupnih proizvoda, utvrđeno je da je srednje vrijeme za postizanje hemostaze s proizvodom za zatvaranje krvnih žila iznosilo 5,4 minute. Medijan vremena do postizanja hemostaze za pojedinačne proizvode za zatvaranje krvnih žila u rasponu je od 1 minute (sustav FemoSeal™ VCS) do 14 minuta, dok je većina proizvoda između 4 i 10 minuta.<sup>1</sup>

Najčešće zabilježeni štetni događaji povezani sa zatvaranjem mjesta arteriotomije, s ručnim kompresijama, vanjskim hemostatskim proizvodima ili proizvodima za zatvaranje krvnih žila, obuhvaćaju hematome, krvarenje na mjestu pristupa, pseudoaneurizme, arteriovenske fistule i infekcije. Isti sustavni pregled (34 randomizirana kontrolirana ispitivanja, 14.401 pacijent) otkrio je da su stope štetnih događaja bile slične između ručne kompresije i uporabe proizvoda za zatvaranje krvnih žila, uz iznimku da je krvarenje bilo malo veće kod proizvoda za zatvaranje krvnih žila.<sup>1</sup>

## 1.6 Predloženi korisnički profil i obuka

Predviđeni su korisnici sustava FemoSeal™ Vascular Closure System liječnici koji su završenom obukom kvalificirani za obavljanje arterijskog pristupa i zatvaranja u okviru endovaskularnih zahvata kroz zajedničku femoralnu arteriju te koji su sudjelovali u programu obuke za liječnike za FemoSeal™ društva Terumo Medical Corporation.

A biztonságosságra és klinikai teljesítőképességre vonatkozó összefoglaló (SSCP) célja, hogy nyilvánosan hozzá lehessen férni a FemoSeal™ Vascular Closure System biztonságosságára és klinikai teljesítőképességére vonatkozó fő aspektusok frissített összefoglalójához.

Az alábbiakban a felhasználóknak/egészségügyi szakembereknek szánt eszköz biztonságosságát és klinikai teljesítőképességét összegezzük, lásd **1.0 szakasz**

## **1.0 ÖSSZEGZÉS FELHASZNÁLÓKNAK/EGÉSZSÉGÜGYI SZAKEMBEREKNEK**

Az SSCP nem helyettesíti a Használati útmutatót, amely az eszköz biztonságos használatáról szóló elsődleges dokumentum, és nem célja diagnosztikai vagy terápiás javaslatok nyújtása a célfelhasználóknak és betegeknek. Az SSCP nem helyettesíti az implantátumkártyákon vagy más kötelező dokumentumokban található kötelező információkat.

### **1.1 Az eszköz rendeltetésszerű használata**

#### **1.1.1 Rendeltetés**

A FemoSeal™ Vascular Closure System egy olyan orvosi eszköz, amely az artériás punkció lezárására szolgál a közös combartérián keresztüli perkután katéterezés után.

#### **1.1.2 Felhasználási javallatok**

A FemoSeal™ Vascular Closure System használata a közös combartéria-punkció (arteriotomia) lezárására javallott olyan betegeknél, akik 7F (2,33 mm) vagy kisebb bevezetőhüvely segítségével perkután katéterezéssel estek át.

#### **1.1.3 Ellenjavallatok és/vagy korlátozások**

A FemoSeal™ Vascular Closure System ellenjavallott olyan betegeknél, akiknél az arteriotomiák során 7F-nél (2,33 mm) nagyobb hüvelyt vagy eszközt használtak.

#### **1.1.4 Tervezett betegpopuláció**

A FemoSeal™ Vascular Closure System biztonságosságát és hatékonyságát 18 éves és idősebb betegeknél állapították meg, akik 7F (2,33 mm) vagy kisebb bevezetőhüvely alkalmazásával perkután katéterezéssel estek át.

#### **1.1.5 Különleges betegcsoportok**

A FemoSeal™ Vascular Closure System biztonságosságát és hatásosságát az alábbi betegpopulációkban nem igazolták:

- Fennálló autoimmun betegségben szenvedő betegek.
- Terápiás trombolízisben részesülő betegek.
- Klinikailag jelentős perifériás érbetegségben szenvedő betegek.
- Kontrollálatlan hipertónia ( $> 220$  Hgmm szisztolés vagy  $> 110$  Hgmm diasztolés) esetén.
- Vérzési zavarban szenvedő betegek, beleértve a thrombocytopeniát ( $< 100\,000$  trombocitaszám) vagy anaemiát (Hgb  $< 10$  mg/dl).

- Azon betegek, akiknél a közös combartéria belső lumene 5 mm-nél kisebb.
- Vese- vagy májkárosodásban szenvedő betegek.
- Egyéb releváns társbetegségben szenvedő betegek.
- Specifikus rasszhoz tartozó és/vagy etnikai származású betegek.
- Myocardialis infarktusból szenvedő betegek 72 órán belül.
- Ér-grafttal vagy sztenttel rendelkező betegek a punkció helyén.
- Terhes vagy szoptató betegek.
- 18 év alatti betegek.

### 1.1.6 Célfelhasználók

A FemoSeal™ Vascular Closure System tervezett felhasználói azok az orvosok, akik a közös combartérián keresztül képesek elvégezni az artériás hozzáférést és az endovaszkuláris eljárások lezárását, és részt vettek a Terumo Medical Corporation FemoSeal™ orvosoknak szóló oktatásán.

## 1.2 Az eszköz leírása

### 1.2.1 Az eszköz leírása

A Terumo Medical Corporation (TMC) által gyártott FemoSeal™ Vascular Closure System egy felszívódó érlezáró eszköz, amelyet arra terveztek, hogy a közös combartérián keresztüli perkután katéterezést követően combartériás vérzéscsillapítást érjen el.

A FemoSeal™ záróelemek két felszívódó polimer korongból, a belső tömítőkorongból és a külső zárókorongból állnak, amelyeket egy felszívódó sodrott fonal (multifilamentum) tart össze, ezáltal mechanikusan zárva az arteriotómiát. (lásd **1.1 ábra** és **1.2 ábra**) A kónusz burkolóhévelyén keresztül történő behelyezés után a külső rögzítőkorongot rá kell ütni a multifilamentum szára, ami a punkció helyének mechanikus lezárását eredményezi a belső és a külső zárólemez között. A belső és a külső zárókorongot a sodrott fonal tengely súrlódása tartja a helyén. A vérzéscsillapítás mechanikus eszközökkel érhető el. A záróelemek hidrolízis hatására elhasználódnak.

A beültethető zárókomponensek, a belső tömítés és a külső zárókorong tizennyolc (18) hónapon belül lebomlanak, míg a multifilamentum lebomlik és hidrolízissel felszívódik a környező szövetekben a becslések szerint két (2) - három (3) év után. A beültethető zárókomponenseknek az arteriotómián belüli kompresszió fenntartására való képességét nyolc (8) órán át vizsgálták. A

bomlástermékek a vizeletben metabolizálódnak és kiválasztódnak, vagy a tüdőkön keresztül szén-dioxid formájában kilégzésre kerülnek. Állatkísérletek során nem figyeltek meg felhalmozódásos hatásokat. A FemoSeal™ további összetevői, amelyek az eljárás során érintkeznek élő szövettel vagy vérrel, a kúp burkolóhüvelye, a tágitóeszköz, a tömítőcső, a tolóka és a vezetődrót.

### 1.1 ábra Belső tömítőkorong és külső zárókorong

### 1.2 ábra. A belső tömítőkorong és a külső zárókorong behelyezve

A FemoSeal™ egység egy tágitóval és egy 0,038" (0,97 mm) külső átmérőjű, 27,5" (70 cm) hosszú vezetődróttal és egy J-egyenesítővel együtt kerül csomagolásra, lásd az alábbi, **1.3 ábrát**. A vezetődrót egy polietilén csőben található. Minden alkatrész egy rögzített papírtartó tálcába van csomagolva. A csomagolás tartalmazza a beteg implantátum kártyáját is. A FemoSeal™ Vascular Closure System nem igényel további kiegészítőket az eszköz rendeltetésszerű működéséhez, és az eszközt kizárólag a termék csomagolásában található tágitóval és vezetődróttal szabad használni.

### 1.3 ábra FemoSeal™ VCS egység vezetődórral és tágitóval

### 1.2.2 Nyersanyagok és összetevők

Az alábbi 1.1 táblázat ban a FemoSeal™ VCS komponenseinek listája látható.

1.1 táblázat. FemoSeal™ VCS nyersanyagok és komponensek

| Akatrész száma | Leírás                                     |                                               | Anyagok                                                                                                                                                                       |

\* Az eszköz beültethető része; a beültethető komponensek MR-biztosak

A FemoSeal™ VCS etilén-oxiddal (EO) van sterilizálva, és egyszer használatos orvostechnikai eszköz. A FemoSeal™ VCS eszköz kialakítása olyan, hogy nem használható fel újra.

### **Működés módja**

A FemoSeal™ VCS elősegíti a mechanikus vérzéscsillapítást azáltal, hogy beültethető záróelemeket helyez el a közös combartérián belül és kívül. A vérzést megakadályozó mechanizmust a punkció helyét lezáró belső tömítés és a belső tömítést a helyén tartó külső zárókorong biztosítja.

#### **1.2.3 Klinikai előny**

A FemoSeal™ VCS az alábbi klinikai előnyöket biztosítja a közös combartéria punkciót követő érlezárással szemben:

- A vérzéscsillapításra fordított idő csökken <sup>1</sup>
- Az ambulációra fordított idő csökkentése <sup>1</sup>

#### **1.2.4 Előző generáció(k) vagy változatok**

- A FemoSeal™ VCS (#11200) első verzióját 2005-ben és 2006-ban értékesítették az európai piacon.
- A továbbfejlesztett behelyező rendszerrel rendelkező FemoSeal™ VCS (#11202) 2006. március 28-tól kapható a piacon.

#### **1.2.5 Az eszközzel együtt használandó tartozékok**

A FemoSeal™ egység egy tágitóval, egy 0,038" (0,97 mm) külső átmérőjű, 27,5" (70 cm) hosszú vezetődróttal és egy J-egyenesítővel van csomagolva. A vezetődrót a FemoSeal™ egység tartozéka. A J-egyenesítő a vezetődrót része, míg a tágitó a FemoSeal™ egység része. A vezetődrót az egyetlen figyelembe vett tartozék. A vezetődrót egy polietilén csőben található. Minden alkatrész egy rögzített papírtartó tálcába van csomagolva. A csomagolás tartalmazza a beteg implantátum kártyáját is. A FemoSeal™ Vascular Closure System nem igényel további kiegészítőket az eszköz rendeltetésszerű működéséhez, és az eszközt kizárólag a termék csomagolásában található tágitóval és vezetődróttal szabad használni.

#### **1.2.6 Az eszközzel együtt használandó egyéb eszközök és termékek**

A FemoSeal™ VCS nem igényel további eszközöket a rendeltetésszerű működéshez.

### **1.3 Kockázatok és figyelmeztetések**

#### **1.3.1 Fennmaradó kockázatok és nemkívánatos hatások**

A FemoSeal™ VCS használatából eredő fennmaradó kockázatok következményeként esetleg jelentkező ismert vagy előrelátható nemkívánatos események, sérülések és szövődmények felsorolása az **1.2 táblázatban** található. Az előfordulási arány a Kockázati dokumentáció elemzésén alapul, és a 2019. szeptember 1-től 2024. augusztus 31-ig tartó értékesítés utáni felügyeleti adatok alapján kerül kiszámításra. A FemoSeal™ VCS-nek nincsenek ismeretlen maradék kockázatai, és minden vonatkozó kockázatot kezeltek a Használati útmutató és a kockázatkezelési folyamat révén.

## 1.2 táblázat FemoSeal nemkívánatos események/szövődmények

### 1.3.2 Figyelmeztetések és óvintézkedések

#### Figyelmeztetések

1. Ne használja fel a terméket, ha a csomagolás sérült, vagy ha a steril gát nem sérült.
2. Ne használja fel a lejáratí idő után – a biológíailag lebomló összetevők nem feltétlenül működnek megfelelően.
3. Ne használja a terméket, ha az sérültnek vagy hibásnak tűnik.
4. FemoSeal™ Vascular Closure System használata, ahol az bevezetőhüvely vagy a környező szövetek bakteriális szennyeződése fertőzést okozhat.
5. Ha gyanítható, hogy a poszterior artériás fal át lett szúrva, vagy több artéria-punkció történt, ne hagyatkozzon kizárólag a FemoSeal™ Vascular Closure Systemre az artériás vérzéscsillapítás eléréséhez. Alkalmazzon további manuális vagy mechanikus kompressziót.
6. Ha a punkció helye a combartéria bifurkációja közelében vagy attól disztálisan van, a FemoSeal™ Vascular Closure Systemet nem szabad használni, mivel fennáll a belső tömítés nem megfelelő elhelyezkedésének kockázata. Ez az esemény vérzési szövődményeket és/vagy a normál véráramlás megszakadását eredményezheti.
7. Ha a bemetszés helyén tartós artériás vérzés alakul ki, ne vágja el a multifilamentumot, amíg a vérzést el nem éri. Ha nem sikerül vérzéscsillapítást elérni, rögzítse a multifilamentumot steril sebkötözővel, és alkalmazzon kiegészítő kompressziót, amíg el nem éri a vérzéscsillapítást. Tartós artériás vérzés esetén jelentős vérzéses szövődmények léphetnek fel, amelyek a beteg sérülését vagy halálát okozhatják.
8. Ne használja a FemoSeal™ Vascular Closure Systemet, ha a punkció helye proximálisan helyezkedik el az inguinalis szalaghoz képest, mivel ez retroperitoneális hematómát eredményezhet.
9. A vérzés szempontjából nagyobb kockázatú betegek fokozott vérvesztést szenvedhetnek, ami transzfúziót tehet szükségessé.
10. Ha a belső korong leválík, ez trombotikus és/vagy embóliás eseményt okozhat.

#### Óvintézkedések

1. A FemoSeal™ Vascular Closure System behelyezését olyan orvosoknak kell elvégezniük, akik megfelelő képzettséggel rendelkeznek az eszköz használatában.
2. A FemoSeal™ Vascular Closure System alkalmazása előtt végezzen korlátozott mértékű combartériás angiogramot vagy ultrahangos vezérlésű combartériás punkciót.
3. Szakítsa meg az eljárást, ha:

- A közös combartéria lumenátmérője < 5 mm.
  - Stenosis és/vagy jelentős lepedék van jelen a közös combartéria-punkció helyén.
  - Az artériás punkció a combartéria bifurkációjánál vagy attól disztálisan történik.
  - Rendellenes ágak vagy érrendellenességek vannak jelen a közös combartéria-punkció helyén.
4. Ha bármilyen hematóma van jelen, különös gonddal kell eljárni a kónusz burkolóhüvelyének az artériába történő megfelelő bevezetése érdekében.
  5. Használjon egyfalas punkciós technikát. Ne szúrja át az artéria hátsó falát.
  6. FemoSeal™ Vascular Closure System használata esetén mindig steril technikát alkalmazzon.
  7. A FemoSeal™ Vascular Closure System kizárólag egyszer használatos, és semmilyen módon nem szabad újrasztelizálni vagy újra felhasználni. A FemoSeal™ egység úgy van kialakítva, hogy nem használható fel újra.
  8. Ha a belső tömítés váratlan ellenállásba ütközik, szakítsa meg az eljárást.
  9. A belső tömítés megfelelő elhelyezéséhez helyezze vissza hüvelykujját, hogy a gomb szabadon visszaugorhasson.
  10. Bizonyosodjon meg arról, hogy a FemoSeal™ egység kónusz burkolóhüvelyének hegye a bőr felszíne alatt van, mielőtt a külső zárókorongot elhelyezné. A külső rögzítőkorong véletlenül a bőr szintje fölé helyezhető az combartéria és a bőr szintje közötti rövid távolsággal rendelkező betegeknél.
  11. A megfelelő elhelyezéshez a behelyezés előtt bőrmetszésre lehet szükség.
  12. Ha a belső tömítés az artériában található, de nem lehet teljesen lenyomni a gombot és behelyezni a külső zárókorongot, műtétre lehet szükség a FemoSeal™ záróelemek eltávolításához.
  13. Ha 18 hónapon belül ugyanazon combartéria újbóli punkciójára van szükség, a punkciót az előző FemoSeal™ Vascular Closure System hozzáférési helyétől legalább egy centiméterre proximálisan kell elvégezni.
  14. Utasítsa a beteget, hogy kövesse a lezárás helyének vizsgálatára vonatkozó orvosi utasításokat.
  15. Utasítsa a beteget, hogy mindig tartsa magánál a betegtájékoztató kártyát a következő 18 hónapban.

## **Óvintézkedések az elbocsátáskor**

Az elbocsátás megfontolása előtt mérje fel a beteget a következő klinikai állapotok szempontjából:

1. Vérzés és/vagy hematóma a lezárás helyén.
2. Sétálás közben fájdalom.
3. Fertőzés jelei a lezárás helyén.

### **1.3.3 Helyszíni biztonsági korrekciós intézkedések**

2019. szeptember 01-től 2024. augusztus 31-ig egyetlen helyszíni biztonsági korrekciós intézkedés történt a FemoSeal™ VCS rendszer kapcsán.

2022-ben a Terumo önkéntesen visszahívta a FemoSeal™ VCS tömítőeszközt olyan panaszok miatt, amelyek szerint az Elkton gyártóüzemben készült termékeknél hibák fordultak elő a tömörítőerő és a visszahúzóerő mérésére szolgáló gyártási és tételfelszabadítási tesztek során. Összesen 950 egységet hívtak vissza Dél-Koreából.

## **1.4 A klinikai értékelés és a forgalomba hozatalt követő klinikai utánkövetés**

Az **1.3 táblázat** tartalmazza a kulcsfontosságú vizsgálatok listáját, amelyek a FemoSeal™ VCS forgalomba hozatalát, valamint a forgalomba hozatal utáni vizsgálatok és a forgalomba hozatalt követő klinikai utánkövetési tevékenységek bemutatását szolgálják. A vizsgálat során használt eszközverziót az alábbi táblázat tartalmazza. A FemoSeal™ VCS (#11200) első verziója 2006-ig volt jelen a piacon, míg a következő változat (#C11202) 2006-ban jelent meg a piacon, és jelenleg ez az, ami jelenleg a piacon van.

### **1.3 táblázat: A pivotális vizsgálatok összefoglalása**

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Kivitelező: Biomatech, Franciaország | Állatkísérletek | A vizsgálat célja egy olyan biológiailag lebomló implantátum biokompatibilitásának és biofunkcionalitásának értékelése volt, amelyet az érrendszerben vérvéscsillapítás elérésére terveztek. A vizsgált eszközt az artériák punkciós nyílásába történő bevezetésre tervezték a vérvéscsillapítás elérése érdekében. Az egyik korong az artéria punkciós nyílásába hatolt, a másik pedig az artérián kívülről megszorította a belső korongot. Mindkét korongot egy behelyezőhüvelyen keresztül vezették be. A korongokat úgy tervezték, hogy megakadályozzák a vézést, begyógyuljanak az érfalba, végül lebomoljanak és felszívódnak. A vizsgálat célja a funkcionális implantátum, juhba és sertésbe történő beültetése utáni adatgyűjtés és -elemzés az implantátum kapacitásának értékelése a fiziológias funkció fenntartása tekintetében a keringési rendszerben történő használat során, a gazdaszervezet, illetve és az eszköz választának (a fizikai integritás, szöveti tokosodás áldozatával ) | Az implantációs időszak / utánkövetés minden állat esetében 5 hét<br><br>4 juh, 1 sertés<br><br>14 záróelem<br><br>8 záróelem, 2 juhba ültetve,<br><br>2 záróelem, 1 sertésbe ültetve<br><br>Amikor két záróelemet beültetettek ugyanabba a combartériába, azokat > 30 mm távolságban ültették be | <p>A mellékhatásokat (gyulladás, nekrozis, vérzés vagy bármilyen más lézió) vagy a vékony pszeudo-intimális rétegeképződést feljegyezték. Különös figyelmet fordítottunk az eszköz kezdeti csontbeépítésére, különös tekintettel a korongok belső tokosodására.</p> <p>Makroszkóposan nem figyelték meg jelentős helyi intolerancia vagy trombusképződés jeleit. A makroszkopikus megfigyelés nem mutatott ki különbséget a juh és a sertés között a záróelemek combartériákba történő beültetése után.</p> <p>Makroszkóposan nem figyelték meg jelentős helyi intolerancia vagy trombusképződés jeleit. A makroszkopikus megfigyelés nem mutatott ki különbséget a juh és a sertés között a záróelemek combartériákba történő beültetése után.</p> <p>A juh implantációs hely hisztopatológiai elemzése nem mutatott ki helyi mellékhatásokat. A belső és a külső korongok a degradáció jeleit mutatták, és néhány esetben kisebb</p> |

|                                                                                                                                                                                                              |                              |                                                             |                                                                                                                                                                                                                               |                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

A FemoSeal™ VCS forgalomba hozatal előtti fejlesztési tervének részeként három állati funkcionális tesztet végeztek el. 2000-ben a klinikai vizsgálatok megkezdése előtt állatkísérletet végeztek a FemoSeal™ VCS biofunkcionalitásának értékelésére. Ez a vizsgálat értékelte a záróelemek képességét a fiziológiai funkció fenntartására és lebomlásának értékelésére. 18 hónap elteltével a belső és külső korong anyaga már nem volt látható, a helyét endoluminális rostos szövet vette át. Következésképpen a FemoSeal™ VCS záróelem azon kapacitása, amely fenntartja a fiziológiás funkciót, amikor a keringési rendszerben használják.

2002-ben állatkísérletet végeztek egy biológiailag lebomló implantátum, a FemoSeal™ VCS biokompatibilitásának és biofunkcionalitásának értékelésére, amelyet az érrendszerben vérzéscsillapítás elérésére terveztek. Összefoglalva, az implantátum lebomlása a 36. hétre csaknem befejeződött, és nem volt jelentős káros szöveti reakció.

Egy másik állatkísérlet 2002-ben vizsgálta egy biológiailag lebomló implantátum, a FemoSeal™ VCS biokompatibilitását és biofunkcionalitását, amelyet az érrendszerben vérzéscsillapítás elérésére terveztek 5 hét elteltével a korong teljes mértékben betokozódott, és a belső és külső korongok esetében degradáció jeleit figyelték meg. Következésképpen, az implantátum azon képessége, hogy megőrzi a fiziológiás funkciót, amikor a keringési rendszerben használják, igazolást nyert.

A FemoSeal™ VCS klinikai fejlesztési tervének részeként a Radi Medical System AB forgalomba hozatal előtti klinikai vizsgálatot végzett. Ez a klinikai vizsgálat nem jelent meg és nem érhető el online. A #11200 eszköztípussal végzett vizsgálatot 2002–2004-ben végezték az EN 540 európai szabvány (orvostechnikai eszközök humánklinikai vizsgálata) szerint, valamint az ICH klinikai vizsgálatokra vonatkozó általános megfontolások és a helyes klinikai gyakorlatra vonatkozó iránymutatás szerint. A vizsgálat részleteit az EU-SE-001 számú jelentésben dokumentálják. A klinikai vizsgálatot a Radi Medical Systems AB „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures” című végső jelentésben dokumentálták. A klinikai vizsgálatot a FemoSeal™ első, #11200-as modelljével végezték, és a beültethető zárókomponensek biztonságosságára és hatásosságára összpontosítottak. Az egyetlen különbség az első #11200 modell és az aktuális C11202 modell között a francia méret, a 6F és a 7F, valamint a továbbfejlesztett bejuttató rendszer között. A klinikai előnyök, a rendeltetésszerű használat, a működtetés alapelvei és a beültethető záróelemek, a belső tömítés és a külső zárókorong nyersanyagai változatlanok maradnak.

Az eszköz használata diagnosztikai szív- vagy intervenciós szívsebészeti beavatkozásokon áteső betegeknél javallott, a combartériát hozzáférési pontként használva. A vizsgálat célja a FemoSeal™ VCS biztonságosságának, Teljesítőképességének és hatékonyságának meghatározása volt. Ez egy prospektív, többközpontú, egykaros, nyílt vizsgálat volt, 30 napos utánkövetéssel.

Az elsődleges teljesítmény végpont a vérzéscsillapításig eltelt idő volt, amelyet a vérzés hiányaként határoztak meg. Az elsődleges biztonsági végpont a jelentős vaszkuláris komplikációk előfordulása volt 30 napig. A másodlagos végpontok között szerepelt az ambulációhoz szükséges idő, a kezelési hibák részaránya, a nemkívánatos események előfordulása és az eszköz teljesítményjellemzői a bejuttatás és a behelyezés során.

A vizsgálatban részt vevő betegek olyan felnőttek voltak, akik tájékozott beleegyezést és legalább egy ép pedálimpulzust tudtak adni. A betegeket kizárták a vizsgálatból, ha a következő állapotok bármelyike fennáll:

- Korábbi perifériás érbetegségek
- Autoimmun betegség
- Ismert súlyos anaemia vérzési zavarai
- INR >1,5
- Miokardiális infarktus 72 órán belül
- A kezelés ellenére kontrollálatlan hipertónia
- Elhízás, amely kizárja a Seldinger technikával való hozzáférést
- Ér-graft vagy sztent jelenléte az arteriotómiás területen
- Korábbi ipsilaterális punkció 3 hónapon belül
- Várható élettartam < 6 hónap

Ezenkívül a betegeket műtét közben megvizsgálták, és kizárták a vizsgálatból, ha az alábbiak bármelyikét megfigyelték:

- A közös combartéria lumenátmérője <5 mm
- Artériás ágak a punkció helyétől 2 cm-re proximálisan
- Jelentős szűkület a punkció helyén belül 3 cm-en belül
- Az elsődleges bevezető katéterhüvely használata >6Fr
- Femorális bifurkációhoz képest disztálisan vagy középen végzett punkció
- Többszörös combi punkció
- Ismert vagy gyanított hátsó combartériás falpunkció
- Nagy hematóma (2:6 cm) az eljárás befejezésekor
- Az eljáráshoz az elsődleges hüvelybehelyezés nehéz a tekervényes szövet vagy ér miatt

Ezt az egyprotokollós vizsgálatot két részben végezték: 20 beteget vontak be az 1. részbe, majd biztonsági elemzést végeztek, majd további 60 beteget vontak be a 2. részbe.

Az 1. részben a bevont betegek átlagos életkora 65,9 év volt, a betegek 70,0%-a férfi volt, a betegek 95%-a pedig egyidejűleg gyógyszeres kezelésben részesült. A vizsgálat 2. részében az átlagos életkor 63,8 év volt, a 78% férfi volt, és 100%-ban egyidejűleg gyógyszeres kezelésben részesült.

A diagnosztikai (1. és 2. rész) vagy intervenciós (2. rész) szívkatóterezési eljárásokon áteső betegek a vizsgálatba bevonhatók voltak. Az eljárások megfeleltek a vizsgálatba bevont kórházak összességében előírt ellátási előírásainak, melyet a FemoSeal™ VCS használata követett. A betegadatokat a kiindulási értéknél, az eljárás során, valamint az 1 napos és 30 napos eljárás után gyűjtötték. Az eredmények az **1.5 táblázatban** vannak összefoglalva, és azt jelzik, hogy a FemoSeal™ VCS biztonságos és hatásos az adott betegpopulációban történő használatra.

**1.5 táblázat: A forgalomba hozatal előtti vizsgálatban jelentett klinikai eredmények**

| Az eszköz hibás működés                                                                                                          | 0 (0%)    | 6 (10%)                |

<sup>a</sup> 58-as teljes mintaméret alapján, mivel 2 beteg nem érte el a vérzéscsillapítást az eljárás idején a korábbi ipsilaterális punkciók miatt. A vérzéscsillapítás ezen betegek esetében 7,37 percig tartott.

<sup>b</sup> 59-es teljes mintaméret alapján: 1 beteget nem vontak be, mivel a tüdőödéma miatt lélegeztetőgépre helyezték, és esetében egy hétnél hosszabb ideig nem volt elérhető az ambuláció.

<sup>c</sup> Meghatározás szerint: vérátömlesztést vagy műtéti korrekciót igénylő érkomplikáció, illetve olyan helyi fertőzés, amely antibiotikum adását, kórházi kezelést vagy kórházi kezelés meghosszabbítását vagy helyi sebtisztítást igényel

A vizsgálat 1. részében nem figyeltek meg nagyobb érrendszeri szövődményeket. A vizsgálat 2. részében 1 nagyobb érrendszeri szövődményről számoltak be: pszeudoaneurizmáról, amelyet a beavatkozást követő egy napon belül jelentettek. Az esemény során ultrahangos vezérlésű kompresszióra és a pszeudoaneurizmába történő trombin befecskendezésére volt szükség, ami tovább hosszabbította a beteg kórházi kezelését.

A vizsgálat 1. részében jelentett 5 nemkívánatos esemény közül 1 valószínűleg az eszközzel kapcsolatos nemkívánatos esemény volt: a beavatkozást követő 1 napon élénk rövid ideig tartó vérzés nem súlyos eseménye. A vizsgálat 2. részében jelentett 19 nemkívánatos esemény közül 3, az eszközzel kapcsolatos, nem-súlyos, hematómával kapcsolatos nemkívánatos eseményt figyeltek meg, valamint 6, az eszközzel kapcsolatos, nem-súlyos eseményt figyeltek meg, beleértve 3 tartós nedvszivárgást, 2 hematómát és 1 testmozgást követő lábfájdalmat.

A 2. részben 3 betegnél értékelték kezelési kudacként a beavatkozást: 2 esetben kompresszió nélkül a vérzéscsillapítás elégtelensége miatt, és 1 esetben súlyos érrendszeri szövődmény (pszeudoaneurizma) miatt. A vizsgálat 1. részében nem fordult elő kezelési kudarc.

A vizsgálat 2. részének hat eszközhibája közül három nem akadályozta az eljárást, az egyik a felhasználói hibára, egy a bevezető szivárgására, egy pedig elszakadt szálizületre vezethető vissza. Az utolsó két problémát a C11202-ben megvalósított modellfrissítésekkel oldottuk meg.

A forgalomba hozatal előtti klinikai vizsgálat 2. része nem jelentett 6 hónapos utánkövetési eredményeket a betegek együttműködésének hiánya miatt. A forgalomba hozatal előtti klinikai vizsgálat (EU-SE-001) 30 napos eredményei, amelyek összhangban vannak a klinikai irodalomban leírt utánkövetési időszakokkal, azt mutatják, hogy a FemoSeal™ VCS biztonságos és hatásos.

## 1.4.2 A forgalomba hozatalt követő klinikai vizsgálatok adatainak összefoglalása

Az alábbi, **1.6 táblázatban** 4 elvégzett, forgalomba hozatal utáni klinikai vizsgálat szerepel. Ezek a klinikai vizsgálat kerültek publikálásra és nem érhetők el online.

**1.6 táblázat: Forgalomba hozatal utáni klinikai vizsgálatok**

| Elvégzett, forgalomba hozatal utáni klinikai vizsgálatok                                    |              |                                                                                |                                                                                                                                                                                                                                                 |                                                                                                                                                                             |                                                                                                                                                             |

|--|--|--|--|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

A 2006-os vizsgálatot azért végezték, hogy megerősítsék a jelenlegi eszköz biztonságát és hatásosságát egy továbbfejlesztett bejuttató rendszerrel, valamint visszajelzést kapjanak a FemoSeal™ VCS használati utasításáról és a képzési programról. A vizsgálatba 100 beteget vontak be, és az elsődleges végpont az volt, hogy elértek-e vérzéscsillapítást, vagy szükség volt-e további manuális vagy mechanikus kompressziókra. Ez a vizsgálat arra a következtetésre jutott, hogy a FemoSeal™ VCS alkalmazása az esetek többségében sikeres volt (91%-ban azonnali vérzéscsillapítást ért el).

A 2008-as vizsgálatba 50 beteget vontak be a FemoSeal™ VCS biztonságosságának és teljesítőképességének felmérésére a 7 Fr-es hüvellyel rendelkező szívkátéterezésein áteső betegeknél szokásos klinikai rutin eljárás során használata során. A vizsgálat elsődleges végpontja az volt, hogy adatokat gyűjtsenek a vérzéscsillapításhoz szükséges időre, valamint az ambulációig eltelt idő további, manuális vagy mechanikus kompresszió nélküli. A vizsgálat eredménye szerint a vérzéscsillapítás átlagos ideje 57,8 másodperc volt, és minden beteg 4 óra elteltével ambulálható volt.

A 2009-es vizsgálat szerint értékelték az új FemoSeal™ VCS csomagolást. A vizsgálatba 25 beteget vontak be. Az elsődleges végpont az volt, hogy a felhasználó tapasztalt-e bármilyen problémát a csomagolással kapcsolatban. A felhasználók nem észleltek problémát az új FemoSeal™ VCS csomagolással kapcsolatban. Ez a vizsgálat a vérzéscsillapításig eltelt időre vonatkozóan is gyűjtött adatokat.

A vizsgálat célja a FemoSeal VCS biztonságosságának és hatásosságának további bizonyítása a közös combartéria (CFA) hozzáférési helyeken végzett vérzéscsillapítás elérése során a perkután endovaszkuláris eljárásokon áteső valós alanyok esetében. A vizsgálatba 230 beteget vontak be. A nyilvántartás elsődleges végpontjai a beavatkozás sikeressége (azaz sikeres punkció a vérzés miatt), valamint a súlyos szövődmények (pl. érsérülés, a behatolási hellyel kapcsolatos vérzés, a behatolási hely fertőzése, ismételt manuális kompresszió és új, műtéti helyekkel kapcsolatos ipsilaterális akut lábi ischaemia) csökkenése. A vizsgálat arra a következtetésre jutott, hogy a FemoSeal™ VCS jól teljesít valós körülmények között, és hatékony vérzéscsillapítást és alacsony hozzáférési helyi szövődményarányt biztosít a perifériás endovaszkuláris beavatkozásokon áteső betegek számára. Jó teljesítményt mutat rövid vérzéscsillapítási idővel és jó kezelői visszajelzéssel, ami a FemoSeal™ VCS-t értékes eszközzé teszi a femorális hozzáférés lezárásához.

### **1.4.3 A forgalomba hozatalt követő klinikai vizsgálatok adatainak összefoglalása**

#### **1.4.3.1 Elvégzett, forgalomba hozatal utáni nyomonkövetés**

Az elvégzett forgalomba hozatalt követő klinikai utánkövetési tevékenységek összefoglalása az alábbi **1.7 táblázatban** található.

### 1.7 táblázat: Forgalomba hozatal utáni klinikai utánpótlási tevékenységek

| Elvégzett, forgalomba hozatal utáni klinikai utámkövetési tevékenységek |  |  |  |  |                                                                                                                                                                                                              |
|-------------------------------------------------------------------------|--|--|--|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                         |  |  |  |  | valószínűleg nem volt megfelelő, mert olyan merev vezetődrtöt használtak (Boston Scientific Amplatz Super Stiff, 75 cm, 0,035 hüvelyk), amely manuális kompressziót igényelt a vérzéscsillapítás eléréséhez. |

A Terumo Medical Corporation három magas színvonalú orvosfelhasználói felmérést végzett a jelenlegi jelentési időszakban (2019. szeptember 1. – 2024. augusztus 31.).

A FemoSeal™ klinikai vizsgálatok proaktív klinikai adatokat gyűjtöttek a FemoSeal™ VCS biztonságosságával és teljesítményével kapcsolatban a klinikai használat során. A felmérésben olyan kérdések merültek fel, amelyek a teljes eszközre és a kapcsolódó tartozékokra összpontosítottak, beleértve a 0,038"-os vezetődrtöt és közvetlen interakcióikat. A Guidewire klinikai vizsgálatok a FemoSeal™ VCS-hez mellékelt 0,038"-os vezetődrt klinikai használata során a biztonságosságra és a teljesítményre vonatkozóan proaktív klinikai adatokat gyűjtöttek. A felmérés a vezetődrt általános használatára összpontosított, a behelyezéstől az bevezetőhüvelyen át az érrendszerbe történő bevezetésig és a drót eltávolításáig.

Az eszökhöz mellékelt FemoSeal™ VCS és 0,038" vezetődrt megkapta az összes elfogadható minősítést és hat (6) panaszt az eszközre vonatkozóan, valamint kilenc (9) nem panasz-jellegű bejelentés a vezetődrtre vonatkozóan a kiváló minőségű klinikai vizsgálatokból származó megjegyzések értékelése alapján. A panaszokat mind a FemoSeal, mind a vezetődrt tekintetében értékelték, és a Terumo forgalomba hozatal utáni felügyeleti folyamatának részeként értékelték. Nem azonosítottak új kockázatokat és kockázati szinteket.

A PMCF-tevékenységek keretében 2024-ben orvosi felhasználói felmérést végeztek. A felmérés eredményei azt mutatták, hogy a FemoSeal™ VCS teljesítményértékelése és biztonságossága általánosságban nagyon kedvező volt. A FemoSeal™ VCS-hez a mellékelt szabványos vezetődrttől eltérő más vezetődrtök kompatibilitását is bizonyították.

#### **1.4.3.2 Folyamatban lévő vagy tervezett, forgalomba hozatalt követő klinikai utánpótlás**

A TMC egy folyamatos/tervezett forgalomba hozatal utáni klinikai utánpótlási tevékenységet folytat. Sor kerül egy klinikai felmérésre, amely a vezetődrótnak az EU piacán forgalmazott FemoSeal VCS rendszer használatával kapcsolatos visszajelzések gyűjti össze utólagosan. A vizsgálatot az orvosok végzik el annak vizsgálatára, hogy milyen vezetődrótokat használtak a beavatkozás során. A kérdőív célja egy olyan hiányosság kezelése, amely a FemoSeal™ VCS-nek más, nem Terumo gyártmányú vezetődrótokkal való kompatibilitásáról szóló szakirodalom és külső szakértői vélemények hiányából adódik. A visszajelzés magában foglalja a technikai eredményeket, a klinikai teljesítményt és az eszköz különböző vezetődrótokkal való teljesítőképességére vonatkozó biztonságosságot.

#### **1.4.4 A szisztematikus szakirodalmi áttekintésből származó adatok összefoglalása**

A Terumo Medical Corporation szisztematikus szakirodalmi felülvizsgálatot végez a FemoSeal™ VCS és/vagy a hasonló eszközökkel kapcsolatban közzétett vizsgálatokból származó klinikai biztonságossági és teljesítményadatok összegyűjtésére és értékelésére. A publikált szakirodalom éves szűrésének célja a korábban ismeretlen mellékhatások azonosítása, az ismert mellékhatások nyomon követése, a veszélyes kockázatok azonosítása, valamint az FemoSeal™ VCS lehetséges szisztematikus helytelen használata vagy rendeltetéstől eltérő használata.

A legutóbbi szisztematikus szakirodalom-felülvizsgálat, amely 2019. szeptember 1-től 2024. augusztus 31-ig tartó időszakra terjedt ki, 29 publikált vizsgálatot azonosított, amelyek klinikai biztonságossági és teljesítményadatokat szolgáltatnak az FemoSeal™ VCS-mel kapcsolatban. Huszonhárom referencia publikáció számolt be a FemoSeal™ VCS rendeltetésnek megfelelő és kilenc a rendeltetésen kívüli használatáról. Összességében a FemoSeal™ VCS használatára vonatkozó vizsgálatok szakirodalmi felülvizsgálata egy olyan vizsgálat alatti populációt mutat be, amely az EU-ban lévő, perkután érkatéterezési eljárásos áteső betegek egy reprezentatív populációja. Ezen 23, a rendeltetésnek megfelelő használatról beszámoló szakirodalmi publikációt lásd a **3. szakaszban**.

A klinikai teljesítőképességet a következő mérőszámok alapján értékelték:

- A vérzéscsillapításhoz szükséges idő jobb vagy hasonló a perkután végzett közös combaréria elzárás legkorszerűbb módszerével elért időhöz.
- Az ambulációhoz szükséges idő jobb, jobb vagy hasonló a perkután végzett közös combaréria elzárás legkorszerűbb módszerével elért ambulációs idő.
- A posztoperatív szövődmények aránya hasonló vagy alacsonyabb mint a jelenlegi standard kezelésnél megfigyelték.

Ezen klinikai teljesítőképesség mérések alapján a szakirodalomban szereplő adatok azt mutatták, hogy a FemoSeal™ VCS sikeresen használható a combartéria-punkció (arteriotomia) lezárására olyan betegeknél, akik 7 Fr vagy kisebb méretű bevezetőhüvelyt használva perkután katéterezéssel estek át. Az esetek többségében (79,65–100%) teljes vérzéscsillapítást értek el, és a vérzéscsillapításig eltelt átlagos idő 0,5 perc volt, az átlagos elbocsátási idő pedig 3 nap. A betegek 69,2–86,7%-a képes volt 5 órával a lezárás után járni, a műtét utáni átlagos fekvési idő 349 perc volt. A FemoSeal™ VCS elégtelenségét az esetek 3,68-4%-ában figyelték meg, és további manuális kompresszióra az eljárások 0,9–4,4%-ában volt szükség.

A klinikai biztonságosságot többek között az alábbi nemkívánatos események alapján értékelték:

- Vérzés
- Hematóma
- Pszeudoaneurizma
- Véraláfutás
- Arteriovenózus fisztula
- Fertőzés
- Halál

Az említett nemkívánatos események mindegyikénél a mellékelt vizsgálatokban a FemoSeal™ VCS alkalmazásával kapcsolatban jelentett előfordulási arány kisebb volt, vagy összevethető volt a manuális kompressziós és egyéb érlezáró eszközöknél tapasztalt arányokkal.

A 10 esettanulmány áttekintésével nem azonosítottunk nemkívánatos eseményt, mivel nem azonosítottunk új, nem várt, újonnan kialakuló vagy elfogadhatatlan kockázatokat.

A FemoSeal™ VCS diagnosztikai angiográfia vagy intervenciós műtét során történő használatának általános hatékonysága több tényezőtől függ, például: nemtől, életkortól, a beteg anatómiájától, társbetegségektől, a punkció helyének anatómiai elhelyezése, a sebész tapasztalata, a VCD behelyezési módszere, posztoperatív gondozás, stb. A technikai siker mellett, beleértve a vérzéscsillapítás elérését is, a FemoSeal™ VCS klinikai előnyöket kínált az érlezáráshoz képest a combartéria punkciója után, például a vérzéscsillapításig eltelt idő lerövidülését, az ambulációig eltelt idő lerövidülését. A FemoSeal™ VCS teljesítményeredményei megfelelnek az ilyen típusú eszközzel szembeni elvárásoknak, ha rendeltetésszerűen használják. A jelenlegi keresési időszak alatt lekért hivatkozások némelyike a szóban forgó eszközt a közös femorális artériától eltérő anatómiai helyen, valamint > 7 Fr arteriotómiák lezárására alkalmazta, ami nem indikáció szerinti alkalmazásnak minősül.

A felülvizsgálat során nem azonosítottak ismeretlen mellékhatásokat, felmerülő kockázatokat vagy az eszköz lehetséges szisztematikus helytelen használatát. Ha azonban a FemoSeal™ VCS-t képzett orvosok óvatosan használják, az orvostechnikai eszköz hasznos és szükséges klinikai

eszközként működik. Összességében a célterápia és így a FemoSeal™ VCS megfelel az érhozzáféréssel kapcsolatos szövödmények kezelésében jelenleg fennálló klinikai igényeknek.

Összességében a szakirodalomban szereplő adatok nem azonosítottak olyan teljesítmény- vagy biztonsági problémákat a klinikai környezetben, amelyek korábban ismeretlenek voltak, vagy a nemkívánatos hatások a várt/elfogadhatónál nagyobb arányban fordultak elő. Ezért ebből az irodalmi áttekintésből az a következtetés vonható le, hogy a FemoSeal™ VCS, ha a perkután katéterezést követően az arteriotómiában a hemosztázishoz kompresszió biztosítóra használják, továbbra is a várt módon működik, és nem jár komoly biztonsági eseményekkel.

#### **1.4.5 A forgalomba hozatalt követő klinikai vizsgálatok adatainak összefoglalása**

Megelőző PMS rendszer van érvényben, és minden panaszt havonta, a belső gyártási eljárásoknak megfelelően felülvizsgálunk. A reklamációs adatok elemzése a 2019. szeptember 1. és 2024. augusztus 31. közötti időszakokban történt. Összességében 28 orvosi eszköz figyelő (MDV) jelentés és 476 ügyfélpanasz-jelentés érkezett a gyártóhoz. A 28 MDV-jelentésből 27 nemkívánatos eseménnyel, egy pedig az eszköz meghibásodásával volt kapcsolatos. A jelentési időszak alatt két haláleset történt, de mindkét esetben úgy ítélték meg, hogy az esemény nem áll összefüggésben vizsgált eszközzel. A gyártónál benyújtott 476 panasz közül a leggyakoribb ok a bevezetési nehézségek voltak (146 előfordulás, 0,0142% előfordulási arány). A kihúzási események meghibásodási módja a második leggyakrabban előforduló, 0,0126%-os arányban (130 esemény).

A FemoSeal Vascular Closure System világszerte több mint 1 030 136, az Európai Gazdasági térségben pedig 827 843 értékesítést ért el. A panaszoknak a globális értékesítések alapján számított gyakorisága 0,046%. Az összesített ügyfélpanaszok aránya nagyon alacsony. Nem azonosítottak olyan új kockázatokat, amelyek nem szerepelnek a használati utasításban és a kockázati dokumentációban.

A mellékhatások előfordulási arányát az **1.2 táblázat** tartalmazza. A panaszok által nem azonosítottak új előre nem látható, felmerülő vagy elfogadhatatlan kockázatokat. Az ismert nemkívánatos mellékhatások gyakorisága vagy súlyossága nem emelkedett jelentősen.

#### **1.4.6 A klinikai teljesítmény és biztonság általános összefoglalása**

A FemoSeal™ VCS használata a közös combartéria-punkció (arteriotomia) lezárására javallt olyan betegeknél, akik 7F (2,33 mm) vagy kisebb bevezetőhüvely segítségével perkután katéterezésen estek át. Ez a klinikai értékelés a FemoSeal™ VCS rendeltetésszerű használatára vonatkozó, rendelkezésre álló forgalomba hozatal előtti és utáni klinikai adatok és szakirodalom átfogó elemzésén alapul.

A publikált szakirodalom átfogó áttekintését 2019. szeptember 1-től 2024. augusztus 31-ig végezték. A bizonyítékok 29, a FemoSeal™ VCS-re vonatkozó vizsgálatot foglaltak magukban.

A klinikai értékelés során rendelkezésre bocsátott bizonyítékok arra a következtetésre jutottak, hogy nevezett eszköz a javallatoknak megfelelően használva biztonságos és hatásos, és az eszközzel normál használati körülmények között összefüggő kockázatok vagy nemkívánatos mellékhatások elfogadható kockázatnak minősülnek a beteg számára nyújtott előnyökkel szemben. A nevezett eszközök teljesítményeredményei megfelelnek az ilyen típusú eszközzel szembeni elvárásoknak, ha rendeltetésszerűen használják.

A FemoSeal™ VCS használatával kapcsolatos lehetséges nemkívánatos mellékhatások közé tartoznak az arteriotómiás lezárás alternatív eszközeivel gyakran jelentett nemkívánatos események, például a vérzés és a hematóma. Összességében a FemoSeal™ VCS használatával kapcsolatosan jelentett nemkívánatos események előfordulási arányai megegyeznek a manuális kompressziós és hasonló érlezáró eszközökkel jelentett arányokkal. Pontosabban, a vérzés és a hematóma esetében a FemoSeal™ VCS esetében jelentett arányok alacsonyabbak, mint a hasonló érlezáró eszközök esetében jelentett arányok. A közölt irodalomból és a forgalomba hozatal utáni felügyeletből eredő minden egyes nemkívánatos eseményt előzőleg azonosítottak (lásd az **1.3 szakaszt**).

A klinikai biztonságosságra és teljesítményre vonatkozó meglévő adatok azt sugallják, hogy a beteg számára az érlezáró eszköz használata nyújtotta előnyök meghaladják a lehetséges kockázatokat, ha az eszközt a Használati utasításnak megfelelően használják.

Amint azt fentebb már említettük, a FemoSeal™ VCS-hez megadott adatok megmutatják, hogy a vizsgált eszközzel kapcsolatos adatok (pl. eszközhasználat, biztonságossági eredmények, klinikai teljesítmény és klinikai előnyök) konzisztensek az azonosított ekvivalens eszközök és a legkorszerűbb hasonló eszközökkel kapcsolatos adatokkal

A biztonsági adatok keresztelemzése nem talált hiányosságokat a következők között:

- A jelenlegi szakirodalomban említett adatok
- Az eszközre vonatkozó adatok kiértékelés alatt
- Az eszközre vonatkozó adat(ok) kiértékelés alatt
- A címkeszövegben és/vagy a használati utasításban említett adatok (vagyis a fennmaradó kockázatok, amelyeket a felhasználóval ismertetni kell).

A klinikai biztonságosságot a publikált klinikai szakirodalomban, a vállalat által szponzorált klinikai vizsgálatokban, a forgalomba hozatal utáni adatok áttekintésében azonosított szövődmények alacsony aránya, valamint a forgalomból való kivonások hiánya igazolja. A teljesítménnyel kapcsolatos aggályokat nem azonosították, az áttekintett szakirodalom tartalmazta a FemoSeal™ VCS a gyártó által meghatározott rendeltetésének megfelelő használatát.

## 1.5 Lehetséges diagnosztikai vagy terápiás alternatívák

Hagyományosan manuális kompresszió használatos a vérzéscsillapítás érkatéterezést követő elérésére az arteriotómiás területen. A manuális kompresszióhoz a beteg hosszú (az eljárás után legfeljebb 8 órán keresztül tartó) immobilizációja társul jelentős diszkomfortérzéssel és elhúzódó kórházi tartózkodással. Egy nemrégiben végzett szisztematikus felülvizsgálat megállapította, hogy a manuális kompresszióval végzett vérzéscsillapítás eléréséhez szükséges medián idő 20,8 perc.<sup>1</sup>

A manuális kompresszió alternatívái közé tartoznak a külső vérzéscsillapító eszközök, amelyek mechanikai kompressziót alkalmaznak az arteriotómiás területen. Ezek az eszközök nem rövidítik le a vérzéscsillapításhoz vagy az ambulációhoz szükséges időt, viszont a manuális kompresszió mechanikus kompresszióval történő helyettesítésével csökkentik a személyzettel szemben támasztott követelményeket. A mechanikus kompresszió alkalmazásával kapcsolatos nemkívánatos események arányai hasonlóak a manuális kompresszió esetében tapasztaltakhoz.

Az érlezáró eszközök, mint például a FemoSeal™ VCS, az arteriotómiás lezárására szolgálnak. Céljuk, hogy csökkentsék a vérzéscsillapításhoz szükséges időt, és lehetővé tegyék a korábbi ambulációt. A közelmúltban végzett szisztematikus felülvizsgálat, mely magában foglalta a 13 kereskedelmi forgalomban kapható eszköz értékelését, megállapította, hogy a vérzéscsillapítás érlezáró eszközzel történő eléréséhez szükséges medián idő 5,4 perc volt. Az egyes érlezáró eszközök medián vérzéscsillapítási ideje 1 perc (FemoSeal™ VCS) és 14 perc között volt; az eszközök többségének esetében 4–10 perc között.<sup>1</sup>

Az arteriotómiás terület lezárásával összefüggő, gyakran jelentett nemkívánatos események, manuális kompresszió, külső vérzéscsillapító eszközök és az érlezáró eszközök alkalmazásával, magukban foglalták a haematómát, a hozzáférési helyen fellépő vérzést, a pseudoaneurizmát, az arteriovenosus fistulát és a fertőzést. Ugyanez a szisztematikus felülvizsgálat (34 randomizált, kontrollált vizsgálat, 14 401 beteg) megállapította, hogy a nemkívánatos események aránya hasonló volt a manuális kompresszió és az érlezáró eszközök használata között, kivéve, hogy az érlezáró eszközök esetében erősebb vérzési tendenciák mutatkoztak.<sup>1</sup>

## 1.6 Javasolt felhasználói profil és képzés

A FemoSeal™ Vascular Closure System tervezett felhasználói azok az orvosok, akik a közös combartérián keresztül képesek elvégezni az artériás hozzáférést és az endovaszkuláris eljárások lezárását, és részt vettek a Terumo Medical Corporation FemoSeal™ orvosoknak szóló oktatásán.

### 1.7 Vonatkozó harmonizált és általános szabványok

Questo Riepilogo delle prestazioni cliniche e di sicurezza (SSCP) ha lo scopo di consentire al pubblico di accedere a un riepilogo aggiornato dei principali aspetti della sicurezza e delle prestazioni cliniche di FemoSeal™ Vascular Closure System (VCS).

Di seguito, nella **Sezione 1.0**, è riportato un riepilogo delle prestazioni cliniche e di sicurezza del dispositivo, destinato agli utenti/operatori sanitari.

## **1.0 RIEPILOGO PER UTENTI/OPERATORI SANITARI**

L'SSCP non intende sostituire le Istruzioni per l'uso, che rappresentano il documento principale per garantire un uso sicuro del dispositivo, né fornire agli utenti o ai pazienti suggerimenti diagnostici o terapeutici. L'SSCP non intende sostituire le informazioni obbligatorie riportate sulle schede di impianto o in qualsiasi altro documento obbligatorio.

### **1.1 Uso previsto del dispositivo**

#### **1.1.1 Uso previsto**

FemoSeal™ Vascular Closure System è un dispositivo medico indicato per la chiusura di una puntura arteriosa dopo cateterizzazione percutanea attraverso l'arteria femorale comune.

#### **1.1.2 Indicazioni d'uso**

FemoSeal™ Vascular Closure System è indicato per l'uso nella chiusura della puntura dell'arteria femorale comune (arteriotomia) in pazienti sottoposti a cateterizzazione percutanea con introduttore procedurale pari o inferiore a 2,33 mm (7 F).

#### **1.1.3 Controindicazioni e/o limitazioni**

FemoSeal™ Vascular Closure System è controindicato nei pazienti con arteriotomie in cui sono stati utilizzati introduttori o dispositivi più grandi di 2,33 mm (7 F).

#### **1.1.4 Categorie di pazienti target**

La sicurezza e l'efficacia di FemoSeal™ Vascular Closure System sono state stabilite in pazienti di età pari o superiore a 18 anni che sono stati sottoposti a cateterizzazione percutanea utilizzando un introduttore procedurale di dimensioni pari o inferiori a 2,33 mm (7F).

#### **1.1.5 Categorie specifiche di pazienti**

La sicurezza e l'efficacia di FemoSeal™ Vascular Closure System non sono state dimostrate nelle seguenti categorie di pazienti:

- Pazienti con malattia autoimmune preesistente.
- Pazienti sottoposti a trombolisi terapeutica.
- Pazienti con malattia vascolare periferica clinicamente significativa.
- Pazienti con ipertensione non controllata (> 220 mmHg sistolica o > 110 mmHg diastolica).
- Pazienti con disturbi della coagulazione, tra cui trombocitopenia (< 100.000 piastrine) o anemia (Hgb < 10 mg/dl).
- Pazienti con lume interno dell'arteria femorale comune inferiore a 5 mm.

- Pazienti con compromissione renale e/o epatica.
- Pazienti con altra comorbidità rilevante.
- Pazienti con origini razziali e/o etniche specifiche.
- Pazienti con infarto del miocardio entro 72 ore.
- Pazienti con innesto o stent vascolare nel sito di venipuntura.
- Pazienti in gravidanza o in allattamento.
- Pazienti di età inferiore a 18 anni.

### 1.1.6 Utilizzatori previsti

Gli utilizzatori previsti di FemoSeal™ Vascular Closure System sono medici con una formazione che li abilita a eseguire accessi e chiusure arteriose per procedure endovascolari attraverso l'arteria femorale comune e che hanno partecipato a un programma di formazione per medici FemoSeal™ di Terumo Medical Corporation.

## 1.2 Descrizione del dispositivo

### 1.2.1 Descrizione del dispositivo

FemoSeal™ Vascular Closure System, prodotto da Terumo Medical Corporation (TMC), è un dispositivo di chiusura vascolare riassorbibile progettato per ottenere l'emostasi dell'arteria femorale dopo la cateterizzazione percutanea attraverso l'arteria femorale comune.

Gli elementi di chiusura FemoSeal™ sono costituiti da due dischi polimerici riassorbibili, un disco sigillante interno e un disco di bloccaggio esterno, che sono tenuti insieme da un multifilamento riassorbibile, che chiude meccanicamente l'arteriotomia (vedere **Figura 1.1** e **Figura 1.2**). Dopo essere stato posizionato attraverso l'introduttore con alloggiamento a cono, il disco di bloccaggio esterno viene compresso sullo shaft multifilamento, con conseguente chiusura meccanica del sito di venipuntura tra il disco di bloccaggio interno e quello esterno. Il disco sigillante interno e il disco di bloccaggio esterno sono tenuti in posizione grazie all'attrito sullo shaft multifilamento. L'emostasi si ottiene con mezzi meccanici. Gli elementi di chiusura si degradano per idrolisi.

I componenti della chiusura impiantabile, il disco di sigillo interno e il disco di bloccaggio esterno, si degradano in diciotto (18) mesi, mentre si stima che il multifilamento si degradi e venga assorbito per idrolisi dai tessuti circostanti dopo due (2) o tre (3) anni. La capacità dei componenti di chiusura impiantabili di mantenere la compressione sull'arteriotomia è stata testata fino a otto (8) ore. I prodotti della degradazione vengono metabolizzati ed espulsi nell'urina o espirati come

anidride carbonica attraverso i polmoni. Negli studi sugli animali non sono stati osservati effetti da accumulo. I componenti aggiuntivi di FemoSeal™ che entreranno in contatto con tessuti viventi o sangue durante la procedura sono l'introduttore con alloggiamento a cono, il dilatatore, il tubo di compattazione, lo spintore e il filo guida.

**Figura 1.1 Disco sigillante interno e disco di bloccaggio esterno rispettivamente**

**Figura 1.2 Disco sigillante interno e disco di bloccaggio esterno posizionati**

L'unità FemoSeal™ è fornita insieme a un dilatatore e a un filo guida con diametro esterno di 0,97 mm (0,038") e lunghezza di 70 cm (27,5") e un raddrizzatore a J; vedere la **Figura 1.3** di seguito. È contenuto in un tubo di polietilene. Tutte le parti sono confezionate in un vassoio di carta fisso. La confezione include anche la scheda di impianto del paziente. FemoSeal™ Vascular Closure System non richiede accessori aggiuntivi per il funzionamento previsto del dispositivo, che deve essere utilizzato solo con il dilatatore e il filo guida inclusi nella confezione originale.

**Figura 1.3 Unità FemoSeal™ VCS con filo guida e dilatatore**

### 1.2.2 Materie prime e componenti

La **Tabella 1.1** riportata di seguito elenca i componenti di FemoSeal™ VCS.

**Tabella 1.1 Materie prime e componenti di FemoSeal™ VCS**

\* Parte impiantabile del dispositivo; i componenti impiantabili sono compatibili con la RM

FemoSeal™ VCS è sterilizzato con ossido di etilene (EtO) ed è un dispositivo medico monouso. È pertanto progettato in modo tale da non poter essere riutilizzato.

### **Modalità di azione**

FemoSeal™ VCS favorisce l'emostasi meccanica mediante il posizionamento di elementi di chiusura impiantabili all'interno e all'esterno dell'arteria femorale comune. Il meccanismo che previene l'emorragia è fornito dal sigillo interno che chiude il sito di venipuntura e dal disco di bloccaggio esterno che mantiene in posizione il sigillo interno.

### 1.2.3 Benefici clinici

FemoSeal™ VCS offre i seguenti benefici clinici rispetto alla chiusura vascolare dopo una puntura dell'arteria femorale comune:

- Riduzione del tempo di emostasi<sup>1</sup>
- Riduzione del tempo per la deambulazione<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### 1.2.4 Generazioni o varianti precedenti

- La prima versione di FemoSeal™ VCS (n. 11200) è stata venduta sul mercato europeo nel 2005 e parte del 2006.
- L'attuale FemoSeal™ VCS (n. 11202), con un sistema di infusione migliorato, è sul mercato dal 28 marzo 2006.

### 1.2.5 Accessori destinati all'uso in combinazione con il dispositivo

L'unità FemoSeal™ è fornita insieme a un dilatatore, un filo guida con diametro esterno di 0,97 mm (0,038"), lunghezza di 70 cm (27,5") e un raddrizzatore a J. Il filo guida è un accessorio dell'unità FemoSeal™. Il raddrizzatore a J è un componente del filo guida, mentre il dilatatore è un componente dell'unità FemoSeal™. Il filo guida è l'unico accessorio considerato. È contenuto in un tubo di polietilene. Tutte le parti sono confezionate in un vassoio di carta fisso. La confezione include anche la scheda di impianto del paziente. FemoSeal™ Vascular Closure System non richiede accessori aggiuntivi per il funzionamento previsto del dispositivo, che deve essere utilizzato solo con il dilatatore e il filo guida inclusi nella confezione originale.

### 1.2.6 Altri dispositivi e prodotti destinati a essere utilizzati in combinazione con il dispositivo

FemoSeal™ VCS non richiede ulteriori dispositivi per funzionare come previsto.

## 1.3 Rischi e avvertenze

### 1.3.1 Rischi residui ed effetti indesiderati

Gli eventi avversi noti o prevedibili, i danni e le complicanze associati all'uso del FemoSeal™ VCS come risultato del rischio residuo sono elencati nella **Tabella 1.2**. Il tasso di occorrenza si basa sull'analisi della documentazione del rischio e viene calcolato sulla base dei dati di monitoraggio post-commercializzazione dal 1° settembre 2019 al 31 agosto 2024. Non vi sono

rischi residui sconosciuti per FemoSeal™ VCS e tutti i rischi applicabili sono stati affrontati attraverso le Istruzioni per l'uso e il processo di gestione del rischio.

**Tabella 1.2. Eventi avversi/complicanze dei FemoSeal**

### 1.3.2 Avvertenze e precauzioni

#### Avvertenze

1. Non utilizzare se la confezione è danneggiata o se la barriera sterile non è intatta.
2. Non utilizzare dopo la data di scadenza: le prestazioni dei componenti biodegradabili potrebbero essere insufficienti.
3. Non utilizzare in caso di elementi che appaiono danneggiati o difettosi.
4. L'uso di FemoSeal™ Vascular Closure System in caso di contaminazione batterica dell'introduttore procedurale o del tessuto circostante può causare infezioni.
5. Se si sospetta che la parete dell'arteria posteriore sia stata perforata o che sia stata eseguita più di una puntura arteriosa, non affidarsi esclusivamente a FemoSeal™ Vascular Closure System per ottenere l'emostasi arteriosa. Utilizzare una compressione manuale o meccanica aggiuntiva.
6. Se il sito di venipuntura si trova in corrispondenza o in posizione distale rispetto alla biforcazione dell'arteria femorale, non utilizzare FemoSeal™ Vascular Closure System a causa del rischio di posizionamento errato del sigillo interno. Questo evento può causare complicazioni emorragiche e/o l'interruzione della normale portata di sangue.
7. In caso di emorragia arteriosa persistente dal sito di incisione, non tagliare il multifilamento fino al raggiungimento dell'emostasi. Se non si ottiene l'emostasi, fissare il multifilamento con una medicazione sterile e applicare una compressione supplementare fino a raggiungerla. In caso di emorragia arteriosa persistente, possono verificarsi complicanze emorragiche significative che possono causare lesioni o decesso del paziente.
8. Non utilizzare FemoSeal™ Vascular Closure System se il sito di venipuntura è vicino al legamento inguinale, in quanto potrebbe verificarsi un ematoma retroperitoneale.
9. I soggetti ad alto rischio di emorragia possono soffrire di una maggiore perdita di sangue, che richiede una trasfusione.
10. Se il disco interno si stacca può potenzialmente causare un evento trombotico e/o embolico.

#### Precauzioni

1. La procedura di posizionamento di FemoSeal™ Vascular Closure System deve essere eseguita da medici con un'adeguata formazione sull'uso del dispositivo.
2. Prima di posizionare FemoSeal™ Vascular Closure System, eseguire un angiogramma femorale limitato o una puntura femorale ecoguidata.

3. Interrompere la procedura in caso di:
  - Diametro del lume dell'arteria femorale comune < 5 mm.
  - Stenosi e/o placca significativa presente in prossimità del sito di venipuntura dell'arteria femorale comune.
  - La puntura dell'arteria avviene in corrispondenza o in posizione distale rispetto alla biforcazione dell'arteria femorale.
  - Rami anomali o alterazioni dei vasi presenti in prossimità del sito di venipuntura dell'arteria femorale comune.
4. In presenza di ematomi, prestare particolare attenzione al corretto inserimento dell'introduttore con alloggiamento a cono nell'arteria.
5. Utilizzare una tecnica di venipuntura in una sola parete. Non perforare la parete posteriore dell'arteria.
6. Adottare sempre una tecnica sterile quando si utilizza FemoSeal™ Vascular Closure System.
7. FemoSeal™ Vascular Closure System è un prodotto monouso e non deve essere risterilizzato o riutilizzato. L'unità FemoSeal™ è progettata in modo tale da non poter essere riutilizzata.
8. Se il posizionamento del sigillo interno incontra una resistenza inaspettata, interrompere la procedura.
9. Per un corretto posizionamento del sigillo interno, riposizionare il pollice in modo che il pulsante possa scattare liberamente.
10. Assicurarsi che la punta dell'introduttore con alloggiamento a cono dell'unità FemoSeal™ sia sotto la superficie cutanea prima di posizionare il disco di bloccaggio esterno. Il disco di bloccaggio esterno può essere inavvertitamente posizionato al di sopra del livello della cute in pazienti con una distanza ridotta tra l'arteria femorale e il livello della cute.
11. Per un corretto posizionamento, può essere necessaria un'incisione cutanea prima del posizionamento.
12. Se il sigillo interno è all'interno dell'arteria, ma non è possibile premere completamente il pulsante e posizionare il disco di bloccaggio esterno, può essere necessario un intervento chirurgico per rimuovere gli elementi di chiusura FemoSeal™.
13. Nel caso in cui si debba ripungere la stessa arteria femorale entro 18 mesi, pungere a 1 cm prossimale rispetto al precedente sito di accesso del FemoSeal™ Vascular Closure System.

14. Indicare al paziente di seguire le indicazioni del medico riguardo all'ispezione del sito di chiusura

15. e di portare con sé la Scheda informativa per il paziente per i 18 mesi successivi

### **Precauzioni al momento della dimissione**

Prima della dimissione, valutare le seguenti condizioni cliniche del paziente:

1. Emorragia e/o ematoma nel sito di chiusura.
2. Dolore alla deambulazione.
3. Segni di infezione nel sito di chiusura.

### **1.3.3 Procedure correttive di sicurezza sul campo**

È stata intrapresa una procedura correttiva di sicurezza sul campo riguardante FemoSeal™ VCS durante il periodo compreso tra il 1° settembre 2019 e il 31 agosto 2024.

Nel 2022, Terumo ha richiamato volontariamente FemoSeal™ VCS a causa di reclami che sostenevano l'insuccesso dei test di processo e di rilascio dei lotti del prodotto FemoSeal fabbricato a Elkton per la misurazione della forza di compressione e della forza di retrazione. In totale sono stati richiamati 950 unità dalla Corea del Sud.

## **1.4 Valutazione clinica e follow-up clinico post-vendita**

La **Tabella 1.3** include un elenco di studi cardine per la commercializzazione di FemoSeal™ VCS, nonché studi post-commercializzazione e attività di follow-up clinico post-commercializzazione. La versione del dispositivo utilizzata nello studio è inclusa nella tabella seguente. La prima versione di FemoSeal™ VCS (n. 11200) è stata lanciata sul mercato fino al 2006, mentre la versione successiva (n. C11202) è stata lanciata sul mercato nel 2006 ed è quella attualmente in commercio.

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Eseguito da Biomatech, Francia | Studio sugli animali | Lo scopo dello studio era valutare la biocompatibilità e la biofunzionalità di un impianto biodegradabile progettato per ottenere l'emostasi nel sistema vascolare. Il dispositivo testato è stato progettato per penetrare nel foro di puntura delle arterie per ottenere l'emostasi. Un disco è stato inserito nel foro di puntura nell'arteria e l'altro ha chiuso il disco interno dall'esterno dell'arteria. Entrambi i dischi sono stati inseriti attraverso un kit introduttore. I dischi sono | Periodo di impianto/follow-up di 5 settimane per tutti gli animali<br><br>4 pecore, 1 maiale<br><br>14 elementi di chiusura<br><br>8 elementi di chiusura impiantati in 2 pecore<br><br>2 elementi di chiusura impiantati in 1 maiale<br><br>Quando due elementi di chiusura sono stati impiantati nella stessa | Sono stati registrati vari segni avversi (infiammazione, necrosi, emorragia o altre lesioni) o la formazione di un sottile strato pseudo-intimale. Particolare attenzione è stata dedicata all'integrazione tissutale iniziale del dispositivo, con particolare riguardo all'incapsulamento interno del disco.<br><br>Macroscopicamente, non sono stati osservati segni significativi di intolleranza locale o formazione di trombi. L'osservazione                                                                                                                                                                                                                                                                                                                                                          |

|  |  |  | <p>stati progettati per prevenire l'emorragia, per cicatrizzare la parete del vaso e infine per degradarsi ed essere assorbiti. Lo studio è stato progettato per raccogliere e analizzare i dati dopo l'impianto funzionale nella pecora e nel maiale per valutare la capacità dell'impianto di mantenere la funzione fisiologica quando viene utilizzato nel sistema circolatorio, per determinare la risposta dell'ospite e del dispositivo (integrità fisica, incapsulamento tissutale al momento del sacrificio) e per valutare la degradazione dell'impianto</p> | <p>arteria femorale, la distanza di impianto era &gt; 30 mm</p> | <p>macroscopica non ha rivelato alcuna differenza tra pecora e maiale dopo l'impianto degli elementi di chiusura nelle arterie femorali. Macroscopicamente, non sono stati osservati segni significativi di intolleranza locale o formazione di trombi. L'osservazione macroscopica non ha rivelato alcuna differenza tra pecora e maiale dopo l'impianto degli elementi di chiusura nelle arterie femorali.</p> <p>L'analisi istopatologica del sito di impianto nelle pecore non ha evidenziato reazioni avverse locali. I dischi interni ed esterni mostravano segni di degrado e in alcuni casi erano rotti in parti più piccole. I dischi interni erano completamente integrati nel tessuto neointimale. Nel maiale l'analisi istopatologica ha mostrato un numero leggermente maggiore di segni infiammatori intorno ai dischi interni ed esterni. In entrambi gli animali, il multifilamento ha mostrato segni infiammatori leggermente superiori rispetto al materiale del disco, come è normale per le suture intrecciate a causa della maggiore superficie.</p> <p>La pervietà del vaso è stata misurata dopo 5 settimane utilizzando tre metodi diversi, istomorfometrico, istomorfometrico in</p> |

Nell'ambito del piano di sviluppo pre-commercializzazione di FemoSeal™ VCS, sono stati completati tre test funzionali sugli animali. Nel 2000, prima di iniziare gli studi clinici, è stato eseguito uno studio sugli animali per valutare la biofunzionalità di FemoSeal™ VCS. Questo studio ha valutato la capacità degli elementi di chiusura di mantenere la funzionalità fisiologica e il loro degrado. A 18 mesi il materiale del disco interno ed esterno non era più visibile, essendo stato sostituito da un tessuto fibroso endoluminale. In conclusione, è stata confermata la capacità dell'elemento di chiusura FemoSeal™ VCS di mantenere la funzionalità fisiologica quando viene utilizzato nel sistema circolatorio.

Nel 2002 è stato condotto uno studio sugli animali per valutare la biocompatibilità e la biofunzionalità di un impianto biodegradabile, FemoSeal™ VCS, progettato per ottenere l'emostasi nel sistema vascolare. In sintesi, la degradazione dell'impianto era quasi completa a 36 settimane e non si sono verificate reazioni tissutali avverse significative.

Un altro studio condotto sugli animali nel 2002 ha valutato la biocompatibilità e la biofunzionalità di un impianto biodegradabile, FemoSeal™ VCS, progettato per ottenere l'emostasi nel sistema vascolare. Dopo 5 settimane, l'incapsulamento del disco era completo e sono stati osservati segni di degradazione dei dischi interni ed esterni. In conclusione, è stata confermata la capacità dell'impianto di mantenere la funzione fisiologica quando utilizzato nel sistema circolatorio.

Nell'ambito del piano di sviluppo clinico per FemoSeal™ VCS, Radi Medical System AB ha condotto un'indagine clinica pre-commercializzazione. Questa indagine clinica non è pubblicata né disponibile online. Lo studio con il dispositivo modello n. 11200 è stato condotto nel 2002-2004 secondo la norma europea EN 540 (Indagine clinica dei dispositivi medici per soggetti umani) e in conformità alle Considerazioni generali ICH per le sperimentazioni cliniche e alle Linee guida di buona pratica clinica. I dettagli di questo studio sono documentati nel rapporto EU-SE-001. La sperimentazione clinica è stata documentata nel rapporto finale di Radi Medical Systems AB, "Multi-Centre Clinical Trial of the FemoSeal™ Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures". Lo studio clinico è stato effettuato con il primo modello di FemoSeal n. 11200 e si è concentrato sulla sicurezza e sull'efficacia dei componenti di chiusura impiantabili. L'unica differenza tra il primo modello n. 11200 e il modello attuale, C11202, è la misura di French, rispettivamente 6 F e 7 F, e il sistema di posizionamento migliorato. I benefici clinici, l'uso previsto, i principi di funzionamento e le materie prime degli elementi di chiusura impiantabili, il disco sigillante interno e il disco di bloccaggio esterno rimangono invariati.

L'uso previsto del dispositivo era destinato ai pazienti sottoposti a procedure diagnostiche o interventistiche cardiache che utilizzavano l'arteria femorale come punto di accesso. L'obiettivo di questo studio era determinare la sicurezza, le prestazioni e l'efficacia di FemoSeal™ VCS. Si trattava di uno studio prospettico, multicentrico, in aperto, a braccio singolo, con follow-up di 30 giorni.

L'endpoint primario di performance era il tempo di emostasi, definito come l'assenza di sanguinamento acuto. L'endpoint di sicurezza primario era l'incidenza di complicanze vascolari gravi a 30 giorni. Gli endpoint secondari includevano il tempo per la deambulazione, la percentuale di fallimento del trattamento, l'incidenza di eventi avversi e le caratteristiche di prestazione del dispositivo durante l'erogazione e il posizionamento.

I pazienti inclusi in questo studio erano adulti in grado di fornire il consenso informato e con almeno un polso pedidio intatto. I pazienti sono stati esclusi dallo studio se presentavano una delle seguenti condizioni:

- Anamnesi di vasculopatia periferica
- Malattia autoimmune
- Disturbo emorragico noto o anemia grave
- INR >1,5
- Infarto miocardico a 72 ore
- Ipertensione non controllata nonostante il trattamento
- Obesità che impedisce l'accesso con la tecnica di Seldinger

- Presenza di innesto o stent vascolare nel sito dell'arteriotomia
- Precedente puntura omolaterale nei 3 mesi precedenti
- Aspettativa di vita <6 mesi

Inoltre, i pazienti sono stati esaminati in sede intraoperatoria ed esclusi dallo studio se è stato osservato uno dei seguenti fattori:

- Diametro del lume dell'arteria femorale comune <5 mm
- Rami arteriosi nel raggio di 2 cm in prossimità del sito di venipuntura
- Stenosi significativa nel raggio di 3 cm in prossimità del sito di venipuntura
- Uso del kit introduttore primario >6 Fr
- Puntura in corrispondenza o distalmente alla biforcazione femorale
- Punture femorali multiple
- Puntura nota o sospetta della parete femorale posteriore
- Ematoma di grandi dimensioni (2:6 cm) al termine della procedura
- Difficoltà di inserimento dell'introduttore primario per la procedura a causa di tessuto o vaso tortuoso

Questo studio a protocollo singolo è stato condotto in due parti: Durante la Parte 1 sono stati selezionati 20 pazienti, poi è stata completata l'analisi della sicurezza e quindi sono stati selezionati altri 60 pazienti nella Parte 2.

Nella Parte 1, l'età media dei pazienti selezionati era di 65,9 anni, il 70,0% dei pazienti era di sesso maschile e il 95% dei pazienti assumeva farmaci concomitanti. Nella Parte 2 dello studio, l'età media era di 63,8 anni, il 78% era di sesso maschile e il 100% assumeva farmaci concomitanti.

I pazienti sottoposti a procedure diagnostiche (Parte 1 e Parte 2) o interventistiche (Parte 2) di cateterizzazione cardiaca sono stati ammessi allo studio. Le procedure sono state conformi allo standard di trattamento in ciascuno degli ospedali che hanno effettuato la selezione, seguite dall'uso di FemoSeal™ VCS. I dati dei pazienti sono stati raccolti al basale, durante la procedura e a 1 giorno e 30 giorni dopo la procedura. I risultati sono riassunti nella **Tabella 1.5** e indicano che FemoSeal™ VCS è sicuro ed efficace per l'uso in questa categoria di pazienti.

**Tabella 1.5 Risultati clinici riportati in uno studio pre-commercializzazione**

|                                                                                                                      | Parte 1     | Parte 2                  |
|----------------------------------------------------------------------------------------------------------------------|-------------|--------------------------|
| Numero di pazienti                                                                                                   | 20          | 60                       |
| Tempo medio per l'emostasi                                                                                           | 1,2 minuti  | 1,6 minuti <sup>a</sup>  |
| Tempo medio per la deambulazione                                                                                     | 72,2 minuti | 87,5 minuti <sup>b</sup> |
| Incidenza delle complicanze vascolari gravi <sup>c</sup>                                                             | 0 (0%)      | 1 (2%)                   |
| Numero di pazienti con eventi avversi                                                                                | 5 (25%)     | 19 (32%)                 |
| Fallimento del trattamento (definito come complicanze vascolari gravi, necessità di compressione manuale o entrambe) | 0 (0%)      | 3 (5%)                   |
| Malfunzionamenti del dispositivo                                                                                     | 0 (0%)      | 6 (10%)                  |

<sup>a</sup>Sulla base di un campione totale di 58 pazienti, 2 non hanno raggiunto l'emostasi al momento della procedura a causa di precedenti punture omolaterali. L'emostasi è stata ottenuta a 7 minuti e a 37 minuti per questi pazienti.

<sup>b</sup>Sulla base di un campione totale di 59 pazienti: 1 paziente non è stato incluso perché è stato inserito nel respiratore a causa di un edema polmonare e non è stato in grado di deambulare per oltre una settimana.

<sup>c</sup>Definita come complicanza vascolare che richiede la trasfusione di sangue o la riparazione chirurgica, o infezione locale che richiede la somministrazione di antibiotici, il ricovero o l'estensione del ricovero, o il debridement del sito

Non sono state osservate complicanze vascolari gravi nella Parte 1 dello studio. Nella Parte 2 dello studio è stata segnalata una complicanza vascolare grave: pseudoaneurisma riportato a un giorno dalla procedura. L'evento ha richiesto una compressione ecoguidata e un'iniezione di trombina nello pseudoaneurisma, prolungando il ricovero del paziente.

Dei cinque eventi avversi riportati nella Parte 1 dello studio, si è verificato un possibile evento avverso correlato al dispositivo: un evento non grave di sanguinamento acuto a 1 giorno dall'intervento. Dei 19 eventi avversi riportati nella Parte 2 dello studio, sono stati osservati tre eventi avversi non gravi legati al dispositivo, come ematomi, e sei eventi non gravi probabilmente legati al dispositivo, tra cui tre segnalazioni di trasudamento persistente, due ematomi e un dolore alla gamba dopo l'esercizio fisico.

Nella Parte 2 erano presenti tre pazienti considerati fallimenti del trattamento: due a causa del mancato raggiungimento dell'emostasi senza l'uso della compressione e uno a causa della complicità vascolare maggiore (pseudoaneurisma). Nella Parte 1 dello studio non sono stati riscontrati fallimenti nel trattamento.

Dei sei malfunzionamenti del dispositivo nella Parte 2 dello studio, tre non hanno interferito con la procedura, uno è stato attribuito a un errore dell'operatore, uno a perdite dell'introduttore e uno alla rottura del filamento. Gli ultimi due problemi sono stati affrontati con gli aggiornamenti dei modelli implementati in C11202.

La Parte 2 dello studio clinico pre-commercializzazione non ha riportato i risultati del follow-up a 6 mesi a causa della mancata rispondenza del paziente. I risultati dello studio clinico pre-commercializzazione (EU-SE-001) di 30 giorni, in linea con il periodo di tempo di follow-up della letteratura clinica, dimostrano che FemoSeal™ VCS è sicuro ed efficace.

#### 1.4.2 Riepilogo dei dati degli studi clinici post-commercializzazione

Sono stati completati quattro studi clinici post-commercializzazione descritti nella **Tabella 1.6** sottostante. Queste indagini cliniche non sono pubblicate né disponibili online.

**Tabella 1.6 Studi clinici post-commercializzazione**

Lo studio del 2006 è stato condotto per confermare la sicurezza e l'efficacia dell'attuale dispositivo con un sistema di erogazione migliorato e per ottenere un feedback sulle Istruzioni per l'uso e sul programma di formazione FemoSeal™ VCS. Lo studio ha incluso 100 pazienti e l'endpoint primario è stato il raggiungimento dell'emostasi o la necessità di ulteriori compressioni manuali o meccaniche. Questo studio ha concluso che l'applicazione di FemoSeal™ VCS è andata a buon fine nella maggior parte dei casi (il 91% ha ottenuto un'emostasi immediata).

Lo studio del 2008 ha selezionato 50 pazienti per valutare la sicurezza e le prestazioni di FemoSeal™ VCS quando viene utilizzato durante la normale routine clinica in pazienti sottoposti a una cateterizzazione cardiaca con un introduttore da 7 Fr. L'endpoint primario dello studio era la raccolta di dati sul tempo di emostasi e sul tempo per la deambulazione senza ulteriori compressioni, manuali o meccaniche. I risultati dello studio hanno concluso che il tempo medio di emostasi è stato di 57,8 secondi e tutti i pazienti sono stati in grado di deambulare dopo 4 ore di riposo a letto.

Lo studio del 2009 è stato condotto per valutare la nuova confezione FemoSeal™ VCS. Nello studio sono stati selezionati 25 pazienti. L'endpoint primario era quello di stabilire se l'utente avesse riscontrato problemi con la confezione. Gli utenti non hanno riscontrato problemi relativi

alla nuova confezione FemoSeal™ VCS. Questo studio ha anche raccolto dati per il tempo di emostasi.

Lo studio 2022 si proponeva di raccogliere in modo proattivo i dati di sicurezza ed efficacia di FemoSeal VCS nel raggiungere l'emostasi del sito di accesso all'arteria femorale comune (CFA) in soggetti reali sottoposti a procedure endovascolari percutanee. Allo studio sono stati ammessi 230 pazienti. Gli endpoint primari per lo studio di registro sono il successo procedurale (ovvero emostasi del sito di venipuntura riuscita) e la riduzione di complicazioni gravi (ad es. lesioni vascolari, emorragia correlata al sito di accesso, infezione del sito di accesso, compressione manuale ripetuta e nuova ischemia acuta della gamba omolaterale correlata al sito di accesso). Lo studio ha concluso che FemoSeal™ VCS funziona bene in ambienti reali e fornisce un'emostasi efficace e bassi tassi di complicanze nel sito di accesso per i pazienti sottoposti a interventi endovascolari periferici. Ha dimostrato buone prestazioni con un breve tempo di emostasi e un buon feedback di usabilità da parte dell'operatore, rendendo FemoSeal™ VCS un valido dispositivo per la chiusura degli accessi femorali.

### 1.4.3 Riepilogo dei dati del follow-up clinico post-commercializzazione

#### 1.4.3.1 Follow up clinici post-commercializzazione completati

Un riepilogo delle attività di follow-up clinico post-commercializzazione completate è descritto nella **Tabella 1.7** di seguito.

**Tabella 1.7. Attività di follow-up clinico post-commercializzazione**

|                                                                   |  |  |  |  | (36,6) (media (SD)); 57,0 (36,0-81,0) (mediana (IQR)) <ul style="list-style-type: none"> <li>○ Tutte le valutazioni delle prestazioni di FemoSeal™ VCS sono state favorevoli.</li> <li>○ Tutte le valutazioni del filo guida fornito con FemoSeal™ VCS sono state favorevoli.</li> <li>○ Un evento avverso (0,8%): i dischi FemoSeal™ VCS non erano ben allineati probabilmente a causa dell'uso di un filo guida rigido (Boston Scientific Amplatz Super Stiff, 75 cm, 0,035 pollici) che richiedeva una compressione manuale per ottenere l'emostasi.</li> </ul> |

Terumo Medical Corporation ha completato tre sondaggi di alta qualità tra gli utenti medici durante l'attuale periodo di riferimento (1° settembre 2019-31 agosto 2024).

I sondaggi clinici FemoSeal™ hanno raccolto dati clinici proattivi in relazione alla sicurezza e alle prestazioni di FemoSeal™ VCS durante l'uso clinico. Il sondaggio comprendeva domande incentrate sul dispositivo e sugli accessori associati, compreso il filo guida da 0,038", e sulle loro interazioni dirette. Le indagini cliniche sul filo guida hanno raccolto dati clinici proattivi in relazione alla sicurezza e alle prestazioni durante l'uso clinico del filo guida da 0,038" fornito con FemoSeal™ VCS. Le domande del sondaggio riguardavano specificamente l'uso generale del filo guida, dall'inserimento attraverso l'introduttore procedurale nel sistema vascolare fino alla rimozione.

FemoSeal™ VCS e il filo guida da 0,038" in dotazione al dispositivo hanno ricevuto tutte valutazioni accettabili e sono stati presentati sei (6) reclami per il dispositivo e nove (9) non reclami per il filo guida sulla base della valutazione dei commenti ricevuti dai sondaggi clinici di alta qualità. I reclami sono stati valutati sia per FemoSeal che per il filo guida nell'ambito del processo di monitoraggio post-commercializzazione di Terumo. Non sono stati individuati nuovi rischi e/o livelli di rischio.

Nel 2024 è stato completato un sondaggio tra gli utenti medici nell'ambito delle attività PMCF. I risultati del sondaggio hanno dimostrato che la valutazione delle prestazioni e la sicurezza di FemoSeal™ VCS sono state complessivamente molto favorevoli. È stata inoltre dimostrata la compatibilità di fili guida diversi da quello standard fornito con FemoSeal™ VCS.

#### **1.4.3.2 Follow-up clinico post vendita in corso/previsto**

TMC ha un'attività di follow-up clinico post-commercializzazione in corso/pianificate. Verrà completato un sondaggio clinico per raccogliere in modo prospettico il feedback relativo all'uso del filo guida con FemoSeal VCS distribuito nel mercato UE. Il sondaggio sarà completato dai medici in modo da studiare quali fili guida hanno utilizzato durante la procedura. Lo scopo di questo sondaggio è quello di colmare una lacuna identificata come la mancanza di letteratura e di commenti di revisori esterni sulla compatibilità del FemoSeal™ VCS con l'uso di altri fili guida di marche diverse da Terumo. Il feedback include risultati tecnici, prestazioni cliniche e sicurezza relativi alle prestazioni del dispositivo con fili guida diversi.

#### **1.4.4 Riepilogo dei dati della revisione sistematica della letteratura**

Terumo Medical Corporation effettua revisioni sistematiche della letteratura per raccogliere e valutare i dati sulla sicurezza clinica e sulle prestazioni derivanti da studi pubblicati su FemoSeal™ VCS e/o dispositivi simili. Lo scopo dello screening annuale della letteratura pubblicata è quello di individuare effetti collaterali precedentemente sconosciuti, monitorare gli effetti collaterali noti, individuare i rischi emergenti e individuare un possibile uso sistematico improprio o off-label di FemoSeal™ VCS.

La più recente revisione sistematica della letteratura, che ha riguardato il periodo dal 1° settembre 2019 al 31 agosto 2024, ha individuato 28 studi pubblicati che hanno fornito dati sulla sicurezza clinica e sulle prestazioni del FemoSeal™ VCS. Ventitré riferimenti hanno riportato l'uso on-label di FemoSeal™ VCS, mentre l'uso off-label è stato riportato in nove studi. Nel complesso, la revisione della letteratura su studi specifici per l'uso di FemoSeal™ VCS mostra una categoria oggetto di studio rappresentativa dei pazienti dell'UE sottoposti a procedure di cateterizzazione vascolare percutanea. Consultare la **Sezione 3** per un elenco di queste 23 pubblicazioni on-label sottoposte a peer-review.

Le prestazioni cliniche sono state valutate con le seguenti misure:

- Il tempo di emostasi è migliore o paragonabile allo stato dell'arte per la chiusura percutanea della comune arteria femorale.
- Il tempo di deambulazione è migliore o paragonabile allo stato dell'arte per la chiusura percutanea della comune arteria femorale.
- Il tasso di complicanze post-operatorie è paragonabile o inferiore agli standard di cura attuali.

Sulla base di queste misurazioni delle prestazioni cliniche, i dati riportati in questa revisione della letteratura hanno dimostrato che FemoSeal™ VCS può essere utilizzato con successo nella chiusura della puntura arteriosa femorale (arteriotomia) in pazienti sottoposti a cateterizzazione percutanea utilizzando un introduttore procedurale di massimo 7 Fr. L'emostasi completa è stata raggiunta nella maggior parte dei pazienti (79,65-100%) dei casi ed è stata associata a un tempo mediano di emostasi di 0,5 minuti, tempo medio di dimissione di 3 giorni. Tra il 69,2-86,7% dei pazienti è stato in grado di deambulare 5 ore dopo la chiusura, con un riposo postoperatorio medio a letto di 349 min. L'insuccesso di FemoSeal™ VCS è stato osservato nel 3,68-4% dei casi ed è stata necessaria un'ulteriore compressione manuale nello 0,9-4,4% delle procedure.

La sicurezza clinica è stata valutata in base a eventi avversi, tra cui, a titolo esemplificativo ma non esaustivo:

- Sanguinamento
- Ematoma
- Pseudoaneurisma
- Ematoma
- Fistola arterovenosa
- Infezione
- Decesso

Per ciascuno di questi eventi avversi, il tasso di insorgenza riportato per FemoSeal™ VCS negli studi inclusi era inferiore o paragonabile ai tassi riportati storicamente per la compressione manuale e altri dispositivi di chiusura vascolare.

Dall'esame dei 10 referti non sono stati identificati eventi avversi, in quanto non sono stati individuati rischi nuovi, imprevisti, emergenti o inaccettabili.

L'efficacia complessiva dell'uso di FemoSeal™ VCS durante l'angiografia diagnostica o le operazioni interventistiche dipende da diversi fattori quali sesso, età, anatomia del paziente, comorbidità, posizionamento anatomico del sito di venipuntura, esperienza del chirurgo, metodo di posizionamento del VCD, assistenza postoperatoria, ecc. Oltre al successo tecnico, compreso il raggiungimento dell'emostasi, FemoSeal™ VCS ha offerto benefici clinici relativi alla chiusura vascolare dopo la puntura dell'arteria femorale, come la riduzione del tempo di emostasi e del tempo alla deambulazione. I risultati delle prestazioni di FemoSeal™ VCS sono coerenti con quelli attesi per questo tipo di dispositivi se utilizzati come previsto. Alcuni dei riferimenti recuperati durante il periodo di ricerca corrente hanno mostrato l'uso del dispositivo in una posizione anatomica diversa dall'arteria femorale comune e per la chiusura di arteriotomie >7 Fr, che è considerato off-label.

Durante la revisione non sono stati identificati effetti collaterali sconosciuti, rischi emergenti o possibili usi impropri sistematici del dispositivo. Tuttavia, se FemoSeal™ VCS viene utilizzato con cautela da medici qualificati, il dispositivo medico funziona come un dispositivo clinico utile e necessario. Nel complesso, la terapia target e quindi FemoSeal™ VCS soddisfano l'esigenza clinica attualmente esistente nel trattamento delle complicanze correlate all'accesso vascolare.

Complessivamente, i dati contenuti in questa revisione della letteratura non hanno evidenziato alcun problema di prestazioni o sicurezza in ambito clinico precedentemente sconosciuto, né eventi avversi verificatisi a tassi superiori a quelli previsti/accettabili. Pertanto, da questa revisione della letteratura si può concludere che il FemoSeal™ VCS, quando viene utilizzato per fornire la compressione per l'emostasi in corrispondenza dell'arteriotomia dopo la cateterizzazione percutanea, continua a funzionare come previsto e non è associato a gravi eventi per la sicurezza.

#### **1.4.5 Riepilogo dei dati della sorveglianza post-commercializzazione**

È in vigore un sistema PMS proattivo e la revisione di tutti i reclami è completata su base mensile e in conformità con le procedure di produzione interne. I dati relativi ai reclami sono stati analizzati dal 1° settembre 2019 al 31 agosto 2024. Complessivamente, sono stati inviati al fabbricante 28 rapporti di vigilanza sui dispositivi medici (MDV) e 476 rapporti di reclami dei clienti. Dei 28 rapporti MDV, 27 erano correlati a eventi avversi e uno a malfunzionamento del dispositivo. Si sono verificati due decessi durante il periodo di riferimento, ma nessuno dei decessi segnalati è stato ritenuto correlato al dispositivo in questione. Tra i 476 reclami presentati al fabbricante, i motivi più comuni dei reclami erano le difficoltà di posizionamento (146 occorrenze, tasso di occorrenza dello 0,0142%). Guasti durante l'estrazione costituiscono il secondo motivo più frequente, con un tasso dello 0,0126% (130 eventi).

FemoSeal™ Vascular Closure System ha registrato oltre 1.030.136 vendite a livello globale e 827.843 nello Spazio Economico Europeo. La frequenza calcolata dei reclami in base alle vendite globali è dello 0,046%. Il tasso complessivo di reclami dei clienti è molto basso. Non sono stati identificati nuovi rischi rispetto a quelli inclusi nelle Istruzioni per l'uso e nella documentazione sui rischi.

I tassi di insorgenza degli effetti collaterali indesiderati sono riportati nella **Tabella 1.2**. Tramite i reclami non sono stati individuati nuovi rischi imprevisti, emergenti o inaccettabili. Non si sono verificati aumenti significativi della frequenza o della gravità degli effetti collaterali indesiderati noti.

#### 1.4.6 Riepilogo generale delle prestazioni cliniche e di sicurezza

FemoSeal™ VCS è indicato per l'uso nella chiusura della puntura dell'arteria femorale comune (arteriotomia) in pazienti sottoposti a cateterizzazione percutanea con introduttore procedurale di dimensioni pari o inferiori a 2,33 mm (7 F). Questa valutazione clinica si basa su un'analisi completa dei dati clinici e della letteratura pre- e post-commercializzazione disponibili rilevanti per l'uso previsto di FemoSeal™ VCS.

È stata condotta una revisione completa della letteratura pubblicata nel periodo compreso tra il 1° settembre 2019 e il 31 agosto 2024. Le prove raccolte comprendevano 29 studi per il FemoSeal™ VCS. Le prove fornite nella valutazione clinica concludono che, se utilizzato come indicato, il dispositivo in questione è sicuro ed efficace e che eventuali rischi o effetti collaterali indesiderati, che possono essere associati al dispositivo nelle normali condizioni d'uso, costituiscono rischi accettabili se soppesati rispetto ai benefici per il paziente. I risultati delle prestazioni dei dispositivi in esame sono coerenti con quelli attesi per questo tipo di dispositivi quando vengono utilizzati come previsto.

I potenziali effetti collaterali indesiderati associati all'uso di FemoSeal™ VCS comprendono gli eventi avversi comunemente riportati con mezzi alternativi di chiusura dell'arteriotomia, ad esempio emorragia ed ematoma. Nel complesso, i tassi di insorgenza degli eventi avversi riportati con l'uso di FemoSeal™ VCS sono simili ai tassi riportati con la compressione manuale e dispositivi di chiusura vascolare simili. Nello specifico, per l'emorragia e l'ematoma, i tassi riportati per FemoSeal™ VCS sono inferiori ai tassi riportati per dispositivi di chiusura vascolare simili. Ciascuno degli eventi avversi segnalati, sia dalla letteratura pubblicata che dal monitoraggio post-commercializzazione, è stato individuato in precedenza (vedere **Sezione 1.3**).

I dati esistenti relativi alla sicurezza clinica e alle prestazioni di FemoSeal VCS suggeriscono che i benefici per il paziente derivanti dall'uso di questo dispositivo di chiusura vascolare superano i possibili rischi quando viene utilizzato in conformità con le Istruzioni per l'uso.

Come indicato nei paragrafi precedenti, i dati forniti per FemoSeal™ VCS dimostrano la coerenza tra i dati relativi al dispositivo in esame (ad esempio utilizzo del dispositivo, risultati di

sicurezza, prestazioni cliniche e benefici clinici), quelli relativi ai dispositivi equivalenti identificati e i dati relativi a dispositivi simili elencati nello Stato dell'Arte.

L'analisi incrociata dei dati di sicurezza non ha individuato alcuna carenza tra i seguenti elementi:

- Dati citati nello stato dell'arte
- Dati specifici del dispositivo in fase di valutazione
- Dati menzionati nei file di gestione dei rischi
- I dati menzionati nell'etichettatura e/o nelle IFU (vale a dire vengono affrontati i rischi residui da comunicare all'utente).

La sicurezza clinica è stata dimostrata dai bassi tassi di complicanze individuati nella letteratura clinica peer-reviewed pubblicata, dagli studi clinici sponsorizzati dall'azienda, dalla revisione dei dati post-commercializzazione e dall'assenza di ritiri dal mercato. Non sono stati riscontrati problemi di prestazioni; la letteratura ha esaminato l'uso del FemoSeal™ VCS in questione in conformità con l'uso previsto del fabbricante.

### **1.5 Possibili alternative diagnostiche o terapeutiche**

La compressione manuale viene tradizionalmente utilizzata per ottenere l'emostasi nel sito dell'arteriotomia dopo cateterizzazioni vascolari. È stata associata all'immobilizzazione del paziente per lunghi periodi di tempo (fino a 8 ore dopo una procedura) e a notevoli disturbi e degenze ospedaliere prolungate. Una recente analisi sistematica ha rilevato che il tempo mediano per ottenere l'emostasi con compressione manuale era di 20,8 minuti.<sup>1</sup>

Le alternative alla compressione manuale includono dispositivi emostatici esterni che applicano la compressione meccanica al sito dell'arteriotomia. Questi dispositivi non abbreviano il tempo per l'emostasi o la deambulazione, ma riducono il personale necessario sostituendo la compressione manuale con quella meccanica. I tassi di eventi avversi associati all'uso della compressione meccanica sono simili ai tassi di compressione manuale.

I dispositivi di chiusura vascolare, come FemoSeal™ VCS, sono progettati per chiudere l'arteriotomia. L'obiettivo è ridurre il tempo di emostasi e consentire una deambulazione più rapida. Una recente analisi sistematica, comprendente 13 dispositivi disponibili in commercio, ha rilevato che il tempo mediano per ottenere l'emostasi con un dispositivo di chiusura vascolare era di 5,4 minuti. Il tempo mediano per l'emostasi per i singoli dispositivi di chiusura vascolare variava da 1 minuto (FemoSeal™ VCS) a 14 minuti con la maggior parte dei dispositivi tra 4 e 10 minuti.<sup>1</sup>

Gli eventi avversi comunemente segnalati associati alla chiusura del sito dell'arteriotomia, con compressioni manuali, dispositivi emostatici esterni o dispositivi di chiusura vascolare, comprendono ematoma, emorragia nel sito di accesso, pseudoaneurisma, fistola arterovenosa e infezione. La stessa analisi sistematica (34 studi randomizzati controllati, 14.401 pazienti) ha

rilevato che i tassi di eventi avversi erano simili tra la compressione manuale e l'uso di dispositivi di chiusura vascolare, con l'eccezione che l'emorragia tendeva a essere leggermente più elevata con questi ultimi.<sup>1</sup>

## 1.6 Profilo utente e formazione suggeriti

Gli utilizzatori previsti di FemoSeal™ Vascular Closure System sono medici con una formazione che li abilita a eseguire accessi e chiusure arteriose per procedure endovascolari attraverso l'arteria femorale comune e che hanno partecipato a un programma di formazione per medici FemoSeal™ di Terumo Medical Corporation.

안전성 및 임상 성과 요약(SSCP)은 FemoSeal™의 혈관 봉합기구(VCS) 안전성 및 임상 성과의 주요 측면에 대한 업데이트 요약을 공개합니다.

사용자/의료 전문가를 위한 기기의 안전성 및 임상 성능에 대한 요약은 아래 **섹션 1.0**에 제공됩니다.

## 1.0 사용자/의료 전문가를 위한 요약

SSCP는 장치의 안전한 사용을 보장하기 위해 주요 문서로 사용 지침을 대체하지 않으며, 대상이 되는 사용자 또는 환자에게 진단 또는 치료 제안을 하기 위한 것이 아닙니다. SSCP는 이식 카드 또는 기타 필수 문서의 필수 정보를 대체하기 위한 것이 아닙니다.

### 1.1 기기 사용 목적

#### 1.1.1 사용 목적

FemoSeal™ 혈관 봉합기구는 총 대퇴 동맥을 통한 경피적 카테터 삽입 후 동맥 천자를 봉합하기 위한 의료기기입니다.

#### 1.1.2 적응증

FemoSeal™ 혈관 봉합기구는 7F(2.33mm) 이하의 시술용 도관을 사용하여 경피적 카테터 삽입을 받은 환자의 일반적인 대퇴 동맥 천자(동맥 절개술)를 봉합하는 데 사용됩니다.

#### 1.1.3 금기 사항 및/또는 제한 사항

FemoSeal™ 혈관 봉합기구는 7F(2.33mm) 이상의 도관 또는 장치를 사용한 동맥 절개술 환자에게는 사용할 수 없습니다.

#### 1.1.4 표적 환자 집단

FemoSeal™ 혈관 봉합기구의 안전성과 유효성이 7F(2.33mm) 이하의 시술용 도관을 사용하여 경피적 카테터 삽입을 받은 18세 이상의 환자에서 확인되었습니다.

#### 1.1.5 특수 환자 집단

다음 환자 집단에서 FemoSeal™ 혈관 봉합기구의 안전성과 유효성은 확인되지 않았습니다.

- 기존 자가 면역 질환이 있는 환자.
- 치료용 혈전 용해제를 복용하는 환자.
- 임상적으로 중대한 말초 혈관 질환이 있는 환자.
- 비 조절성 고혈압 (> 수축기 220mmHg 또는 > 이완기 110mmHg)이 있는 환자.
- 혈소판 감소증(< 100,000 혈소판 수치) 또는 빈혈(Hgb < 10 mg/dl)을 포함한 출혈 장애가 있는 환자.

- 총 대퇴 동맥 내강이 5mm 미만인 환자.
- 신장 및/또는 간 장애 환자.
- 기타 관련된 동반이환 환자.
- 특정 인종 및/또는 민족 출신 집단.
- 72시간 이내에 심근 경색이 있었던 환자.
- 천자 부위에 혈관 이식 또는 스텐트가 있는 환자.
- 임신 중이거나 수유 중인 환자.
- 18세 미만의 환자.

### 1.1.6 대상 사용자

FemoSeal™ 혈관 봉합기구의 대상 사용자는 총 대퇴 동맥을 통한 혈관 내 시술에 대한 동맥 접근 및 지혈 수행 자격을 갖추었으며 테루모 메디컬 주식회사(Terumo Medical Corporation) FemoSeal™ 의사 교육 프로그램에 참여한 의사입니다.

## 1.2 장치 설명

### 1.2.1 장치 설명

FemoSeal™ 테루모 메디컬 주식회사(Terumo Medical Corporation, TMC)가 제작한 혈관 봉합기구는 총 대퇴 동맥을 통한 경피적 카테터 삽입 후 대퇴 동맥 지혈을 하도록 만들어진 재흡수 가능한 혈관 봉합기구입니다.

FemoSeal™ 봉합 부품은 2개의 재흡수성 폴리머 디스크, 내부 씰(seal) 및 외부 잠금 디스크로 구성되어 있으며, 이는 재흡수성 멀티 필라멘트에 의해 결합되며 기계적으로 동맥 절개를 봉합합니다(그림 1.1 및 그림 1.2 참조). 콘 하우징 도관을 통해 배치된 후, 외부 잠금 디스크가 멀티 필라멘트 샤프트에 탬핑되어 내부 잠금 디스크와 외부 잠금 디스크 사이의 천자 부위가 기계적으로 봉합됩니다. 내부 씰(seal)과 외부 잠금 디스크는 멀티 필라멘트 샤프트의 마찰을 통해 제 위치에 고정됩니다. 기계적 수단에 의해 지혈됩니다. 봉합 부품은 가수분해에 의해 분해됩니다.

삽입형 봉합 부품, 내부 씰(seal) 및 외부 잠금 디스크는 18개월 후에 분해되며 멀티 필라멘트는 2년에서 3년 후 주변 조직에 의한 가수분해로 분해 및 흡수됩니다. 동맥 절개술에서 압박을 유지하기 위한 삽입형 봉합 부품의 기능은 최대 8시간 동안 시험되었습니다. 분해 생성물은 대사 작용을 거친 후 소변으로 배설되거나 폐를 통해

이산화탄소로 배출됩니다. 동물 연구에서 축적 효과가 관찰되지 않았습니다. 시술 중 살아있는 조직이나 혈액과 접촉하게 되는 FemoSeal™의 추가 구성 요소에는 콘 하우스링 도관, 확장기, 탬핑 튜브, 푸셔 및 가이드와이어가 있습니다.

그림 1.1 각각 내부 썰 및 외부 잠금 디스크

그림 1.2 내부 썰 및 외부 잠금 디스크 배치

FemoSeal™ 장치에는 확장기 및 0.038(0.97mm) OD, 27.5"(70cm) 길이의 가이드와이어 및 J-스트레이트너가 함께 포장됩니다. 아래 그림 1.3을 참조하십시오. 가이드와이어는 폴리에틸렌 튜브 내에 포함됩니다. 모든 구성품은 고정된 종이 트레이에 포장됩니다. 포장에는 환자 이식 카드도 포함됩니다. FemoSeal™ 혈관 봉합기구는 장치가 의도한 대로 기능하는 데 추가 부속품을 필요로 하지 않으며 본 장치는 제품 포장 안에 들어 있는 확장기 및 가이드와이어와 함께 사용해야 합니다.

그림 1.3 가이드와이어와 확장기가 장착된 FemoSeal™ VCS 장치

### 1.2.2 원자재 및 구성품

아래 표 1.1은 FemoSeal™ VCS의 구성품을 나열합니다.

표 1.1 FemoSeal™ VCS 원자재 및 구성품

\* 삽입형 장치의 일부; 삽입형 구성품은 MRI에 안전합니다

FemoSeal™ VCS는 에틸렌 옥사이드(EO)로 멸균 처리되었으며 일회용 의료 기기입니다.  
FemoSeal™ VCS 장치는 재사용할 수 없도록 만들어졌습니다.

## 작동 모드

FemoSeal™ VCS는 총 대퇴 동맥 내외부에 삽입형 봉합 부품을 배치하여 기계적 지혈을 촉진합니다. 천공 부위를 지혈하는 내부 씰(seal)과 내부 씰(seal)을 제 위치에 고정하는 외부 잠금 디스크가 출혈을 방지하는 메커니즘을 제공합니다.

### 1.2.3 임상적 유익성

FemoSeal™ VCS는 총 대퇴 동맥 천자 후 혈관 봉합과 관련하여 다음과 같은 임상적 유익성을 제공합니다.

- 지혈까지 시간 단축<sup>1</sup>
- 조기 활동까지 시간 단축<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### 1.2.4 이전 세대 혹은 변형 모델

- FemoSeal™ VCS (#11200)의 첫 번째 버전은 2005년 및 2006년 일정 기간 유럽 시장에서 판매되었습니다.
- 현재 FemoSeal™ VCS(#11202)는 2006년 3월 28일 이후 전달 시스템 개선을 포함하여 출시되었습니다.

### 1.2.5 기기와 함께 사용하도록 고안된 부속품

FemoSeal™ 장치는 확장기, 0.038"(0.97 mm) OD, 27.5"(70 cm) 길이의 가이드와이어 및 J-스트레이트너와 함께 포장됩니다. 가이드와이어는 FemoSeal™ 장치의 부속품입니다. J-스트레이트너는 가이드와이어의 구성 요소이며, 확장기는 FemoSeal™ 장치의 구성 요소입니다. 가이드와이어만 부속품으로 간주됩니다. 가이드와이어는 폴리에틸렌 튜브 내에 포함됩니다. 모든 구성품은 고정된 종이 트레이에 포장됩니다. 포장에는 환자 이식 카드도 포함됩니다. FemoSeal™ 혈관 봉합기구는 장치가 의도한 대로 기능하는 데 추가 부속품을 필요로 하지 않으며 본 장치는 제품 포장 안에 들어 있는 확장기 및 가이드와이어와 함께 사용해야 합니다.

### 1.2.6 기기와 함께 사용하도록 고안된 기타 기기 및 제품

FemoSeal™ VCS는 제대로 작동하기 위해 추가 장치가 필요하지 않습니다.

### 1.3 위험 및 경고

#### 1.3.1 잔존 위험 및 바람직하지 않은 영향

잔여 위험의 결과로 FemoSeal™ VCS를 사용하는 것과 관련된 알려진 또는 예측 가능한 이상 사례, 피해 및 합병증은 표 1.2에 나와 있습니다. 발생률은 위험 문서 분석을 기반으로 하며, 2019년 9월 1일부터 2024년 8월 31일까지의 시판 후 조사 데이터를 기반으로 계산됩니다. FemoSeal™ VCS에 대해 알려지지 않은 잔존 위험성이 없으며 모든 해당 위험은 사용 지침 및 위험 관리 프로세스를 통해 해결했습니다.

표 1.2. FemoSeal 이상 사례/합병증

| 피해      | 발생률(%) | 완화 조치                                                               |

### 1.3.2 경고 및 주의 사항

#### 경고 사항

1. 포장에 손상이 있거나 멸균 장벽이 손상된 경우 사용하지 마십시오.
2. 유효기간이 지난 후에는 사용하지 마십시오. 생분해성 구성품이 제대로 기능하지 않을 수 있습니다.
3. 어떤 품목이라도 손상되거나 결함이 보이면 사용하지 마십시오.
4. 시술용 도관 또는 주변 조직에 세균 오염이 발생한 경우 FemoSeal™ 혈관 봉합기구를 사용하면 감염이 발생할 수 있습니다.
5. 후방 동맥벽이 뚫렸거나 두 개 이상의 동맥이 뚫렸다고 의심되는 경우 FemoSeal™ 혈관 봉합기구에만 의존하여 동맥을 지혈하지 마십시오. 추가적으로 수동 압박법이나 기계적 압박법을 사용하십시오.
6. 천공 부위가 대퇴 동맥의 분기부에 있거나 원위부에 있는 경우 내측 씰(seal)이 잘못 배치될 위험이 있으므로 FemoSeal™ 혈관 봉합기구를 사용해서는 안 됩니다. 이는 출혈 합병증 및/또는 정상 혈류 장애를 유발할 수 있습니다.
7. 절개 부위에서 동맥 출혈이 지속되는 경우 지혈되기 전까지 멀티 필라멘트를 자르지 마십시오. 지혈이 되지 않으면 멸균 상처 드레싱으로 멀티 필라멘트를 고정하고 지혈될 때까지 보조 압박을 가하십시오. 동맥 출혈이 지속되는 경우, 심각한 출혈 합병증이 발생하여 환자 상해 또는 사망을 초래할 수 있습니다.
8. 천자 부위가 서혜부 인대에 근접한 경우에는 후복막 혈종이 생길 수 있으므로 FemoSeal™ 혈관 봉합기구를 사용하지 마십시오.
9. 출혈 위험이 큰 환자는 혈액 손실이 증가하여 수혈이 필요할 수 있습니다.

10. 내부 디스크가 분리되면 혈전 및/또는 색전 현상을 일으킬 수 있습니다.

### 주의 사항

1. FemoSeal™ 혈관 봉합기구 배치 시술은 장치 사용에 대한 적절한 교육을 받은 의사가 수행해야 합니다.
2. FemoSeal™ 혈관 봉합기구를 배치하기 전에 제한된 대퇴 혈관 조영술 또는 초음파 유도식 대퇴부 천자를 실시하십시오.
3. 다음의 경우 시술을 중단합니다.
  - 총 대퇴 동맥의 내강 직경이 < 5mm인 경우.
  - 협착증 및/또는 총 대퇴 동맥 천자 부위 근처에 상당한 플라크가 있는 경우.
  - 동맥 천자 부위가 대퇴 동맥 분기점 또는 대퇴 동맥 분기점의 말단에 있는 경우.
  - 일반적인 대퇴 동맥 천자 부위 근처에 비정상적인 분지 또는 혈관 이상이 있는 경우.
4. 혈종이 있는 경우, 콘 하우징 도관을 동맥에 올바르게 삽입하기 위해 각별히 주의해야 합니다.
5. 단일벽 천자 기법을 사용하십시오. 동맥의 후벽을 뚫지 마십시오.
6. FemoSeal™ 혈관 봉합기구를 사용할 때는 항상 멸균법을 준수하십시오.
7. FemoSeal™ 혈관 봉합기구는 일회용이며 어떤 방식으로든 재멸균 또는 재사용해서는 안 됩니다. FemoSeal™ 장치는 재사용할 수 없도록 만들어졌습니다.
8. 내부 씰(seal) 배치 시 예상치 못한 저항이 발생하면 시술을 중단하십시오.
9. 내부 씰(seal)을 올바르게 배치하려면 엄지손가락 위치를 조정하여 버튼이 뒤로 자유롭게 튀어 오를 수 있도록 합니다.
10. 외부 잠금 디스크를 배치하기 전에 FemoSeal™ 장치의 콘 하우징 도관의 팁이 피부 표면 아래에 있는지 확인하십시오. 외부 잠금 디스크는 대퇴 동맥과 피부 사이의 거리가 짧은 환자의 피부 표면 위에 부주의하게 배치될 수 있습니다.
11. 올바른 배치를 위해 배치 전에 피부 절개가 필요할 수 있습니다.
12. 내부 씰(seal)이 동맥 내부에 있지만 버튼을 완전히 누르고 외부 잠금 디스크를 배치할 수 없는 경우 FemoSeal™ 봉합 부품을 제거하기 위해 수술이 필요할 수 있습니다.

13. 18개월 이내에 동일한 대퇴 동맥의 재천자가 필요할 경우, 이전의 FemoSeal™ 혈관 봉합기구 접근 부위에 적어도 1센티미터 이상 근접하도록 천자를 해야 합니다.
14. 봉합 부위 검사와 관련하여 의사의 지시를 따르도록 환자에게 알려주십시오.
15. 환자에게 향후 18개월간 환자 정보 카드를 소지하도록 지시하십시오

### 퇴원 시 주의 사항

퇴원을 고려하기 전에 환자의 임상 상태에 대해 다음과 같은 내용을 평가하십시오.

1. 봉합 부위에 출혈 및/또는 혈종.
2. 걷는 동안 통증.
3. 봉합 부위의 감염 징후.

### 1.3.3 현장 안전 시정 조치

2019년 9월 1일부터 2024년 8월 31일까지 FemoSeal™ VCS와 관련된 현장 안전 시정 조치가 1건 있었습니다.

2022년, Terumo는 Elkton에서 제조한 FemoSeal 제품의 탬핑력 측정 및 견인력에 대한 공정 및 로트 릴리스 테스트 실패를 주장하는 컴플레인으로 인해 자발적으로 FemoSeal™ VCS를 리콜했습니다. 한국에서 총 950개가 리콜되었습니다.

## 1.4 임상 평가 및 시판 후 임상 추적관찰

**Table 1.3**에는 FemoSeal™ VCS의 출시와 더불어 시판 후 연구 및 시판 후 임상 추적 활동을 포함하는 핵심 연구 목록이 나열되어 있습니다. 연구에 사용된 장치의 버전은 아래 표에 나와 있습니다. 첫 번째 버전의 FemoSeal™ VCS(#11200)는 2006년까지 시장에 출시되었으며, 다음 버전(#C11202)은 2006년에 시장에 출시되어 현재까지 시장에서 판매되고 있습니다.

FemoSeal™ VCS의 시판 전 개발 계획에 따라 3건의 동물 기능성 실험이 완료되었습니다. 임상 연구 시작 전인 2000년에 동물 연구를 수행하여 FemoSeal™ VCS의 생체 기능성을 평가했습니다. 이 연구에서는 생리적 기능을 유지하는 봉합 부품의 능력 및 분해 수준을 평가했습니다. 18개월 시점에 관내 섬유 조직으로 대체되어 내부 및 외부 디스크 물질은 더 이상 보이지 않았습니다. 결론적으로, 순환계에서 사용했을 때 생리적 기능을 유지하는 FemoSeal™ VCS closure 부품의 기능이 확인되었습니다.

2002년 혈관계에서 지혈하도록 고안된 생분해성 임플란트인 FemoSeal™ VCS의 생체 적합성 및 생체 기능성을 평가하기 위해 동물 연구를 수행했습니다. 요약하면, 임플란트의 분해는 36주까지 거의 완료되었고 유의미한 조직 이상 반응은 없었습니다.

2002년에 시행한 또 다른 동물 연구에서는 혈관계에서 지혈하도록 고안된 생분해성 임플란트인 FemoSeal™ VCS의 생체 적합성과 생체 기능성을 평가했습니다. 5주 후에 디스크의 피막 형성이 완료되었으며, 내외부 디스크에 분해의 징후가 관찰되었습니다. 결론적으로, 순환계에 사용될 때 생리적 기능을 유지하는 임플란트의 기능이 확인되었습니다.

FemoSeal™ VCS 임상 개발 계획의 일환으로 Radi Medical System AB는 시판 전 임상 연구를 수행했습니다. 본 임상연구는 온라인에 게시되거나 제공되지 않습니다. 장치 모델 #11200을 사용한 연구는 유럽 표준 EN 540(인간 피험자용 의료기기의 임상 조사) 및 임상시험을 위한 ICH 일반 고려사항 및 우수 임상 실무 지침에 따라 2002년에서 2004년 사이에 실시되었습니다. 이 연구의 세부 사항은 보고서 EU-SE-001에 문서화되어 있습니다. 본 임상 시험은 Radi Medical Systems AB의 "진단/중재 심장 시술 후 대퇴 동맥 천자 지혈을 위한 FemoSeal 혈관 봉합기구의 다기관 임상 시험"의 최종 보고서에 문서화되었습니다. 본 임상 연구는 FemoSeal™의 첫 번째 모델 #11200으로 수행되었으며 이식형 봉합 구성품의 안전성과 유효성에 중점을 두었습니다. 첫 번째 모델 #11200과 현재 모델 C11202 사이에 유일하게 다른 점은, 프랑스 크기 각각 6F 및 7F와 개선된 전달 체계입니다. 임상적 이점, 용도, 작동 원리, 이식형 봉합 부품의 원자재, 내부셀 및 외부 잠금 디스크는 변경되지 않았습니다.

장치의 용도는 대퇴 동맥을 접근 부위로 사용하여 진단 및 심장 중재 시술을 받는 환자를 위한 것입니다. 이 연구의 목적은 FemoSeal™ VCS의 안전성, 성능 및 유효성을 확인하는 것입니다. 이는 30일 추적관찰을 통한 전향적, 다기관, 단일군 오픈 라벨 연구입니다.

주요 평가변수는 활발한 출혈의 부재로 정의된 지혈까지의 시간입니다. 일차 안전성 변수는 30일 동안 주요 혈관 합병증이 발생한 것입니다. 이차 변수에는 보행 시간, 치료 실패 비율, 이상 반응 발생률, 전달 및 배치 중 기기 성능 특성이 포함되었습니다.

본 연구에 참여한 환자는 동의를 구할 수 있으며, 최소 1회의 온전한 페달 맥박이 있는 성인입니다. 다음 조건 중 하나라도 있는 환자는 연구에서 제외되었습니다.

- 말초혈관질환 병력이 있는 경우
- 자기 면역 질환이 있는 경우
- 중증 빈혈로 알려진 출혈 장애가 있는 경우
- INR >1.5의 경우
- 72시간 이내에 심근경색이 있었던 경우
- 치료에도 불구하고 조절되지 않는 고혈압이 있는 경우
- 셀딩거(Seldinger) 기술로 비만을 막은 경우
- 동맥 절개 부위에 혈관 이식물 또는 스텐트가 있는 경우
- 3개월 이내에 동측 천자가 발생한 경우
- 기대 수명이 6개월 이내인 경우

또한 다음 중 하나가 발견될 경우 환자를 수술 중 검사하고 연구에서 제외했습니다:

- 총 대퇴 동맥의 내강 직경 <5mm
- 천자 부위에 근접한 2cm 이내의 동맥 분지
- 천자 부위에 있는 3cm 이내의 유의미한 협착
- 사용한 1차 유도관이 >6Fr
- 대퇴 동맥 분기점 또는 분기점의 말단에 천자 존재
- 여러 개의 대퇴 동맥 천자 존재
- 후방 대퇴 벽 천자로 알려지거나 의심되는 경우
- 시술 완료 시 큰 혈종(2:6cm)이 있는 경우
- 조직 또는 혈관이 꼬여 시술을 위한 1차 도관 삽입이 어려운 경우

이 단일 프로토콜 연구는 두 부분으로 수행되었습니다. 20명의 환자를 파트 1에 등록한 후, 안전 분석을 완료하고, 이어서 추가 60명의 환자를 파트 2에 등록하였습니다.

파트 1에서 등록한 환자의 평균 나이는 65.9세이고 70.0%가 남성이었으며 95%는 병용 약물을 복용하고 있었습니다. 파트 2의 환자 평균 연령은 63.8세이고 78%는 남성이었으며 100%가 병용 약물을 복용하고 있었습니다.

진단(파트 1 및 파트 2) 또는 중재(파트 2) 심장 카테터 삽입 시술을 받는 환자는 이 연구에 등록할 자격이 있습니다. 이 시술은 각 등록 병원에서 표준 치료에 순응한 후 FemoSeal™ VCS를 사용했습니다. 환자 데이터는 시술 중 및 시술 후 1일 및 30일에 기준으로 수집되었습니다. 결과가 표 1.5에 요약되어 있으며 FemoSeal™ VCS가 이 환자 모집단에서 사용하기에 안전하고 효과적임을 나타냅니다.

표 1.5 시판 전 연구에서 보고된 임상 결과

|                                      | 파트 1   | 파트 2               |
|--------------------------------------|--------|--------------------|
| 환자 수                                 | 20     | 60                 |
| 평균 지혈 시간                             | 1.2분   | 1.6분 <sup>a</sup>  |
| 보행까지 평균 시간                           | 72.2분  | 87.5분 <sup>b</sup> |
| 주요 혈관 합병증의 발병률 <sup>c</sup>          | 0(0%)  | 1(2%)              |
| 이상반응이 있는 환자 수                        | 5(25%) | 19(32%)            |
| 치료 실패(주요 혈관 합병증, 수동 압박의 필요성, 또는 둘 다) | 0(0%)  | 3(5%)              |
| 기기의 오작동                              | 0(0%)  | 6(10%)             |

<sup>a</sup>2명의 환자가 이전의 동측 천자로 인해 시술 시점에 지혈이 안 됐기 때문에 총 표본 크기 58을 기준으로 함. 이 환자들은 7분 및 37분에 지혈이 이루어졌음.

<sup>b</sup>총 표본 크기 59명 기준: 환자 1명은 폐부종으로 인해 인공호흡기를 착용했고 1주일 이상 보행할 수 없어서 포함되지 않았습니다.

<sup>c</sup>수혈 또는 외과적 수복이 필요한 혈관 합병증 또는 항생제 투여, 입원이나 입원 연장, 또는 부위 피사조직 제거가 필요한 국소 감염으로 정의됨

본 연구의 파트 1에서는 주요 혈관 합병증이 관찰되지 않았습니다. 본 연구의 파트 2에서는 시술 후 1일 이내에 보고된 가성 동맥류와 같은 1건의 주요 혈관 합병증이 보고되었습니다. 그 결과 초음파 유도 압박과 가성 동맥류에 트롬빈 주입이 필요했고 환자의 입원이 연장되었습니다.

본 연구 파트 1에서 보고된 5건의 이상 반응 중, 기기와 관련될 수 있는 이상 반응 1건이 있었습니다. 이는 시술 후 1일 차에 심각하지 않은 급격한 출혈 증상이었습니다. 본 연구의 파트 2에서 보고된 19건의 이상반응 중 3건의 장치 관련 혈종의 심각하지 않은 이상 반응이 있었으며, 6건의 장치 관련 비중증 이상 반응이 관찰되었는데 여기에는 지속적 삼출 3건, 혈종 2건 및 운동 후 다리 통증 1건이 있습니다.

파트 2에서는 3명의 환자가 치료 실패로 간주되었습니다. 2명은 압박을 사용하지 않아 지혈을 달성하지 못했으며, 1명은 주요 혈관 합병증(가성 동맥류)으로 인한 것이었습니다. 본 연구의 파트 1에서는 치료 실패가 없었습니다.

본 연구의 파트 2에서 6건의 장치 오작동 중 3건은 시술에 방해되지 않았고, 사용자 오류 1건, 유도관 누출 1건 및 필라멘트 접합부 파손 1건이었습니다. 마지막 두 건은 C11202에서 구현된 모델 업데이트로 해결되었습니다.

시판 전 임상 연구에서 파트 2는 환자의 치료 지시 불이행으로 인해 6개월 추적관찰 결과를 보고하지 않았습니니다. 임상 문헌의 추적관찰 기간과 일치하는 시판 전 임상 연구(EU-SE-001) 30일 결과는 FemoSeal™ VCS가 안전하고 효과적임을 입증합니다.

#### 1.4.2 시판 후 임상 연구의 데이터 요약

완료된 시판 후 임상 연구 4건이 아래 표 1.6에 설명되어 있습니다. 이러한 임상 시험은 온라인에서 공개되거나 제공되지 않습니다.

표 1.6 시판 후 임상 연구

| 시판 후 임상 연구 완료                                                                               |                                                           |                          |                                                                                                                                                                                                                                              |                                                                                                                                                                |                                                                         |

|--|--|--|--|--|----------------------------------------------------------------------------------------------------------------------------------------------------------|

2006년 연구는 전달 시스템이 개선된 현재 기기의 안전성과 유효성을 확인하고 FemoSeal™ VCS IFU 및 교육 프로그램에 대한 피드백을 얻기 위해 수행되었습니다. 이 연구는 100명의 환자를 대상으로 했으며 일차 평가변수는 지혈이 되었는지 여부 또는 추가적인 수동 또는 기계적 압박이 필요한지 여부였습니다. 이 연구는 FemoSeal™ VCS의 적용이 대부분 사례에서 성공적이었다는 결론을 내렸습니다(91%는 즉각적으로 지혈되었습니다).

2008년 연구에서는 환자 50명이 등록되어 7 Fr 도관으로 심장 카테터 삽입을 받은 환자에서 FemoSeal™ VCS가 정상적인 임상 절차 중에 사용되었을 때 FemoSeal™ VCS의 안전성과 성능을 평가했습니다. 본 연구의 일차 평가변수는 추가적인 압박, 즉, 수동 또는 기계적 압박 없이 지혈까지의 시간 및 보행까지의 시간에 대한 데이터를 수집하는 것입니다. 연구 결과에 따르면 평균 지혈 시간은 57.8초였고 모든 환자는 4시간의 침대 휴식 후에 보행을 했습니다.

2009년 연구는 새로운 FemoSeal™ VCS 포장을 평가하는 것이었습니다. 25명의 환자가 이 연구에 등록되었습니다. 일차 평가변수는 사용자가 포장으로 문제를 겪었는지였습니다. 사용자는 새로운 FemoSeal™ VCS 포장과 관련하여 아무런 문제가 없다고 했습니다. 이 연구는 또한 지혈 시간 동안 데이터를 수집했습니다.

2022년 연구는 경피 혈관 내 시술받는 실제 대상에서 총 대퇴 동맥(CFA) 접근 부위의 지혈에 있어 FemoSeal VCS의 안전성과 유효성 데이터를 수집하기 위함입니다. 230명의 환자가 이 연구에 등록되었습니다. 등록의 일차 평가변수는 시술 성공(예: 성공적인 천자 부위 지혈)과 주요 합병증(예: 혈관 손상, 접근 부위 관련 출혈, 접근 부위 감염, 반복적인 수동 압박 및 새로운 접근 부위 관련 동측 급성 다리 허혈)의 감소입니다. 이 연구는 FemoSeal™ VCS가 실제 환경에서 잘 작동하며 말초 혈관 내 시술을 받는 환자에게 효과적인 지혈과 낮은 비율의 접근 부위 합병증을 나타낸다는 결론을 내렸습니다. 이

연구는 지혈까지의 짧은 시간과 우수한 작업자 사용성 피드백을 통해 우수한 성능을 입증했으며, FemoSeal™ VCS는 대퇴골 접근 봉합에 있어 귀중한 장치로 평가되었습니다.

### 1.4.3 시판 후 임상 추적관찰의 데이터 요약

#### 1.4.3.1 완료된 시판 후 임상 추적관찰

완료된 시판 후 임상 추적관찰 활동의 요약은 하기 표 1.7에 기재되어 있습니다.

표 1.7. 시판 후 임상 추적관찰 활동

Terumo Medical Corporation은 현재 보고 기간(2019년 9월 1일 - 2024년 8월 31일)에 3건의 의사 사용자 고품질 설문조사를 완료했습니다.

FemoSeal™ Clinical Surveys는 임상 사용 중 FemoSeal™ VCS의 안전성 및 성능과 관련하여 사전 예방적 임상 데이터를 수집했습니다. 이 설문 조사에는 전체 장치와 0.038" 가이드와이어를 비롯한 관련 액세서리 및 이들의 직접적인 상호작용에 초점을 맞춘 질문이 포함되었습니다. 가이드와이어 임상 설문조사에서는 FemoSeal™ VCS와 함께

제공되는 0.038" 가이드와이어를 임상적으로 사용하는 동안 안전성 및 성능과 관련하여 사전 예방적 임상 데이터를 수집했습니다. 본 설문 조사 질문은 특히 가이드와이어의 일반적인 사용에 초점을 맞추었으며, 가이드 와이어는 시술용 도관을 통해 혈관 구조에 삽입되는 것부터 와이어 제거에 이르기까지 다양합니다.

기기에 포함된 FemoSeal™ VCS 및 0.038" 가이드와이어는 모든 허용 등급을 받았으며 고품질 임상 조사에서 받은 의견 평가에 기초하여 장치에 대해 6건의 불만이 제기되었으며 가이드와이어에 대해 9건의 불만이 제기되었습니다. 불만 사항은 FemoSeal 및 가이드와이어 모두에 대해 평가되었으며 테루모 시판 후 감시 프로세스의 일부로 평가되었습니다. 확인된 새로운 위험 및/또는 위험 수준이 없었습니다.

PMCF 활동의 일환으로 2024년에 의사 사용자 설문조사가 완료되었습니다. 설문조사 결과 FemoSeal™ VCS 성능 등급 및 안전성이 전반적으로 매우 긍정적인 것으로 나타났습니다. FemoSeal™ VCS와 함께 제공된 하나의 표준 이외의 다른 가이드와이어의 호환성도 입증되었습니다.

#### 1.4.3.2 진행 중/계획된 시판 후 임상 추적관찰

TMC에는 2개의 진행 중/계획된 시판 후 임상 추적관찰 활동이 있습니다. EU 시장에서 FemoSeal VCS가 배포한 가이드와이어 사용 관련 피드백을 전향적으로 수집하기 위해 임상 설문 조사가 완료될 것입니다. 의사가 시술 중에 어떤 가이드와이어를 사용했는지 조사하고자 본 설문 조사를 실시합니다. 이 설문조사의 목적은 FemoSeal™ VCS와 Terumo가 아닌 다른 브랜드의 가이드와이어의 호환성에 대한 문헌 및 외부 검토자의 의견 부족으로 확인된 격차를 해결하는 것입니다. 피드백에는 다양한 가이드와이어가 있는 장치의 성능과 관련된 기술적 결과, 임상 성능 및 안전성이 포함됩니다.

#### 1.4.4 체계적인 문헌 검토의 데이터 요약

Terumo Medical Corporation은 Angio-Seal™ VIP Vascular Closure 기기 및/또는 이와 유사한 기기에 대해 공개된 시험에서 얻은 임상 안전성 및 성능 데이터를 수집하고 평가하기 위해 체계적인 문헌 검토를 수행합니다. 매년 간행되는 문헌을 심사하는 목적은 알려지지 않은 부작용을 식별하고, 알려진 부작용을 모니터링하며, 응급 위험을 식별하고 FemoSeal™ VCS의 체계적인 오용 또는 오프 라벨 사용을 식별하는 것입니다.

2019년 9월 1일부터 2024년 8월 31일까지 기간을 포함하는 가장 최근의 체계적 문헌 검토는 FemoSeal™ VCS에 대한 임상 안전성 및 성능 데이터를 제공하는 12건의 공개된 시험을 확인하였습니다. 23건의 참고문헌에서 FemoSeal™ VCS의 온 라벨 사용이 보고되었으며 9건의 연구에서 오프 라벨 사용이 보고되었습니다. 전체적으로 FemoSeal™ VCS 사용에 대해 특정된 연구의 문헌 검토는 경피 혈관 카테터 삽입 시술을 받는 EU 내

환자를 대표하는 연구의 모집단을 보여줍니다. 이 23개의 온 라벨 상호 검토 간행물 목록은 **섹션 3**을 참조하십시오.

임상 성능은 다음의 측정으로 평가했습니다.

- 지혈까지의 시간은 일반 경피적 대퇴동맥 봉합을 위한 최신 기술보다 낮거나 이와 비슷합니다.
- 보행까지의 시간은 일반 대퇴동맥의 경피적 봉합을 위한 최신 기술보다 낮거나 이와 비슷합니다.
- 수술 후 합병증 비율은 현재의 표준 치료보다 비슷하거나 낮습니다.

이러한 임상 성능 측정을 토대로, 본 문헌 검토의 데이터는 FemoSeal™ VCS가 7Fr 이하의 시술용 도관을 사용하여 경피 카테터 삽입을 받은 환자에서 대퇴 동맥 천자(동맥 절개술)를 지혈하는 데 성공적으로 사용될 수 있음을 보여주었습니다. 대부분의 환자(79.65~100%)에서 완전한 지혈이 이루어졌으며 지혈까지의 중간 시간은 0.5분, 퇴원까지의 평균 시간은 3일이었습니다. 69.2~86.7%의 환자가 수술 종료 후 5시간이 지난 후 보행할 수 있었으며, 수술 후 평균 침상 안정 시간은 349분이었습니다. FemoSeal™ VCS 실패는 3.68~4%의 경우에서 관찰되었으며, 0.9~4.4%의 시술에서 추가적인 수동 압박이 필요했습니다.

임상 안전성은 다음과 같은 이상 반응에 의해 평가되었습니다:

- 출혈
- 혈종
- 가성 동맥류
- 타박상
- 동정맥루
- 감염 증상
- 사망

이러한 이상반응과 관련하여 포함된 연구에서 FemoSeal™ VCS에 대해 보고된 발생률은 수동 압박 및 기타 혈관 지혈 장치와 관련하여 지금까지 보고된 비율보다 낮거나 비슷했습니다.

새로운 위험, 예상하지 못한 위험, 새롭게 부상한 위험 또는 용인할 수 없는 위험이 확인되지 않았기 때문에 10건의 사례 보고서 검토에서 이상반응이 확인되지 않았습니다.

진단 혈관조영술 또는 중재 수술 중 FemoSeal™ VCS 사용의 전반적인 효과는 성별, 연령, 환자 해부학적 구조, 동반 질환, 천자 부위의 해부학적 배치, 외과의사의 경험, VCD 배치 방법, 수술 후 관리 등과 같은 여러 요인에 따라 달라집니다. 지혈 달성을 포함한 기술적 성공 외에도 FemoSeal™ VCS는 지혈까지의 시간 단축, 보행까지의 시간 단축과 같은 대퇴 동맥 천자 후 혈관 봉합과 관련된 임상적 이점을 제공했습니다. FemoSeal™ VCS에 대한 성능 결과는 의도된 대로 사용될 때 이러한 유형의 장치에 대해 예상되는 성능 결과와 일치합니다. 현재 검색 기간 동안 검색된 참고 자료 중 일부는 공통 대퇴 동맥 이외의 해부학적 위치에서 대상 기기를 사용하고 오프 라벨로 간주되는 동맥절개술 > 7 Fr의 봉합을 위해 사용한 것으로 나타났습니다.

검토 중에 알려지지 않은 부작용, 발생 위험 또는 장치의 체계적인 오용 가능성은 확인되지 않았습니다. 그러나 FemoSeal™ VCS를 숙련된 의사가 조심스럽게 사용하는 경우 의료 장치는 유용한 필수 임상 장치로 효과를 발휘합니다. 전반적으로, 표적 요법 및 FemoSeal™ VCS는 현재 혈관 접근 관련 합병증 치료에 존재하는 임상적 필요를 해결합니다.

전반적으로, 본 문헌 검토의 데이터는 이전에 알려지지 않은 임상 환경에서의 성능 또는 안전성 문제, 또는 예상/허용 가능 비율보다 높은 비율로 발생한 이상 반응을 식별하지 않았습니다. 따라서, 이 문헌 검토를 통해 경피 카테터 삽입 후 동맥 절제술에서 지혈을 위한 압박 시 FemoSeal™ VCS를 사용할 경우 예상대로 계속 작동하며 심각한 안전 문제와 관련이 없다는 결론을 내릴 수 있습니다.

#### 1.4.5 시판 후 조사 데이터 요약

사전적 PMS 시스템을 마련하고 모든 불만 사항을 월 단위로 내부 제조 절차를 준수하여 검토합니다. 불만 데이터는 2019년 9월 1일부터 2024년 8월 31일까지의 기간 동안 분석되었습니다, 전체적으로 28건의 의료기기 감시(MDV) 보고서와 476건의 고객 불만 보고서가 제조업체에 제출되었습니다. 28건의 MDV 보고 중 27건은 이상 반응과 관련이 있었고 1건은 장치 오작동과 관련이 있었습니다. 보고 기간 동안 2건의 사망이 있었지만, 보고된 사망 중 대상 장치와 관련된 것으로 판단된 사망은 없었습니다. 제조업체에 제기된 476건의 불만사항 중 가장 일반적인 불만사항의 원인은 배치 어려움(146건 발생, 0.0142% 발생률)이었습니다. 빼기 모드의 고장 발생은 0.0126%(130건 발생)의 비율로 두 번째로 많이 발생했습니다.

FemoSeal 혈관 봉합기구는 전 세계적으로 1,030,136개 이상이 판매되었으며 유럽 경제 지역에서는 827,843개가 판매되었습니다. 글로벌 판매량 기준으로 산정된 불만 빈도는 0.046%입니다. 전반적인 고객 불만 비율은 매우 낮습니다. IFU 및 위험 문서에 포함되지 않은 새로운 위험이 확인되지 않았습니다.

바람직하지 않은 부작용에 대한 발생률은 표 1.2에 나와 있습니다. 불만사항 중 예기치 못하거나 새로 생겨나거나 허용되지 않는 새로운 위험은 확인되지 않았습니다. 알려진 바람직하지 않은 부작용의 빈도 또는 중증도에는 유의미한 증가가 없었습니다.

#### 1.4.6 임상 성능 및 안전성에 대한 전반적인 요약

FemoSeal™ VCS는 7F(2.33mm) 또는 더 작은 시술용 도관을 사용하여 경피적 카테터 삽입을 받은 환자의 총 대퇴 동맥 천자(동맥 절개술)를 지혈하는 데 사용됩니다. 이 임상 평가는 FemoSeal™ VCS의 용도와 관련된 시판 전 및 시판 후 임상 데이터 및 문헌에 대한 포괄적인 분석을 기반으로 합니다.

2019년 9월 1일부터 2024년 8월 31일까지의 기간에 걸쳐 발행된 문헌에 대한 포괄적인 검토가 수행되었습니다. 증거 문헌에는 FemoSeal™ VCS에 대한 29건의 연구가 포함되었습니다. 임상 평가에서 제공된 증거는 지시된 대로 사용될 때 대상 기기가 안전하고 효과적이며 정상적인 사용 조건 하에서 기기와 관련될 수 있는 모든 위험 또는 바람직하지 않은 부작용은 환자에 대한 이익과 비교할 때 허용 가능한 위험을 구성한다고 결론지었습니다. 대상 기기에 대한 성능 결과는 의도된 대로 사용될 때 이러한 유형의 장치에 대해 예상되는 성능 결과와 일치합니다.

FemoSeal™ VCS 사용과 관련하여 잠재적으로 바람직하지 않은 부작용에는 동맥 절개술 지혈의 대체 수단에서 흔히 보고되는 부작용이 있습니다(예: 출혈 및 혈종). 전반적으로 FemoSeal™ VCS 사용 시 보고된 부작용 발생률은 수동 압박 및 유사한 혈관 지혈 장치에서 보고된 발생률과 비슷합니다. 특히, 출혈 및 혈종의 경우 FemoSeal™ VCS에 대해 보고된 비율은 유사한 혈관 지혈 장치에 대해 보고된 비율보다 적습니다. 발표된 문헌과 시판 후 조사 모두에서 보고된 각각의 이상 반응은 이전에 확인되었습니다(섹션 1.3 참조).

FemoSeal™ VCS에 대한 임상 안전성 및 성능에 관한 기존 데이터에 따르면 사용 지침에 따라 이 혈관 봉합기구를 사용할 경우 환자가 얻을 수 있는 이점이 발생할 수 있는 위험보다 더 많습니다.

상기 이전 섹션에서 설명한 바와 같이, FemoSeal™ VCS에 대해 제공된 데이터는 평가 중인 기기와 관련된 데이터(예: 기기 사용, 안전성 결과, 임상 성능 및 임상 유익성)와 확인된 동급 기기와 최신 기술에 열거된 유사한 기기와 관련된 데이터 간의 일관성을 보여줍니다.

안전성 데이터의 교차 분석은 다음 간의 불일치를 식별하지 못했습니다.

- 최신 기술에서 언급된 데이터
- 평가 중인 기기에 특정한 데이터

- 위험 관리 파일에 언급된 데이터
- 라벨링 및/또는 IFU에 언급된 데이터(즉, 사용자에게 전달되는 잔여 위험성을 다름).

임상 안전성은 발표된 상호 심사 임상 문헌, 임상시험을 의뢰한 회사, 시장 철회 없이 연결된 시판 후 데이터의 검토에서 확인된 낮은 합병증률로 입증되었습니다. 성능에 대한 우려는 확인되지 않았으며, 검토된 문헌에는 제조업체의 사용 목적과 일치하는 FemoSeal™ VCS의 사용이 포함되었습니다.

## 1.5 가능한 진단 또는 치료 대안

수동 압박은 통상적으로 혈관 카테터 삽입 이후 동맥 절개술 부위의 지혈을 위해 사용됩니다. 수동 압박은 장시간 움직이지 못하고(시술 후 최대 8시간) 상당한 불편함이 있으며 입원 기간이 길어지는 환자들과 관련이 있었습니다. 최근의 체계적인 검토에 따르면 수동 압박으로 지혈하는 데 걸리는 중간값 시간은 20.8분이었습니다.<sup>1</sup>

수동 압박의 대안으로는 동맥 절개술 부위에 기계적 압박을 가하는 외부 지혈 기기가 있습니다. 이러한 장치는 지혈 시간 또는 보행 시간을 단축시키지 않지만, 수동 압박을 기계적 압박으로 대체함으로써 필요한 인력을 줄여줍니다. 기계적 압박 사용과 관련된 이상사례 비율은 수동 압박의 이상사례 비율과 비슷합니다.

FemoSeal™ VCS와 같은 혈관 봉합기구는 동맥 절개를 지혈하도록 고안되었습니다. 이 장치들은 지혈 시간을 단축하고 더 빠르게 보행하는 것을 목표로 합니다. 13개의 상용화된 기기를 포함하는 최근의 체계적인 검토에 따르면, 혈관 봉합 기기로 지혈하는 데 걸리는 중간값 시간은 5.4분이었습니다. 개별 혈관 봉합기구의 지혈에 걸리는 중위 시간은 1분(FemoSeal™ VCS)에서 14분 사이였으며, 대다수 장치는 4분에서 10분 사이였습니다.<sup>1</sup>

수동 압박, 외부 지혈 장치 또는 혈관 봉합기구와 함께 동맥 절개 부위 지혈과 관련하여 흔히 보고되는 이상 반응으로는 혈종, 접근 부위의 출혈, 가성 동맥류, 동정맥류 및 감염이 있습니다. 동일한 체계적인 문헌 고찰(34건의 무작위 대조 시험, 14,401명의 환자)에 따르면, 수동 압박과 혈관 봉합 장치의 사용 사이에서 부작용 발생률이 유사한 것으로 나타났으며, 단, 혈관 봉합 장치로 인해 출혈이 약간 증가하는 경향이 있었습니다.<sup>1</sup>

## 1.6 권장 사용자 프로필 및 교육

FemoSeal™ 혈관 봉합기구의 대상 사용자는 총 대퇴 동맥을 통한 혈관 내 시술에 대한 동맥 접근 및 지혈 수행 자격을 갖추었으며 테루모 메디컬 주식회사(Terumo Medical Corporation) FemoSeal™ 의사 교육 프로그램에 참여한 의사입니다.

## 1.7 관련 조화 및 공통 표준

| 표준 참조        | 현재 규정 준수 연도/개정 | 설명                                                                                                                                       |

Šis kopsavilkums par drošumu un klīnisko veikspēju (Summary of Safety and Clinical Performance — SSCP) ir paredzēts, lai sniegtu publisku piekļuvi atjauninātam kopsavilkumam par FemoSeal™ Vascular Closure System (VCS) drošuma un klīniskās veikspējas galvenajiem aspektiem.

Lietotājiem / veselības aprūpes speciālistiem paredzētais kopsavilkums par ierīces drošumu un klīnisko veikspēju ir sniegts tālāk **sadaļā 1.0**.

## **1.0 KOPSAVILKUMS LIETOTĀJIEM / VESELĪBAS APRŪPES SPECIĀLISTIEM**

Ar šo SSCP nav paredzēts aizstāt lietošanas instrukcijas kā galveno dokumentu, lai nodrošinātu, ka ierīce tiek lietota droši, kā arī nav paredzēts sniegt diagnostiskus vai terapeitiskus ieteikumus paredzētajiem lietotājiem vai pacientiem. Ar šo SSCP nav paredzēts aizstāt obligāto informāciju implantu kartēs vai jebkādos citos obligātajos dokumentos.

### **1.1 Ierīces paredzētais lietojums**

#### **1.1.1 Paredzētais lietojums**

FemoSeal™ Vascular Closure System ir medicīniska ierīce, kas paredzēta arteriālās punkcijas slēgšanai pēc perkutānās katetrizācijas, izmantojot kopējo augšstilba artēriju.

#### **1.1.2 Lietošanas indikācijas**

FemoSeal™ Vascular Closure System ir indicēta lietošanai parastās augšstilba artērijas punkcijas (arteriotomijas) slēgšanai pacientiem, kuriem veikta perkutāna katetrizācija, izmantojot 7F (2,33 mm) vai mazāku procedūras apvalku.

#### **1.1.3 Kontrindikācijas un/vai ierobežojumi**

FemoSeal™ Vascular Closure System ir kontrindicēta pacientiem ar arteriotomijām, kurās ir lietoti apvalki vai ierīces, kas lielākas par 7F (2,33 mm).

#### **1.1.4 Mērķa pacientu populācija**

Ir noteikts, ka FemoSeal™ Vascular Closure System ir droša un efektīva pacientiem, kuri sasnieguši vismaz 18 gadu vecumu un kuriem veikta perkutāna katetrizācija, izmantojot 7F (2,33 mm) vai mazāku procedūras apvalku.

#### **1.1.5 Īpašas pacientu populācijas**

FemoSeal™ Vascular Closure System drošums un efektivitāte nav noteikta šādām pacientu grupām:

- Pacienti ar iepriekš esošu autoimūnu slimību.
- Pacienti, kuriem tiek veikta terapeitiskā trombolīze.
- Pacienti ar klīniski nozīmīgu perifēro asinsvadu slimību.
- Pacienti ar nekontrolētu hipertensiju (sistoliskais spiediens > 220 mmHg vai diastoliskais spiediens > 110 mmHg).
- Pacientiem ar asiņošanas traucējumiem, tostarp trombocitopēniju (trombocītu skaits < 100 000) vai anēmiju (Hgb < 10 mg/dl).

- Pacienti, kuru kopējās augšstilba artērijas iekšējais lūmens ir mazāks par 5 mm.
- Pacienti ar nieru un/vai aknu darbības traucējumiem.
- Pacienti ar citu nozīmīgu blakuslimību.
- Iedzīvotāji ar specifisku rases un/vai etnisko piederību.
- Pacienti ar miokarda infarktu pēdējo 72 stundu laikā.
- Pacienti ar asinsvadu transplantātu vai stentu punkcijas vietā.
- Grūtnieces vai patientes, kuras baro bērnu ar krūti.
- pacientiem, kas jaunāki par 18 gadiem.

### 1.1.6 Paredzētie lietotāji

FemoSeal™ Vascular Closure System paredzētie lietotāji ir ārsti, kuri ir apmācīti, lai viņi varētu veikt arteriālo piekļuvi un slēgšanu endovaskulārajās procedūrās, izmantojot kopējo augšstilba artēriju, un ir piedalījušies Terumo Medical Corporation FemoSeal™ ārstu instruēšanas programmā.

## 1.2 Ierīces apraksts

### 1.2.1 Šīs ierīces apraksts

FemoSeal™ Vascular Closure System, ko ražo uzņēmums Terumo Medical Corporation (TMC), ir absorbējama asinsvadu slēgšanas ierīce, kas izstrādāta, lai panāktu augšstilba artērijas hemostāzi pēc perkutānās katetrizācijas, izmantojot kopējo augšstilba artēriju.

FemoSeal™ slēgšanas elementi sastāv no diviem absorbējamiem polimēru diskiem, iekšējā blīvējuma un ārējās bloķēšanas diska, kas tiek turēti kopā ar absorbējamu daudzšķiedru materiālu, tādējādi mehāniski noslēdzot arteriotomiju (sk. **attēlu 1.1** un **attēlu 1.2**). Pēc izvēršanas caur konusa korpusa apvalku ārējais bloķēšanas disks tiek uzspiests uz daudzšķiedru serdeņa, kā rezultātā punkcijas vieta tiek mehāniski noslēgta starp iekšējo un ārējo bloķēšanas disku. Iekšējais blīvējums un ārējais bloķēšanas disks tiek turēti vietā ar berzi uz daudzšķiedru serdeņa. Hemostāzi panāk ar mehāniskiem līdzekļiem. Noslēgšanas elementi tiek noārdīti hidrolīzes rezultātā.

Implantējamie slēgšanas komponenti, iekšējais blīvējums un ārējais bloķēšanas disks noārdās astoņpadsmit (18) mēnešu laikā, savukārt daudzšķiedru materiāls noārdās un tiek absorbēts hidrolīzes rezultātā apkārtējos audos pēc diviem (2) līdz trim (3) gadiem. Implantējamo slēgšanas komponentu spēja saglabāt kompresiju arteriotomijā ir testēta līdz astoņām (8) stundām. Noārdšanās produkti metabolizējas un izdalās ar urīnu vai tiek izelpoti kā oglekļa dioksīds caur

plaušām. Pētījumos ar dzīvniekiem nav novērota uzkrāšanās ietekme. FemoSeal™ papildu komponenti, kas procedūras laikā nonāks saskarē ar dzīvajiem audiem vai asinīm, ir konusa korpusa apvalks, dilatators, bļietēšanas caurulīte, stūmējs un vadītājstīga.

**Attēls 1.1. Attiecīgi iekšējais blīvējums un ārējais bloķēšanas disks**

**Attēls 1.2. Iekšējā blīvējuma un ārējā bloķēšanas diska izvietošana**

FemoSeal™ bloks ir iepakots kopā ar dilatatoru un 0,038 collu (0,97 mm) OD, 27,5 collu (70 cm) garu vadītājstīgu un J taisnotāju; sk. tālāk **attēlu 1.3**. Vadītājstīga atrodas polietilēna caurulē. Visas daļas ir iepakotas fiksētā papīra paplātē. Iepakojumā ir arī pacienta implanta karte. FemoSeal™ Vascular Closure System, lai tā darbotos, kā paredzēts, nav nepieciešami papildu piederumi, un tā ir paredzēta lietošanai tikai ar dilatatoru un vadītājstīgu, kas iekļauta šī izstrādājuma iepakojumā.

\* Implantējamā ierīces daļa; implantējamie komponenti ir MR attēlveidošanas droši

FemoSeal™ VCS ir sterilizēta, izmantojot etilēna oksīdu (EO), un tā ir vienreizējai lietošanai paredzēta medicīniska ierīce. FemoSeal™ VCS ir veidota tā, lai to nevarētu izmantot atkārtoti.

### **Darbības veids**

FemoSeal™ VCS veicina mehānisku hemostāzi, izvietojot implantējamus slēgšanas elementus kopējā augšstilba artērijā un ārpus tās. Mehānismu, kas novērš asiņošanu, nodrošina iekšējais blīvējums, kas noblīvē punkcijas vietu, un ārējais bloķēšanas disks, kas notur iekšējo blīvējumu vietā.

### **1.2.3 Klīniskais ieguvums**

FemoSeal™ VCS nodrošina šādus klīniskos ieguvumus, salīdzinot ar asinsvadu slēgšanu pēc parastas augšstilba artērijas punkcijas:

- Mazāks laiks līdz hemostāzei<sup>1</sup>
- Mazāks laiks līdz brīdim, kad pacients var patstāvīgi pārvietoties<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heinford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Iepriekšējā(-ās) paaudze(-es) vai varianti

- FemoSeal™ VCS (Nr. 11200) pirmā versija tika pārdota Eiropas tirgū 2005. un daļēji 2006. gadā.
- Pašreizējā ierīce FemoSeal™ VCS (Nr. 11202) ar uzlabotu piegādes sistēmu tirgū ir pieejama kopš 2006. gada 28. marta.

#### 1.2.5 Piederumi, kas paredzēti lietošanai kopā ar šo ierīci

FemoSeal™ bloks ir iepakots kopā ar dilatatoru, 0,038 collu (0,97 mm) OD, 27,5 collu (70 cm) garu vadītārstīgu un J taisnotāju. Vadītārstīga ir FemoSeal™ bloka piederums. J taisnotājs ir vadītārstīgas komponents, savukārt dilatators ir FemoSeal™ bloka komponents. Vadītārstīga ir vienīgais vērā ņemamais piederums. Vadītārstīga atrodas polietilēna caurulē. Visas daļas ir iepakotas fiksētā papīra paplātē. Iepakojumā ir arī pacienta implanta karte. FemoSeal™ Vascular Closure System, lai tā darbotos, kā paredzēts, nav nepieciešami papildu piederumi, un tā ir paredzēta lietošanai tikai ar dilatatoru un vadītārstīgu, kas iekļauta šī izstrādājuma iepakojumā.

#### 1.2.6 Citas ierīces un izstrādājumi, kas paredzēti lietošanai kopā ar šo ierīci

Lai FemoSeal™ VCS darbotos, kā paredzēts, nav nepieciešamas papildu ierīces.

### 1.3 Riski un brīdinājumi

#### 1.3.1 Atlikušie riski un nevēlamas iedarbības

Zināmi vai paredzami nevēlamie notikumi, kaitējums un komplikācijas, kas saistītas ar ierīces FemoSeal™ VCS lietošanu, kā atlikušais risks ir uzskaitītas **tabulā 1.2**. Notikumu biežuma pamatā ir riska analīzes dokumentācija un aprēķini, pamatojoties uz pēcpārdošanas uzraudzības datiem no 2019. gada 1. septembra līdz 2024. gada 31. augustam. FemoSeal™ VCS nav nezināmu atlikušo risku, un visi attiecīgie riski ir novērsti, izmantojot lietošanas instrukcijas un risku pārvaldības procesu.

**Tabula 1.2. FemoSeal nevēlamie notikumi/komplikācijas**

| Kaitējums                                            | Sastopamība (%) | Mazinošie faktori                                                                                                                                              |
|------------------------------------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 1.3.2 Brīdinājumi un piesardzības pasākumi

### Brīdinājumi

1. Nelietot, ja iepakojums ir bojāts vai ir bojāta sterilā barjera.
2. Nelietot pēc derīguma termiņa beigām — bioloģiski noārdāmie komponenti var pienācīgi nedarboties.
3. Nelietot, ja kādi priekšmeti izskatās bojāti vai ar kādiem defektiem.
4. Tādas FemoSeal™ Vascular Closure System lietošana, kurā var būt noticis bakteriāls procedūras apvalka vai apkārtējo audu piesārņojums, var izraisīt infekciju.
5. Ja ir aizdomas, ka aizmugurējā artērijas sienīņa ir pārdurta vai ir veikta vairāk nekā viena arteriālā punkcija, lai panāktu arteriālo hemostāzi, nepaļaujieties tikai uz FemoSeal™ Vascular Closure System vien. Izmantojiet papildu manuālo vai mehānisko kompresiju.
6. Ja punkcijas vieta atrodas augšstilba artērijā vai distālā virzienā no tās, FemoSeal™ Vascular Closure System nedrīkst lietot, jo pastāv risks, ka iekšējais blīvējums tiks novietots nepareizi. Šis notikums var izraisīt asiņošanas komplikācijas un/vai traucēt normālu asins plūsmu.
7. Ja incīzijas vietā ir nepārtraukta arteriāla asiņošana, nenogrieziet daudzšķiedru serdeni, līdz nav sasniegta hemostāze. Ja hemostāze netiek sasniegta, nostipriniet daudzšķiedru serdeni ar sterilu brūces pārsēju un nodrošiniet papildu kompresiju, līdz tiek sasniegta hemostāze. Nepārtrauktas arteriālās asiņošanas gadījumā var rasties ievērojamas asiņošanas komplikācijas, kas var izraisīt pacienta traumu vai nāvi.
8. Nelietojiet FemoSeal™ Vascular Closure System, ja punkcijas vieta ir proksimāla cirkšņa saitei, jo tas var izraisīt retroperitoneālu hematomu.
9. Pacientiem, kuriem ir augstāks asiņošanas risks, var rasties palielināts asins zudums un var būt nepieciešama asins pārliešana.
10. Ja iekšējais disks atdalās, tas var izraisīt trombotisku un/vai embolisku notikumu.

### Piesardzības pasākumi

1. FemoSeal™ Vascular Closure System izvietojšanas procedūra jāveic ārstiem, kas ir atbilstoši apmācīti par šīs ierīces lietošanu.
2. Pirms FemoSeal™ Vascular Closure System izvietojšanas veiciet ierobežotu femorālo angiogrammu vai ar ultraskaņu vadītu femorālo punkciju.
3. Pārtrauciet procedūru, ja:
  - kopējās augšstilba artērijas lūmena diametrs < 5 mm;

- parastās augšstilba artērijas punkcijas vietas tuvumā ir stenoze un/vai nozīmīgs iekaisuma plankums;
  - arteriālā punkcija ir augšstilba artērijas bifurkācijas vietā vai distāli no tās;
  - parastās augšstilba artērijas punkcijas vietas tuvumā ir anomāli atzarojumi vai asinsvadu anomālijas.
4. Ja ir kāda hematoma, lai konusa korpusa apvalku pareizi ievietotu artērijā, ir jāievēro īpaša piesardzība.
  5. Izmantojiet vienas sieniņas punkcijas metodi. Nepārduriet artērijas aizmugurējo sieniņu.
  6. Lietojot FemoSeal™ Vascular Closure System, vienmēr ievērojiet sterilitāti.
  7. FemoSeal™ Vascular Closure System ir paredzēta tikai vienreizējai lietošanai, un to nekādā veidā nedrīkst sterilizēt vai lietot atkārtoti. FemoSeal™ bloks ir veidots tā, lai to nevarētu izmantot atkārtoti.
  8. Ja iekšējā blīvējuma izvietošanas laikā ir jūtama neparedzēta pretestība, pārtrauciet procedūru.
  9. Lai pareizi izvietotu iekšējo blīvējumu, pārvietojiet īkšķi tā, lai poga varētu brīvi atlēkt atpakaļ.
  10. Pirms ārējā bloķēšanas diska izvietošanas pārliecinieties, vai FemoSeal™ bloka konusa korpusa apvalka gals atrodas zem ādas. Pacienti, kuriem ir neliels attālums starp femorālo artēriju un ādas līmeni, ārējais bloķēšanas disks var nejauši tikt izvietots virs ādas.
  11. Lai varētu ievietot pareizi, pirms ievietošanas var būt nepieciešams veikt iegriezumu ādā.
  12. Ja iekšējais blīvējums atrodas artērijā, bet nevar pilnībā nospiest pogu un izvietot ārējo bloķēšanas disku, var būt nepieciešama operācija, lai izņemtu FemoSeal™ slēgšanas elementus.
  13. Ja 18 mēnešu laikā ir nepieciešama atkārtota vienas un tās pašas augšstilba artērijas punkcija, atkārtota punkcija ir jāveic vismaz vienu centimetru proksimāli no iepriekšējās FemoSeal™ Vascular Closure System piekļuves vietas.
  14. Uzdodiet pacientam ievērot ārsta norādījumus par slēgšanas vietas pārbaudi.
  15. Norādiet pacientam nākamos 18 mēnešus nēsāt līdz pacienta informācijas karti

### **Piesardzības pasākumi izrakstīšanas laikā**

Pirms apsverat izrakstīšanu, novērtējiet šādus pacienta klīniskos apstākļus:

1. Asiņošana un/vai hematoma slēgšanas vietā.
2. Sāpes staigājot.
3. Infekcijas pazīmes slēgšanas vietā.

### 1.3.3 Drošības korigējošās darbības

Laika posmā no 2019. gada 1. septembra līdz 2024. gada 31. augustam tika veikta viena ar FemoSeal™ VCS saistīta drošības korigējošā darbība.

2022. gadā Terumo brīvprātīgi atsauca FemoSeal™ VCS, pamatojoties uz sūdzībām par kļūmēm Elkton ražotā FemoSeal produkta blietēšanas spēka mērīšanas un atvilkšanas spēka procesa un partijas izlaišanas testos. Kopumā tika atsaukti 950 bloki no Dienvidkorejas.

## 1.4 Klīniskais izvērtējums un pēcpārdošanas klīniskā novērošana

**1.3. tabulā** ir saraksts, kurā norādīti rakurspētījumi, kas veikti, laižot FemoSeal™ VCS tirgū, kā arī pēcpārdošanas pētījumi un pēcpārdošanas klīniskās novērošanas pasākumi. Pētījumā izmantotā ierīces versija ir iekļauta tālāk esošajā tabulā. FemoSeal™ VCS (Nr. 11200) pirmā versija bija pieejama tirgū līdz 2006. gadam, bet nākamā versija (Nr. C11202) tirgū tika laista 2006. gadā un ir pašlaik tirgū pieejamā versija.

### 1.3. tabula. Rakurspētījumu kopsavilkums

| Pirmspārdošanas funkcionālā testēšana ar dzīvniekiem                                                                                                                                                                                                                    | Ierīces versija               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vasculature System. Functional Implantation Test in Sheep 12-, 15-, and 18-month Time Periods. (R1051-1), 2000, Radi Medical System AB (performed by Biomatech, France). | 11200                         |
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep 12-, 24-, and 36-Week Time-Periods. (R1050-1), 2002, Radi Medical System AB (performed by Biomatech, France). | 11200                         |
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).         | 11200                         |

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002</p> <p>Radi Medical System AB</p> <p>Veica Biomatech, Francija</p> | <p>Pētījums ar dzīvniekiem</p> | <p>Pētījuma nolūks bija novērtēt tāda bionoārdamā implanta bioloģisko saderību un biofunktionalitāti, kas izstrādāts, lai panāktu hemostāzi asinsvadu sistēmā. Pārbaudītā ierīce bija paredzēta iekļūšanai artērijā pa punkcijas caurumu, lai panāktu hemostāzi. Viens disks tika ievadīts artērijā pa punkcijas caurumu, bet otrs nostiprināja iekšējo disku no artērijas ārpuses. Abi diski tika ievietoti caur ievadslūžas apvalku. Diski tika izstrādāti, lai novērstu asiņošanu, ieaugtu asinsvada sienā un visbeidzot noārdītos un uzsūktos. Pētījums bija paredzēts, lai savāktu un analizētu datus pēc funkcionālās implantācijas aitām un cūkām, lai novērtētu implanta spēju uzturēt fizioloģisko funkciju, ja to izmanto asinsrites sistēmā, lai noteiktu saimniekorganisma reakciju un ierīces reakciju (fizisko integritāti, audu iekapsulēšanos nokaušanas brīdī) un lai novērtētu implanta noārdīšanos</p> | <p>Implantācijas periods/novērošana visiem dzīvniekiem ir 5 nedēļas</p> <p>4 aitas, 1 cūka</p> <p>14 slēgšanas elementi</p> <p>8 slēgšanas elementi, kas implantēti 2 aitām,</p> <p>2 slēgšanas elementi, kas implantēti 1 cūkai</p> <p>Kad divi slēgšanas elementi tika implantēti vienā un tajā pašā augšstilba artērijā, tie tika implantēti attālumā &gt; 30 mm</p> | <p>Tika reģistrēti jebkādi nevēlamu pazīmju kritēriji (iekaisums, nekroze, asiņošana vai jebkādi citi bojājumi) vai jebkāda plāna pseidoīntīmas slāņa veidošanās. Īpaša uzmanība tika pievērsta ierīces sākotnējai integrācijai audos ar uzsvāru uz iekšējā diska iekapsulēšanos.</p> <p>Makroskopiski netika novērotas būtiskas lokālas nepanesības vai trombu veidošanās pazīmes. Makroskopiskā novērošana neatklāja nekādas atšķirības starp aitām vai cūku pēc augšstilba artērijās esošo slēgšanas elementu implantācijas.</p> <p>Makroskopiski netika novērotas būtiskas lokālas nepanesības vai trombu veidošanās pazīmes. Makroskopiskā novērošana neatklāja nekādas atšķirības starp aitām vai cūku pēc augšstilba artērijās esošo slēgšanas elementu implantācijas.</p> <p>Implantācijas vietas histopatoloģiskā analīze aitām neuzrādīja lokālas blakusparādības. Iekšējie un ārējie diski uzrādīja noārdīšanās pazīmes un dažos gadījumos bija salīzuši mazākās daļās. Iekšējie diski bija pilnībā integrēti jaunizveidotajos audos. Cūkai histopatoloģiskā analīze uzrādīja nelielu vairāk iekaisuma pazīmju ap</p> |

Abu veidu dzīvniekiem daudzšķiedru serdenis uzrādīja nedaudz vairāk iekaisuma pazīmju nekā diska materiālā, kas ir normāli pītiem šuves diegiem lielākas virsmas platības dēļ.</p> <p>Asinsvada caurlaidība tika mērīta pēc 5 nedēļām, izmantojot trīs dažādas metodes, histomorfometrisko, histomorfometrisko kombinācijā ar asinsvada diametra mērīšanu, izmantojot bīdmēru un izmantojot krāsu doplera ultrasonogrāfiju. Vidējā asinsvadu caurlaidība aitām bija no 60 līdz 80% atkarībā no metodes (12 novērojumi). Cūkai vidējais asinsvadu caurlaidības līmenis bija no 40% līdz 80% (2 novērojumi).</p> |

FemoSeal™ VCS pirmaspārdošanas attīstības plāna ietvaros tika veikti 3 funkcionālie testi ar dzīvniekiem. 2000. gadā pirms klīnisko pētījumu uzsākšanas tika veikts pētījums ar dzīvniekiem, lai novērtētu FemoSeal™ VCS biofunkcionalitāti. Šajā pētījumā tika novērtēta slēgšanas elementu spēja saglabāt fizioloģisko funkciju un novērtēta to noārdīšanās. Pēc 18 mēnešiem iekšējā un ārējā diska materiāls vairs nebija redzams, tas bija aizstāts ar endolumināliem

fibroziem audiem. Noslēgumā tika apstiprināta FemoSeal™ VCS noslēdzošā elementa spēja uzturēt fizioloģisko funkciju, ja to izmanto asinsrites sistēmā.

2002. gadā tika veikts pētījums, lai novērtētu bioloģiski noārdāma implanta FemoSeal™ VCS bioloģisko saderību un biofunktionalitāti, kas izstrādāts, lai panāktu hemostāzi asinsvadu sistēmā. Kopumā runājot, implanta noārdīšanās bija gandrīz pabeigta 36 nedēļās un nebija būtisku nevēlamu audu reakciju.

Citā pētījumā ar dzīvniekiem, kas tika veikts 2002. gadā, tika novērtēta tāda bionoārdāmā implanta FemoSeal™ VCS bioloģiskā saderība un biofunktionalitāte, kas izstrādāts, lai panāktu hemostāzi asinsvadu sistēmā. Pēc 5 nedēļām diska iekapsulēšana bija pabeigta un tika novērotas iekšējā un ārējā diska noārdīšanās pazīmes. Noslēgumā tika apstiprināta implanta spēja uzturēt fizioloģisko funkciju, ja to izmanto asinsrites sistēmā.

FemoSeal™ VCS klīniskās attīstības plāna ietvaros Radi Medical System AB veica pirmspārdošanas klīnisko pētījumu. Šis klīniskais pētījums nav publicēts vai pieejams tiešsaistē. Pētījums ar ierīces modeli nr. 11200 tika veikts 2002.–2004. gadā saskaņā ar Eiropas standartu EN 540 (Cilvēkiem paredzēto medicīnisko ierīču klīniskā izpēte) un saskaņā ar ICH vispārīgajiem apsvērumiem par klīniskajiem pētījumiem un labas klīniskās prakses vadlīnijām. Detalizēta informācija par šo pētījumu ir dokumentēta ziņojumā EU-SE-001. Šis klīniskais pētījums tika dokumentēts Radi Medical Systems AB beigu ziņojumā “Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures”. Šis klīniskais pētījums tika veikts ar FemoSeal™ pirmo modeli Nr. 11200, koncentrējoties uz implantējamo noslēgšanas komponentu drošumu un efektivitāti. Vienīgā atšķirība starp pirmo modeli Nr. 11200 un pašreizējo modeli C11202 ir izmērs pēc franču skalas — attiecīgi 6F un 7F – un uzlabota piegādes sistēma. Implantējamo noslēgšanas elementu, iekšējās blīves un ārējā bloķēšanas diska klīniskie ieguvumi, paredzētais lietojums, darbības principi un izejvielas paliek nemainīgi.

Ierīces paredzētais lietojums attiecas uz pacientiem, kam tiek veiktas diagnostiskas sirds vai invazīvas sirds procedūras, kā piekļuves punktu izmantojot augšstilba artēriju. Šī pētījuma mērķis bija noteikt FemoSeal™ VCS drošumu, veiktspēju un efektivitāti. Šis bija prospektīvs, vairāku centru, vienas grupas atklāts pētījums ar 30 dienu novērošanu.

Primārais veiktspējas mērķa kritērijs bija laiks hemostāzei, kas definēta kā straujas asiņošanas trūkums. Primārais drošības mērķa kritērijs bija lielu asinsvadu komplikāciju rašanās 30 dienu laikā. Sekundārie mērķa kritēriji ietvēra laiku līdz brīdim, kad pacients var patstāvīgi pārvietoties, ārstēšanas neveiksmju īpatsvaru, nevēlamu notikumu biežumu un ierīces veiktspējas raksturlielumus piegādes un izvietošanas laikā.

Šajā pētījumā iekļautie pacienti bija pieaugušie, kas varēja sniegt informētu piekrišanu un ar vismaz vienu neskartu apakšējo ekstremitāšu pulsu. Pacienti tika izslēgti no pētījuma, ja viņiem bija kāds no šiem nosacījumiem:

- perifēro asinsvadu slimību vēsture;
- autoimūna saslimšana;
- zināmi smagas anēmijas izraisīti asiņošanas traucējumi;
- INR >1,5;
- miokarda infarkts pēdējo 72 stundu laikā;
- nekontrolēta hipertensija, neskatoties uz ārstēšanu;
- aptaukošanās, kas izslēdz piekļuvi Seldingera tehnikai;
- asinsvadu transplantāta vai stenta klātbūtne arteriotomijas vietā;
- iepriekšēja ipsilaterāla punkcija pēdējo 3 mēnešu laikā;
- paredzamais mūža ilgums < 6 mēneši.

Turklāt pacienti tika izmeklēti operācijas laikā un izslēgti no pētījuma, ja tika novērota kāda no šīm pazīmēm:

- kopējās augšstilba artērijas lūmena diametrs <5 mm;
- arteriālie atzarojumi 2 cm attālumā proksimāli no punkcijas vietas;
- būtiska stenoze 3 cm attālumā no punkcijas vietas;
- primārā ievadslūžas apvalka lietošana >6 Fr;
- punkcija augšstilba artērijas bifurkācijas vietā vai distālajā daļā;
- vairākas augšstilba artērijas punkcijas;
- zināma vai iespējama augšstilba artērijas aizmugurējās sienas pārduršana;
- liela hematoma (2:6 cm) procedūras beigās;
- grūti ievadāma primārā apvalka procedūra likumotu audu vai asinsvada dēļ.

Šis vienprotokola pētījums tika veikts divās daļās: 1. daļā tika uzņemti 20 pacienti, pēc tam tika pabeigta drošības analīze, un pēc tam 2. daļā tika uzņemti vēl 60 pacienti.

1. daļā vidējais uzņemto pacientu vecums bija 65,9 gadi, 70,0% pacientu bija vīrieši un 95% pacientu līdztekus lietoja medikamentus. Pētījuma 2. daļā vidējais vecums bija 63,8 gadi, 78% bija vīrieši un 100% līdztekus lietoja medikamentus.

Pacientiem, kuriem veic diagnostiku (1. daļa un 2. daļa) vai invazīvās (2. daļa) sirds katetrizācijas procedūras, bija tiesības pretendēt uz uzņemšanu pētījumā. Šīs procedūras atbilda aprūpes standartam katrā iesaistītajā slimnīcā, kam sekoja FemoSeal™ VCS lietošana. Pacienta dati tika vākti sākumā, procedūras laikā, kā arī 1 dienu un 30 dienas pēc procedūras. Rezultāti ir

apkopoti **1.5. tabulā** un norāda, ka ierīce FemoSeal™ VCS ir droša un efektīva lietošanai šajā pacientu populācijā.

**Tabula 1.5. Pirmspārdošanas pētījumā paziņotie klīniskie rezultāti**

| Pacientu skaits ar nevēlamajiem notikumiem                                                                              | 5 (25%)      | 19 (32%)                  |
| Ārstēšanas kļūme (definēta kā lielas asinsvadu komplikācijas, nepieciešamība pēc manuālas kompresijas vai abi gadījumi) | 0 (0%)       | 3 (5%)                    |
| Ierīces darbības traucējumi                                                                                             | 0 (0%)       | 6 (10%)                   |

<sup>a</sup> Pamatojoties uz kopējo parauga lielumu 58, jo iepriekšējo ipsilaterālo punkciju dēļ 2 pacienti procedūras laikā nerasniedza hemostāzi. Hemostāze šiem pacientiem tika sasniegta 7 minūtēs un 37 minūtēs.

<sup>b</sup> Pamatojoties uz kopējo parauga lielumu 59: 1 pacients netika iekļauts, jo tas tika pieslēgts ventilēšanai plaušu tūskas dēļ un nespēja patstāvīgi pārvietoties vairāk nekā nedēļu.

<sup>c</sup> Definēta kā ar asinsvadiem saistītas komplikācijas, kas prasa asins pārliešanu vai ķirurģisku labošanu, vai lokāla infekcija, kam nepieciešama antibiotiku lietošana, hospitalizācija vai hospitalizācijas laika pagarināšana, vai brūces tīrīšana

Pētījuma 1. daļā netika novērotas lielas asinsvadu komplikācijas. Pētījuma 2. daļā tika ziņots par vienu būtisku asinsvadu komplikāciju: pseidoaneirismu, par kuru ziņots vienas dienas laikā pēc procedūras. Šajā gadījumā bija nepieciešama ultraskaņas vadīta kompresija un trombīna injekcija pseidoaneirismā un ilgāka pacienta hospitalizācija.

No 5 nevēlamajiem notikumiem, par ko ziņots pētījuma 1. daļā, bija 1, iespējams, ar ierīci saistīts nevēlamais notikums: nebūtisks straujas asiņošanas gadījums 1 dienu pēc procedūras. No 19 nevēlamajiem notikumiem, par ko ziņots pētījuma 2. daļā, tika novēroti 3 ar ierīci saistīti nebūtiski nevēlami hematomas notikumi, un tika novēroti 6, iespējams, ar ierīci saistīti nebūtiski

notikumi, tostarp 3 ziņojumi par pastāvīgu sūci, 2 hematomām un 1 kāju sāpju gadījumu pēc vingrināšanas.

2. daļā tiek uzskatīts, ka ārstēšana bijusi nesekmīga 3 pacientiem: 2 sakarā ar nepanāktu hemostāzi, neizmantojot kompresiju, un 1 sakarā ar nopietnu asinsvadu komplikāciju (pseidoaneirismu). Pētījuma 1. daļā nesekmīga ārstēšana netika konstatēta.

No sešiem ierīces darbības traucējumiem pētījuma 2. daļā trīs netraucēja procedūru, viens bija saistīts ar lietotāja kļūdu, viens bija ievadslūžas noplūde, un viens bija salauzta šķiedru serdeņa locīkla. Pēdējās divas problēmas tika risinātas, izmantojot modeļu atjauninājumus, kas ieviesti modelī C11202.

Pirmspārdošanas klīniskā pētījuma 2. daļā netika ziņots par 6 mēnešu novērošanas rezultātiem, kas radušies pacienta neatbilstības dēļ. Pirmspārdošanas klīniskā pētījuma (EU-SE-001) 30 dienu rezultāti, kas atbilst klīniskajā dokumentācijā minētajam novērošanas laika periodam, pierāda, ka FemoSeal™ VCS ir droša un efektīva.

#### 1.4.2 Pirmspārdošanas klīnisko pētījumu datu kopsavilkums

Tālāk redzamajā **1.6. tabulā** ir aprakstīti 4 pabeigti pēcpārdošanas klīniskie pētījumi. Šie klīniskie pētījumi nav publicēti vai pieejami tiešsaistē.

**1.6. tabula. Pēcpārdošanas klīniskie pētījumi**

| Pabeigti pēcpārdošanas klīniskie pētījumi                                                   |                              |                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                        |

|--|--|--|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

2006. gada pētījums tika veikts, lai apstiprinātu pašreizējās ierīces drošumu un efektivitāti ar uzlabotu piegādes sistēmu un saņemtu atgriezenisko saiti par FemoSeal™ VCS lietošanas instrukciju un apmācības programmu. Pētījumā tika iekļauti 100 pacienti, un primārais mērķa kritērijs bija tas, vai tika panākta hemostāze vai arī bija nepieciešama papildu manuāla vai mehāniska kompresija. Pētījumā secināts, ka lielākajā daļā gadījumu FemoSeal™ VCS lietošana bija sekmīga (91% panāca tūlītēju hemostāzi).

2008. gada pētījumā tika iekļauti 50 pacienti, lai novērtētu FemoSeal™ VCS drošumu un veikspēju, lietojot to parastās klīniskās rutīnas laikā pacientiem, kuriem tiek veikta sirds kateterizācija ar 7 Fr apvalku. Pētījuma primārais mērķa kritērijs bija apkopot datus par hemostāzi un laiku, līdz pacients var patstāvīgi staigāt bez papildu manuālas vai mehāniskas kompresijas. No pētījuma rezultātiem tika secināts, ka vidējais laiks līdz hemostāzei bija 57,8 sekundes, un visi pacienti spēja patstāvīgi staigāt pēc 4 stundu gultas režīma.

2009. gada pētījumā tika novērtēts jaunais FemoSeal™ VCS iepakojums. Pētījumā tika reģistrēti 25 pacienti. Primārais mērķa kritērijs bija tas, vai lietotājam radās problēmas ar iepakojumu.

Lietotāji neminēja nekādas problēmas saistībā ar jauno FemoSeal™ VCS iepakojumu. Šajā pētījumā tika apkopoti arī dati par laiku līdz hemostāzei.

2022. gada pētījuma mērķis bija perspektīvi ievākt datus par FemoSeal VCS drošumu un efektivitāti, lai panāktu kopējās augšstilba artērijas piekļuves vietu hemostāzi reāliem pacientiem, kam tiek veiktas perkutānas endovaskulāras procedūras. Pētījumā tika reģistrēti 230 pacienti. Primārie reģistra mērķa kritēriji ir procedūras sekmīgums (t.i., sekmīga punkcijas vietas hemostāze) un nozīmīgu komplikāciju (piem., asinsvadu traumu, asiņošanas piekļuves vietā, piekļuves vietas infekcijas, atkārtotas manuālas kompresijas un jaunu ar piekļuves vietu saistītas ipsilaterālas akūtas kāju išēmijas) samazināšana. Pētījumā secināts, ka FemoSeal™ VCS labi darbojas reālajā vidē un nodrošina efektīvu hemostāzi un zemu piekļuves vietas komplikāciju biežumu pacientiem, kuriem tiek veiktas perifērās endovaskulārās iejaukšanās. Tas pierāda labu veiktspēju ar īsu laiku līdz hemostāzei un labu atgriezenisko saiti operatoram, kas FemoSeal™ VCS padara par vērtīgu ierīci augšstilba piekļuves vietas slēgšanai.

### 1.4.3 Pēcpārdošanas klīniskās novērošanas datu kopsavilkums

#### 1.4.3.1 Pabeigta pēcpārdošanas klīniskā novērošana

Tālāk **1.7. tabulā** ir sniegts kopsavilkums par pabeigtajiem pēcpārdošanas klīniskās novērošanas pasākumiem.

**1.7. tabula. Pēcpārdošanas klīniskās novērošanas pasākumi**

Terumo Medical Corporation pašreizējā ziņošanas periodā (no 2019. gada 1. septembra līdz 2024. gada 31. augustam) veica trīs ārstu lietotāju augstas kvalitātes aptaujas.

FemoSeal™ klīniskajos pētījumos tika apkopoti proaktīvi klīniskie dati par FemoSeal™ VCS drošumu un veikspēju klīniskās lietošanas laikā. Aptaujā tika iekļauti jautājumi par kopējo ierīci un ar to saistītajiem piederumiem, tostarp 0,038 collu vadītājstīgu un to tiešo mijiedarbību. Vadītājstīgas klīniskie pētījumi apkopoja proaktīvus klīniskos datus par drošumu un veikspēju, klīniski lietojot 0,038 collu vadītājstīgu, kas piegādāta ar FemoSeal™ VCS. Aptaujas jautājumi īpaši koncentrējās uz vadītājstīgas vispārēju izmantošanu, sākot ar ievadīšanu caur procedūras apvalku asinsvados un beidzot ar stieples izņemšanu.

FemoSeal™ VCS un 0,038 collu vadītājstīga, kas iekļauta ierīces komplektācijā, saņēma vērtējumus kā pieņemamas, un tika iesniegtas sešas (6) sūdzības par ierīci un deviņas (9) sūdzības par vadītājstīgu, pamatojoties uz augstas kvalitātes klīnisko aptauju sniegto komentāru novērtējumu. Gan par FemoSeal, gan vadītājstīgu sūdzības tika izvērtētas un izskatītas Terumo pēcpārdošanas uzraudzības procesa ietvaros. Netika konstatēti jauni riski vai riska līmeņi.

2024. gadā PMCF aktivitāšu ietvaros tika veikta ārstu lietotāju aptauja. Pētījuma rezultāti parādīja, ka FemoSeal™ VCS veikspējas novērtējums un drošums kopumā bija ļoti labvēlīgi. Ir pierādīta arī tādu citu vadītājstīgu saderība, kuras nav iekļautas standarta FemoSeal™ VCS komplektācijā.

### 1.4.3.2 Notiekošā/plānotā klīniskā pēcpārdošanas uzraudzība

TMC ir viena notiekošā/plānota pēcpārdošanas klīniskās novērošanas darbība. Tiks veikta klīniskā izpēte, lai prospektīvi apkopotu atgriezenisko saiti par vadītājstīgas izmantošanu ar ierīci FemoSeal VCS, kas izplatīta ES tirgū. Aptauju aizpildīs ārsti, lai pētījumā noskaidrotu, kuras vadītājstīgas viņi izmantoja procedūras laikā. Šīs aptaujas mērķis ir novērst nepilnību, kas identificēta kā literatūras un ārēju pārskatītāju komentāru trūkums par FemoSeal™ VCS saderību ar citu (nevis Terumo zīmolu) vadītājstīgu izmantošanu. Atgriezeniskā saite ietver tehniskos rezultātus, klīnisko veikspēju un drošumu, kas attiecas uz ierīces veikspēju ar citām vadītājstīgām.

### 1.4.4 Sistemātiskās literatūras pārskata datu kopsavilkums

Terumo Medical Corporation veic sistemātiskus literatūras apskatus, lai apkopotu un novērtētu klīniskā drošuma un veikspējas datus no publicētajiem pētījumiem par FemoSeal™ VCS un/vai līdzīgām ierīcēm. Publicētās literatūras ikgadējās pārbaudes mērķis ir identificēt iepriekš nezināmas blakusietekmes, novērot zināmas blakusietekmes, identificēt neparedzētus riskus un identificēt FemoSeal™ VCS iespējamu sistemātisku nepareizu lietošanu vai izmantošanu bez marķējuma.

Jaunākajā sistemātiskajā literatūras apskatā, kas aptver laikposmu no 2019. gada 1. septembra līdz 2024. gada 31. augustam, tika apzināti 29 publicēti pētījumi, kas sniedza klīniskā drošuma un veikspējas datus par FemoSeal™ VCS. Divdesmit trīs atsauksmes tika sniegtas par FemoSeal™ VCS lietošanu paredzētajam mērķim, bet par neparedzētu lietojumu tika ziņots deviņos pētījumos. Kopumā dokumentācijas apskatā par pētījumiem, kas attiecas uz FemoSeal™ VCS lietošanu, redzams, ka pētāmajā populācijā ir pārstāvēti tādi pacienti ES, kuriem tiek veiktas perkutānās vaskulārās katetrizācijas procedūras. Šo 23 recenzēto publikāciju par lietošanu paredzētajam mērķim sarakstu skatiet **3. sadaļā**.

Klīniskā veikspēja tika novērtēta šādā veidā:

- Laiks līdz hemostāzei ir īsāks par to laiku, kas ir nepieciešams jaunāko tehnoloģiju kopējās augšstilba artērijas perkutānai slēgšanai, vai tam līdzīgs.
- Laiks līdz spējai patstāvīgi pārvietoties ir īsāks par to laiku, kas ir nepieciešams jaunāko tehnoloģiju kopējās augšstilba artērijas perkutānai slēgšanai, vai tam līdzīgs.
- Pēcoperācijas komplikāciju biežums ir līdzīgs pašreizējiem aprūpes standartiem vai mazāks par tiem.

Pamatojoties uz šiem klīniskās veikspējas mērījumiem, šajā dokumentācijas pārskatā sniegtie dati parādīja, ka FemoSeal™ VCS var veiksmīgi izmantot augšstilba artērijas punkcijas (arteriotomijas) noslēgšanai pacientiem, kuriem veikta perkutāna katetrizācija, izmantojot 7 Fr vai mazāku procedūras apvalku. Pilnīga hemostāze tika sasniegta lielākajai daļai pacientu (79,65-100%), un vidējais laiks līdz hemostāzei bija 0,5 minūtes, vidējais laiks līdz izrakstīšanai

3 dienas. 69,2-86,7% pacientu spēja patstāvīgi staigāt pēc 5 stundām pēc slēgšanas, vidējais gultas režīma ilgums pēc operācijas bija 349 min. FemoSeal™ VCS kļūme tika novērota 3,68-4% gadījumu, un 0,9-4,4 % procedūru bija nepieciešama papildu manuāla kompresija.

Klīnisko drošumu novērtēja pēc nevēlamiem notikumiem, tostarp, bet ne tikai:

- Asiņošana
- Hematoma
- Pseudoaneirisma
- Zilums
- Arteriovenoza fistula
- Infekcija
- Nāve

Katram no šiem nevēlamajiem notikumiem ziņotais FemoSeal™ VCS sastopamības biežums iekļautajos pētījumos bija mazāks vai salīdzināms ar vēsturiski ziņoto līmeni manuālai kompresijai un citām asinsvadu slēgšanas ierīcēm.

Pārskatot 10 ziņojumus par gadījumiem, netika konstatēti nevēlami notikumi, jo netika konstatēti jauni, neparedzēti, negaidīti vai nepieņemami riski.

FemoSeal™ VCS lietošanas kopējā efektivitāte diagnostiskās angiogrāfijas vai invazīvo operāciju laikā ir atkarīga no vairākiem faktoriem, piemēram, dzimuma, vecuma, pacienta anatomijas, blakusslimībām, punkcijas vietas anatomiskā novietojuma, ķirurga pieredzes, VCD ievietošanas metodes, pēcoperācijas aprūpes u.c. Papildus tehniskajiem panākumiem, tostarp hemostāzes sasniegšanai, FemoSeal™ VCS nodrošināja klīniskos ieguvumus, kas saistīti ar asinsvadu slēgšanu pēc augšstilba artērijas punkcijas, piemēram, laika samazināšanos līdz hemostāzei, laika samazināšanos līdz patstāvīgai staigāšanai. FemoSeal™ VCS ierīču veikspējas iznākums atbilst iznākumam, kas sagaidāms šāda veida ierīcēm, ja tās tiek izmantotas paredzētajā veidā. Dažas atsauksmes, kas iegūtas pašreizējā meklēšanas periodā, parādīja, ka pētāmā ierīce tika izmantota anatomiskā vietā, kas nav kopējā augšstilba artērija, un arteriotomiju slēgšanai > 7 Fr, kas tiek uzskatīta par neparedzētu lietojumu.

Pārskatīšanas laikā netika konstatētas nezināmas blakusietekmes, negaidīti riski vai iespējama ierīces sistemātiska nepareiza lietošana. Tomēr, ja FemoSeal™ VCS piesardzīgi lieto apmācīti ārsti, medicīniskā ierīce darbojas kā noderīga un nepieciešama klīniskā ierīce. Kopumā mērķa terapija un līdz ar to FemoSeal™ VCS atbilst klīniskajām vajadzībām, kas pašlaik pastāv ar asinsvadu piekļuvi saistītu komplikāciju ārstēšanai.

Kopumā šajā dokumentācijas pārskatā sniegtajos datos netika konstatētas iepriekš nezināmas veikspējas vai drošuma problēmas klīniskajā vidē vai nelabvēlīga ietekme, kas radusies, pārsniedzot paredzamo/pieļaujamo līmeni. Tādēļ no šī dokumentācijas apskata var secināt, ka

FemoSeal™ VCS, kad to izmanto, lai nodrošinātu hemostāžu saspiešanu arteriotomijā pēc perkutānas kateterizācijas, turpina darboties, kā paredzēts, un nav saistīta ar nopietniem drošības notikumiem.

#### 1.4.5 Pēcpārdošanas uzraudzības datu kopsavilkums

Ir ieviesta proaktīva PMS sistēma, un visu sūdzību izskatīšana tiek veikta reizi mēnesī un saskaņā ar iekšējām ražošanas procedūrām. Tika analizēti sūdzību dati par laika periodu no 2019. gada 1. septembra līdz 2024. gada 31. augustam. Kopumā bija 28 medicīnisko ierīču kontroles (Medical Device Vigilance — MDV) ziņojumi un 476 klientu sūdzību ziņojumi ražotājam. No 28 MDV ziņojumiem 27 bija saistīti ar nelabvēlīgiem notikumiem un viens ar ierīces nepareizu darbību. Ziņošanas periodā bija divi nāves gadījumi, bet neviens no ziņotajiem nāves gadījumiem netika uzskatīts par saistītu ar pētāmo ierīci. Starp 476 sūdzībām, kas iesniegtas ražotājam, visbiežākie sūdzību iemesli bija izvietošanas grūtības (146 gadījumi, 0,0142% gadījumu). Otrs biežākais iemesls bija izvilksanas gadījumu kļūmju režīms — 0,0126% (130 notikumi).

FemoSeal™ Vascular Closure System ir pārdota vairāk nekā 1 030 136 eksemplāros visā pasaulē un 827 843 eksemplāros Eiropas Ekonomikas zonā. Aprēķinātais sūdzību biežums attiecībā pret globālajiem pārdošanas apjomiem ir 0,046%. Kopējais klientu sūdzību īpatsvars ir ļoti zems. Nav konstatēti jauni riski, kas nav iekļauti lietošanas pamācībā un riska dokumentācijā.

Nevēlamo blakusparādību sastopamības rādītāji ir norādīti **1.2. tabulā**. Sūdzībās netika identificēti jauni neparedzēti, pēkšņi vai nepieņemami riski. Zināmo nevēlamo blakusparādību biežums vai smagums būtiski nepalielinājās.

#### 1.4.6 Klīniskās veiktspējas un drošuma vispārīgs kopsavilkums

FemoSeal™ VCS ir indicēta lietošanai, lai slēgtu kopējās augšstilba artērijas punkciju (arteriotomiju) pacientiem, kam ir veikta perkutāna katetrizācija, izmantojot 7F (2,33 mm) vai mazāku procedūras apvalku. Šis klīniskais novērtējums ir balstīts uz pieejamo pirmspārdošanas un pēcpārdošanas klīnisko datu un tās literatūras visaptverošu analīzi, kas attiecas uz FemoSeal™ VCS paredzēto lietojumu.

Tika veikts visaptverošs pārskats par literatūru, kas publicēta laika posmā no 2019. gada 1. septembra līdz 2024. gada 31. augustam. Pierādījumu kopumā bija 29 pētījumi par FemoSeal™ VCS. Klīniskajā novērtējumā sniegtie pierādījumi ļauj secināt, ka, lietojot saskaņā ar indikācijām, pētāmā ierīce ir droša un efektīva, un jebkādi riski vai nevēlamās blakusparādības, kas var būt saistītas ar ierīci normālos lietošanas apstākļos, ir pieņemami riski, salīdzinot ar ieguvumiem pacientam. Pētāmo ierīču veiktspējas iznākums atbilst iznākumam, kas sagaidāms šāda veida ierīcēm, ja tās tiek izmantotas paredzētajā veidā.

Iespējamās nevēlamās blakusietekmes, kas saistītas ar FemoSeal™ VCS lietošanu, ietver nevēlamos notikumus, par ko parasti ziņo alternatīvu arteriotomijas slēgšanas līdzekļu

izmantošanas gadījumā, piemēram, asiņošanu un hematomu. Kopumā par FemoSeal™ VCS lietošanu ziņoto nevēlamo notikumu sastopamības rādītāji ir līdzīgi tiem, kas ziņoti par manuālās kompresijas un līdzīgu asinsvadu slēgšanas ierīču izmantošanas gadījumiem. Konkrēti runājot, asiņošanas un hematomas gadījumā ziņotie FemoSeal™ VCS rādītāji ir mazāki par ziņotajiem rādītājiem līdzīgām asinsvadu slēgšanas ierīcēm. Katrs no ziņotajiem nevēlamajiem notikumiem, gan no publicētās dokumentācijas, gan pēcpārdošanas uzraudzības, bija iepriekš konstatēti (sk. **sadaļu 1.3**).

Esošie FemoSeal VCS dati par klīnisko drošumu un veiktspēju liecina, ka šīs asinsvadu slēgšanas ierīces lietošana, ja tā notiek saskaņā ar lietošanas pamācību, pacientam sniedz ieguvumus, kas pārsniedz iespējamos riskus.

Kā norādīts iepriekšējās sadaļās, dati, kas sniegti par FemoSeal™ VCS, liecina par konsekvenci starp datiem, kas saistīti ar novērtējamo ierīci (piemēram, ierīces lietošana, drošības rezultāti, klīniskā veiktspēja un klīniskie ieguvumi), identificētajām ekvivalentajām ierīcēm un datiem, kas saistīti ar līdzīgām ierīcēm, kuras uzskaitītas pie jaunākajām tehnoloģijām.

Drošuma datu šķērsanalīzē netika konstatētas nepilnības starp tālāk norādīto:

- Datiem, kas minēti pie jaunākajām tehnoloģijām
- Novērtējamai ierīcei specifiskajiem datiem
- Datiem, kas minēti riska pārvaldības failā(-os)
- Marķējumā un/vai lietošanas instrukcijā minētos datos (t.i., atlikušie lietotājam nodotie riski tiek risināti).

Klīnisko drošumu pierāda zemie komplikāciju rādītāji, kas konstatēti publicētajā recenzētajā klīniskajā literatūrā, uzņēmuma sponsorētajos klīniskajos pētījumos, pēcpārdošanas datu pārskatos, kas saistīti ar neizņemšanu no pārdošanas. Nav konstatētas bažas par veiktspēju, pārskatīšanā izmantotajā literatūrā ir ietverts FemoSeal™ VCS lietojums, kas atbilst ražotāja paredzētajam lietojumam.

### **1.5. Iespējamās diagnostikas vai terapijas alternatīvas**

Manuālo kompresiju tradicionāli izmanto, lai panāktu hemostāzi arteriotomijas vietā pēc asinsvadu katetrizācijām. Manuāla kompresija ir saistīta ar pacienta imobilizāciju ilgu laiku (līdz 8 stundām pēc procedūras) un ar ievērojamu diskomfortu un ilgstošu uzturēšanos slimnīcā. Nesēnā sistemātiskā pārskatā tika konstatēts, ka vidējais laiks, lai panāktu hemostāzi ar manuālu kompresiju, bija 20,8 minūtes.<sup>1</sup>

Manuālas kompresijas alternatīvas ietver ārējas hemostatiskas ierīces, kas arteriotomijas vietā veic mehānisku kompresiju. Šīs ierīces nesaīsina laiku līdz hemostāzei vai laiku, lai brīdīm, kad pacients var patstāvīgi pārvietoties, bet samazina pieprasījumu pēc personāla, aizstājot manuālo

kompresiju ar mehānisku kompresiju. Ar mehāniskās kompresijas izmantošanu saistīto nevēlamo notikumu biežums ir līdzīgs notikumu biežumam ar manuālu kompresiju.

Asinsvadu slēgšanas ierīces, piemēram, FemoSeal™ VCS, ir paredzētas arteriotomijas noslēgšanai. To mērķis ir samazināt laiku līdz hemostāzei un nodrošināt agrāku spēju patstāvīgi pārvietoties. Nesenā sistemātiskā pārskatā, kurā bija ietvertas 13 komerciāli pieejamas ierīces, tika konstatēts, ka vidējais laiks līdz hemostāzei ar asinsvadu slēgšanas ierīci bija 5,4 minūtes. Vidējais hemostāzes laiks atsevišķām asinsvadu slēgšanas ierīcēm svārstījās no 1 minūtes (FemoSeal™ VCS) līdz 14 minūtēm; lielākajai daļai ierīču tas bija no 4 līdz 10 minūtēm.<sup>1</sup>

Bieži ziņotie nevēlamie notikumi, kas saistīti ar arteriotomijas vietas slēgšanu, ar manuālu kompresiju, ārējām hemostatiskām ierīcēm vai asinsvadu slēgšanas ierīcēm, ietver hematomu, asiņošanu piekļuves vietā, pseidoaneirismu, arteriovenoza fistulu un infekciju. Tajā pašā sistemātiskajā pārskatā (34 nejauši kontrolēti pētījumi, 14 401 pacients) tika konstatēts, ka nevēlamo notikumu biežums manuālās kompresijas un asinsvadu slēgšanas ierīču lietošanas gadījumos ir līdzīgs, izņemot to, ka asiņošanas rādītājs ar asinsvadu slēgšanas ierīcēm mēdz būt nedaudz augstāks.<sup>1</sup>

## 1.6 Ieteiktais lietotāja profils un apmācība

FemoSeal™ Vascular Closure System paredzētie lietotāji ir ārsti, kuri ir apmācīti, lai viņi varētu veikt arteriālo piekļuvi un slēgšanu endovaskulārajās procedūrās, izmantojot kopējo augšstilba artēriju, un ir piedalījušies Terumo Medical Corporation FemoSeal™ ārstu instruēšanas programmā.

## 1.7 Attiecīgie saskaņotie un kopējie standarti

Ši saugos ir klinikinio veiksmingumo duomenų santrauka (SKVDS) skirta visuomenei susipažinti su atnaujinta kraujagyslių uždarymo sistemos FemoSeal™ Vascular Closure System (VCS) pagrindinių saugos ir klinikinio veiksmingumo aspektų santrauka.

Toliau pateikiama naudotojams/sveikatos priežiūros specialistams skirta priemonės saugos ir klinikinio veiksmingumo santrauka **1.0 skyriuje**.

## **1.0 NAUDOTOJAMS/SVEIKATOS PRIEŽIŪROS SPECIALISTAMS SKIRTA SANTRAUKA**

SKVDS neskirta pakeisti naudojimo instrukciją, kuri yra pagrindinis dokumentas, užtikrinantis saugų prietaiso naudojimą, taip pat neskirta teikti diagnostinių ar terapinių pasiūlymų numatytiems naudotojams ar pacientams. SKVDS nėra skirta pakeisti privalomos implantų kortelių ar kituose privalomuose dokumentuose pateikiamos informacijos.

### **1.1 Numatytoji prietaiso paskirtis**

#### **1.1.1 Paskirtis**

Kraujagyslių uždarymo sistema FemoSeal™ Vascular Closure System yra medicinos priemonė, skirta arterinei punkcijai uždaryti po perkutaninio kateterizavimo per bendrąją šlaunies arteriją.

#### **1.1.2 Naudojimo indikacijos**

Kraujagyslių uždarymo sistema FemoSeal™ Vascular Closure System skirta naudoti uždarant bendrąją šlaunies arterinę punkciją (arteriotomiją) pacientams, kuriems buvo atliktas perkutaninis kateterizavimas naudojant 7F (2,33 mm) arba mažesnę procedūrinę movą.

#### **1.1.3 Kontraindikacijos ir (arba) apribojimai**

Kraujagyslių uždarymo sistemos FemoSeal™ Vascular Closure System negalima naudoti pacientams, kuriems atlikta arteriotomija, kurios metu naudojamos didesnės nei 7F (2,33 mm) movos ar įtaisai.

#### **1.1.4 Tikslinės pacientų populiacijos**

Kraujagyslių uždarymo sistemos FemoSeal™ Vascular Closure System saugumas ir veiksmingumas nustatytas 18 metų ir vyresniems pacientams, kuriems buvo atliktas perkutaninis kateterizavimas naudojant 7F (2,33 mm) arba mažesnę procedūrinę movą.

#### **1.1.5 Specialios pacientų populiacijos**

Kraujagyslių uždarymo sistemos FemoSeal™ Vascular Closure System saugumas ir veiksmingumas nebuvo nustatytas šioms pacientų populiacijoms:

- Pacientams, sergantiems autoimunine liga.
- Pacientams, kuriems atliekama terapinė trombolizė.
- Pacientams, sergantiems kliniškai reikšminga periferinių kraujagyslių liga.
- Pacientams su nekontroliuojama hipertenzija (>220 mmHg sistolinis arba >110 mmHg diastolinis).

- Pacientams, kuriems nustatytas kraujavimo sutrikimas, įskaitant trombocitopeniją (<100 000 trombocitų skaičius) arba anemiją (Hgb <10 mg/dl).
- Pacientams, kurių bendrosios šlaunies arterijos vidinis spindis mažesnis nei 5 mm.
- Pacientams, kurių sutrikusi inkstų ir (arba) kepenų funkcija.
- Pacientams, sergantiems kitomis atitinkamomis gretutinėmis ligomis.
- Populiacijai, turinčiai tam tikrą rasinę ir (arba) etninę kilmę.
- Pacientams, kuriems per 72 valandas pasireiškė miokardo infarktas.
- Pacientams, punkcijos vietoje turintiems kraujagyslių transplantatą arba stentą.
- Nėščioms arba žindančioms pacientėms.
- Jaunesniems nei 18 metų pacientams.

### 1.1.6 Numatytasis naudojimas

Kraujagyslių uždarymo sistemos FemoSeal™ Vascular Closure System numatytieji naudotojai yra gydytojai, turintys kvalifikaciją atlikti arterinę prieigą ir uždarymą atliekant endovaskulines procedūras per bendrąją šlaunies arteriją ir dalyvavę Terumo Medical Corporation FemoSeal™ gydytojų mokymo programoje.

## 1.2 Įtaiso aprašas

### 1.2.1 Įtaiso aprašas

Terumo Medical Corporation (TMC) pagaminta kraujagyslių uždarymo sistema FemoSeal™ Vascular Closure System – tai rezorbuojamasis kraujagyslių uždarymo įtaisas, skirtas pasiekti šlaunies arterijų hemostazę po perkutaninio kateterizavimo per bendrąją šlaunies arteriją.

FemoSeal™ uždarymo elementus sudaro du rezorbuojami polimeriniai diskai, vidinis sandariklis ir išorinis fiksavimo diskas, sutvirtinti rezorbuojamu daugiagysliu siūlu ir mechaniškai užsandarinantys arteriotomiją (žr. **1.1 pav.** ir **1.2 pav.**). Įvestas per kūginę korpuso movą, išorinis fiksavimo diskas prispaudžiamas prie daugiagyslio veleno, todėl mechaniškai užverinama punkcijos vieta tarp vidinio ir išorinio fiksavimo disko. Vidinis sandariklis ir išorinis fiksavimo diskas prilaikomi dėl daugiagyslio veleno trinties. Hemostazė pasiekama mechaninėmis priemonėmis. Uždarymo elementai suyra hidrolizės būdu.

Implantuojami uždarymo komponentai, vidinis sandariklis ir išorinis fiksavimo diskas suyra per aštuoniolika (18) mėnesių, o daugiagyslis siūlas suyra ir hidrolizės būdu yra absorbuojamas aplinkinių audinių po dviejų (2) ar trejų (3) metų. Implantuojamų uždarymo komponentų gebėjimas išlaikyti arteriotomijos suspaudimą buvo išbandytas iki aštuonių (8) valandų. Yrantys

produktai metabolizuojami ir išsiskiria su šlapimu arba kaip anglies dioksidas pasišalina per plaučius. Tyrimų su gyvūnais metu kaupimosi poveikis nepastebėtas. Papildomi FemoSeal™ komponentai, kurie procedūros metu liečiasi su gyvais audiniais ar krauju, yra kūginė korpuso mova, plėtiklis, plėtimo vamzdelis, stūmiklis ir kreipiamoji viela.

### 1.1 pav. Atitinkamai vidinis sandariklis ir išorinis fiksavimo diskas

### 1.2 pav. Įvestas vidinis sandariklis ir išorinis fiksavimo diskas

FemoSeal™ įtaisas yra supakuotas kartu su plėtikliu ir 0,038 col. (0,97 mm) išorinio skersmens, 27,5 col. (70 cm) ilgio kreipiamąja viela ir J formos įtempikliu, žr. toliau pateiktą **1.3 pav.** Kreipiamoji viela yra polietileniniame vamzdelyje. Visos dalys supakuotos į fiksuotą popieriaus dėklą. Pakuotėje taip pat yra paciento implanto kortelė. Kad įtaisas veiktų kaip numatyta, kraujagyslių uždarymo sistemai FemoSeal™ Vascular Closure System nereikia papildomų priedų, o pats įtaisas yra skirtas naudoti tik su pakuotėje esančiu plėtikliu ir kreipiamąja viela.

Pav. 1.3 FemoSeal™ VCS įtaisas su kreipiamąja viela ir plėtikliu

1.2.2 Žaliavos ir komponentai

Toliau pateiktoje 1.1 lentelėje išvardyti FemoSeal™ VCS komponentai.

1.1 lentelė FemoSeal™ VCS medžiagos ir komponentai

| Dalies numeris | Aprašymas                                                     |                                                                   | Medžiagos                                                                                                                                                                                                        |
|----------------|---------------------------------------------------------------|-------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1              | 0,038 col. (0,97 mm) kreipiamoji viela su J formos įtempikliu |                                                                   | <p>Kreipiamoji viela: 304 Nerūdijantis plienas</p> <p>J formos įtempiklis: Polipropilenas, purpurinis pigmentas</p> <p>Spaustukas: polietilenas</p> <p>Vamzdelis: polietilenas</p>                               |
| 2              | FemoSeal™ plėtiklis                                           |                                                                   | <p>Įvorė: tetrahidrofuranas, mėlynas pigmentas, polibutileno tereftalatas (PBT)</p> <p>Vamzdelis: didelio tankio polietilenas (DTPE), juodas pigmentas</p> <p>Tepamoji priemonė: Silikonas „Dow Corning 360“</p> |
| 3/4            | FemoSeal™ įtaisas                                             | Formuotas RD7 – vidinis sandariklis ir išorinis fiksavimo diskas* | Kopolimeras tarp glikolido, trimetileno karbonato, ε-kaprolaktono ir TMP: trimetilpropanas (iniciatorius)                                                                                                        |
|                |                                                               | Daugiagyslis siūlas*                                              | Segmentuotas kopolimeras tarp L, L-laktido, trimetileno karbonato, ε-kaprolaktono ir 1,3 propanediolio (iniciatoriaus)                                                                                           |

|  |  |                     |                                                                  |
|--|--|---------------------|------------------------------------------------------------------|
|  |  |                     | Danga yra kopolimeras tarp glikolidų, ε-kaprolaktono ir L-lizino |
|  |  | Plėtimo vamzdelis   | Polipropilenas                                                   |
|  |  | Stūmiklis           | 304V nerūdijantis plienas                                        |
|  |  | Slankiklis          | Polibutileno tereftalatas (PBT)                                  |
|  |  | Korpusas            | Polibutileno tereftalatas (PBT)                                  |
|  |  | Mygtukas            | Polibutileno tereftalatas (PBT)                                  |
|  |  | Mygtuko dangtelis   | Polioksimetilenas (POM) / poliacetalo kopolimeras                |
|  |  | Mova                | Polibutileno tereftalatas (PBT)                                  |
|  |  | Tarpiklis           | Polibutileno tereftalatas (PBT)                                  |
|  |  | Kūgis               | Polipropilenas                                                   |
|  |  | Korpuso dangtis     | Polibutileno tereftalatas (PBT)                                  |
|  |  | Apsauginis įtaisas  | Polibutileno tereftalatas (PBT), mėlynas pigmentas               |
|  |  | Movos dangtelis     | Polibutileno tereftalatas (PBT)                                  |
|  |  | Vamzdelio tarpiklis | Silikoninė atrama A 70                                           |
|  |  | Korpuso tarpiklis   | Silikoninė atrama A 50                                           |
|  |  | Spyruoklė           | 302 nerūdijantis plienas                                         |
|  |  | Kūginė korpuso mova | Polipropilenas<br>Silikoninis „Dow Corning“ 360, heksanas        |

\*Implantuojama įtaiso dalis; implantuojami komponentai yra saugūs MRT aplinkoje

FemoSeal™ VCS yra sterilizuota etileno oksidu (EO) ir yra vienkartinio naudojimo medicinos priemonė. FemoSeal™ VCS įtaisas suprojektuotas taip, kad jo nebūtų galima naudoti pakartotinai.

### **Veikimo būdas**

FemoSeal™ VCS skatina mechaninę hemostazę, įterpiant implantuojamus uždarymo elementus į bendrąją šlaunies arteriją ir už jos ribų. Nuo kraujavimo apsaugantį mechanizmą užtikrina punkcijos vietą užsandarinantis vidinis sandariklis ir vidinį sandariklį prilaikantis išorinis fiksavimo diskas.

### 1.2.3 Klinikinė nauda

FemoSeal™ VCS teikia šią klinikinę naudą, susijusią su kraujagyslių uždarymu po bendrosios šlaunies arterijos punkcijos:

- Laiko iki hemostazės sutrumpinimas<sup>1</sup>
- Laiko iki ambuliacijos sutrumpinimas<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015).

*Sisteminis atsitiktinių imčių kontroliuojamų tyrimų, kuriuose lyginamas rankinis suspaudimas su kraujagyslių uždarymo prietaisais diagnostinėms ir terapinėms arterijų procedūroms, apžvalga. Tarptautinė chirurgijos technologija, 27, 32–44.*

### 1.2.4 Ankstesnė(-s) karta(-os) arba versijos

- Pirmoji FemoSeal™ VCS (Nr. 11200) versija Europos rinkoje buvo pardavinėjama 2005 ir 2006 metais.
- Dabartinė FemoSeal™ VCS (Nr. 11202) su patobulinta įvedimo sistema rinkoje pasiekama nuo 2006 m. kovo 28 d.

### 1.2.5 Kartu su įtaisu skirti naudoti priedai

FemoSeal™ įtaisas yra supakuotas kartu su plėtikliu, 0,038 col. (0,97 mm) išorinio skersmens, 27,5 col. (70 cm) ilgio kreipiamąja viela ir J formos įtempikliu. Kreipiamoji viela yra FemoSeal™ įtaiso priedas. J formos įtempiklis yra kreipiamosios vielos komponentas, o plėtiklis yra FemoSeal™ įtaiso komponentas. Kreipiamoji viela yra vienintelis reikalingas priedas. Kreipiamoji viela yra polietileniniame vamzdyje. Visos dalys supakuotos į fiksuotą popieriaus dėklą. Pakuotėje taip pat yra paciento implanto kortelė. Kad įtaisas veiktų kaip numatyta, kraujagyslių uždarymo sistemai FemoSeal™ Vascular Closure System nereikia papildomų priedų, o pats įtaisas yra skirtas naudoti tik su pakuotėje esančiu plėtikliu ir kreipiamąja viela.

### 1.2.6 Kartu su prietaisu skirti naudoti kiti įtaisai ir gaminiai

Kad veiktų kaip numatyta, FemoSeal™ VCS nereikia papildomų prietaisų.

## 1.3 Rizika ir Ispėjimai

### 1.3.1 Liekamoji rizika ir nepageidaujamas poveikis

Žinomi arba numatomi nepageidaujami reiškiniai, žala ir komplikacijos, susiję su FemoSeal™ VCS naudojimu dėl liekamosios rizikos, išvardyti **1.2 lentelėje**. Įvykių dažnis grindžiamas rizikos dokumentų analize ir apskaičiuojamas remiantis priežiūros po pateikimo į rinką duomenimis nuo 2019 m. rugsėjo 1 d. iki 2024 m. rugpjūčio 31 d. Nėra jokios nežinomos FemoSeal™ VCS liekamosios rizikos, o visos taikomos rizikos buvo pašalintos pateikus atitinkamas naudojimo instrukcijas.

**Lentelė 1.2. FemoSeal nepageidaujami reiškiniai/Komplikacijos**

| Žala                                              | Įvykio dažnis (%) | Lengvinantys veiksniai                                                                                                                                   |
|---------------------------------------------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alerginė reakcija                                 | 0,0000            | Rizikos mažinimo iki minimumo planai buvo sprendžiami atsižvelgiant į produkto dizaino ypatybes, gamybos gaires, produkto ženklinimą ir gydytojų mokymą. |
| Aneurizma                                         | 0,0000            |                                                                                                                                                          |

### 1.3.2 Įspėjimai ir atsargumo priemonės

#### Įspėjimai

1. Nenaudokite, jei pažeista pakuotė arba sterilus barjeras.
2. Nenaudokite pasibaigus tinkamumo laikui – biologiškai skaidūs komponentai gali tinkamai neveikti.
3. Nenaudokite, jei kurie nors elementai atrodo kaip nors pažeisti ar sugedę.
4. Naudojant kraujagyslių uždarymo sistemą FemoSeal™ Vascular Closure System, kai procedūrinė mova arba aplinkiniai audiniai gali būti užteršti bakterijomis, gali kilti infekcija.
5. Jei įtariama, kad galinė arterinė sienelė pradurta arba atlikta daugiau nei viena arterinė punkcija, norėdami pasiekti arterinę hemostazę nepasikliaukite vien kraujagyslių uždarymo sistema FemoSeal™ Vascular Closure System. Taikykite papildomą rankinį arba mechaninį suspaudimą.
6. Jei punkcijos vieta yra šlaunies arterijos išsišakojimo vietoje arba distalinėje jos dalyje, FemoSeal™ Vascular Closure System kraujagyslių uždarymo sistemos negalima naudoti, nes vidinis sandariklis gali būti įvedamas netinkamai. Šis įvykis gali sukelti kraujavimo komplikacijas ir (arba) sutrikdyti normalų kraujo tekėjimą.
7. Jei pjūvio vietoje yra nuolatinis arterinis kraujavimas, nenukirpkite daugiagyslio siūlo, kol nebus pasiekta hemostazė. Jei hemostazė nepasiekama, uždenkite daugiagyslį siūlą steriliu žaizdos tvarsčiu ir papildomai prispauskite, kol bus pasiekta hemostazė. Nuolatinio arterinio kraujavimo atveju galimos reikšmingos kraujavimo komplikacijos, dėl kurių pacientas gali būti sužalotas arba mirti.
8. Nenaudokite FemoSeal™ Vascular Closure System kraujagyslių uždarymo sistemos, jei punkcijos vieta yra proksimali kirkšnies raiščiui, nes tai gali sukelti retroperitoninę hematomą.
9. Pacientai, kuriems yra didesnė kraujavimo rizika, gali patirti didesnę kraujo netekimą, todėl gali prireikti kraujo perpylimo.
10. Atsikabinus vidiniam diskui, tai gali sukelti trombozinį ir (arba) embolinį įvykį.

#### Atsargumo priemonės

1. FemoSeal™ Vascular Closure System kraujagyslių uždarymo sistemos įvedimo procedūrą turi atlikti gydytojai, tinkamai apmokyti naudotis įtaisu.
2. Prieš įstatydami FemoSeal™ Vascular Closure System kraujagyslių uždarymo sistemą, atlikite ribotą šlaunies arterijos angiogramą arba ultragarsu valdomą šlaunies arterijos punkciją.

3. Nutraukite procedūrą, jei:
  - Bendrosios šlaunies arterijos spindžio skersmuo yra <5 mm.
  - Šalia bendrosios šlaunies arterijos punkcijos vietos yra stenoze ir (arba) reikšminga plokštelė.
  - Arterinė punkcija yra ties šlaunies arterijos išsišakojimu arba distalinėje dalyje.
  - Šalia bendrosios šlaunies arterijos punkcijos vietos yra anomalių šakų arba kraujagyslių anomalijų.
4. Jei yra hematoma, reikia būti ypač atsargiems, kad kūginė korpuso mova būtų tinkamai įstatyta į arteriją.
5. Naudokite vienos sienelės punkcijos techniką. Nepradurkite galinės arterijos sienelės.
6. Naudodami kraujagyslių uždarymo sistemą FemoSeal™ Vascular Closure System, visada laikykitės sterilumo reikalavimų.
7. FemoSeal™ Vascular Closure System kraujagyslių uždarymo sistema skirta naudoti tik vieną kartą, jos negalima sterilizuoti ar naudoti pakartotinai. FemoSeal™ įtaisas yra suprojektuotas taip, kad jo nebūtų galima naudoti pakartotinai.
8. Jei įvedant vidinį sandariklį netikėtai pajuntamas pasipriešinimas, procedūrą nutraukite.
9. Norėdami tinkamai įdėti vidinį sandariklį, uždėkite nykštį taip, kad mygtukas galėtų laisvai atšokti atgal.
10. Prieš įdėdami išorinį fiksavimo diską įsitikinkite, kad FemoSeal™ įtaiso kūginio korpuso movos galas yra po oda. Išorinis fiksavimo diskas gali būti netyčia įstatytas virš odos lygio pacientams, pas kuriuos atstumas tarp šlaunies arterijos ir odos lygio yra nedidelis.
11. Norint tinkamai įstatyti, prieš įvedant gali prireikti įpjauti odą.
12. Jei vidinis sandariklis yra arterijos viduje, tačiau neįmanoma iki galo nuspausti mygtuko ir įstatyti išorinio fiksavimo disko, FemoSeal™ uždarymo elementams pašalinti gali prireikti operacijos.
13. Jei per 18 mėnesių reikia atlikti tos pačios šlaunies arterijos punkciją, atlikite ją bent vienu centimetru proksimaliau ankstesnės FemoSeal™ Vascular Closure System kraujagyslių uždarymo sistemos prieigos vietos.
14. Informuokite pacientą apie poreikį laikytis gydytojo nurodymų dėl uždarymo vietos patikros.
15. Informuokite pacientą, kad kitus 18 mėnesių jis turės nešioti paciento informacinę kortelę

### Atsargumo priemonės išrašant

Prieš apsvarstydami išrašymą, įvertinkite šias paciento klinikoines būkles:

1. Kraujavimą ir (arba) hematomą uždarymo vietoje;
2. Skausmą vaikstant.
3. Uždarymo vietos infekcijos požymius.

### 1.3.3 Vietos saugos taisomieji veiksmai

Nuo 2019 m. rugsėjo 1 d. iki 2024 m. rugpjūčio 31 d. buvo atliktas vienas FemoSeal™ VCS saugos taisomasis veiksmas.

2022 m. Terumo savanoriškai atšaukė FemoSeal™ VCS dėl skundų, kur teigiama, kad Elkton gaminamo FemoSeal gaminio gamybos ir partijos išleidimo bandymai, skirti tamponavimo jėgos matavimui ir atitraukimo jėgai, buvo nesėkmingi. Iš viso Pietų Korėjoje buvo atšaukta 950 vienetų.

### 1.4 Klinikinio įvertinimo ir klinikinio stebėjimo po pateikimo rinkai santrauka

1.3 lentelėje pateikiamas pagrindinių tyrimų, skirtų FemoSeal™ VCS teikti rinkai, sąrašas, taip pat klinikiniai tyrimai po pateikimo į rinką ir klinikinio stebėjimo veikla po pateikimo į rinką. Tyrime naudojama įtaiso versija pateikta toliau esančioje lentelėje. Pirmoji FemoSeal™ VCS (Nr. 11200) versija buvo rinkoje iki 2006 m., kita versija (Nr. C11202) pateikta rinkai 2006 m. ir iki šiol joje yra.

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002<br/>Radi Medical System AB<br/><br/>Atlieka Biomatech, Prancūzija</p> | <p>Tyrimas su gyvūnais</p> | <p>Tyrimo tikslas yra įvertinti biologiškai skaidaus implanto, skirto hemostazei kraujagyslių sistemoje pasiekti, biologinį suderinamumą ir biologinį funkcionalumą. Išbandytas įtaisas buvo skirtas įvesti į punkcijos vietą arterijoje, kad būtų pasiekta hemostazė. Vienas diskas įvedamas į punkcijos angą arterijoje, o kitas pritvirtina vidinį diską iš išorinės arterijos pusės. Abu diskai buvo įvesti per įleidiklio movą. Diskai yra sukurti taip, kad neleistų kraujuoti, sugytų kraujagyslės sienelėje ir galiausiai suirtų bei būtų absorbuoti. Tyrimas skirtas rinkti ir analizuoti duomenis po funkcinio implantavimo avims ir kiaulėms, siekiant įvertinti implanto gebėjimą palaikyti fiziologinę funkciją, kai jis naudojamas kraujotakos sistemoje, nustatyti priimančiojo atsaką ir įtaiso atsaką (fizinį vientisumą, histologinę inkapsuliaciją bandomajame gyvūne) ir įvertinti implanto irimą</p> | <p>Implantavimo laikotarpis / stebėjimas visiems gyvūnams 5 savaitės</p> <p>4 avys, 1 kiaulė</p> <p>14 uždarymo elementų</p> <p>8 uždarymo elementai, implantuoti į 2 avis,</p> <p>2 uždarymo elementai, implantuoti 1 kiaulei</p> <p>Kai du uždarymo elementai buvo implantuoti į tą pačią šlaunies arteriją, jie buvo implantuoti &gt;30 mm atstumu</p> | <p>Buvo registruojami bet kokie nepalankių požymių kriterijai (uždegimas, nekrozė, kraujavimas ar bet koks kitas pažeidimas) ar bet koks plonas pseudo-randinio sluoksnio susidarymas. Ypatingas dėmesys buvo skiriamas pradinei įtaiso histologinei integracijai, ypatingą dėmesį skiriant vidinei disko inkapsuliacijai.</p> <p>Makroskopiškai reikšmingų vietinio netoleravimo ar trombų susidarymo požymių nepastebėta. Makroskopinis stebėjimas neatskleidė jokio skirtumo tarp avių ar kiaulių po to, kai šlaunies arterijose buvo implantuoti uždarymo elementai. Makroskopiškai reikšmingų vietinio netoleravimo ar trombų susidarymo požymių nepastebėta. Makroskopinis stebėjimas neatskleidė jokio skirtumo tarp avių ar kiaulių po to, kai šlaunies arterijose buvo implantuoti uždarymo elementai.</p> <p>Avių implantavimo vietos histopatologinė analizė neparodė vietinių nepageidaujamų reakcijų. Vidiniuose ir išoriniuose diskuose buvo degradacijos požymių ir, kai kuriais atvejais, jie buvo suskaidyti į mažesnes dalis. Vidiniai diskai buvo visiškai</p> |

|                                                                                                                                                                                                              |                                  |                                              |                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                    | <p>integruoti į randinį audinį. Kiaulių histopatologinė analizė parodė šiek tiek daugiau uždegiminių požymių aplink vidinius ir išorinius diskus. Abiejuose gyvūnuose daugiagyslis siūlas sukėlė šiek tiek daugiau uždegimo požymių nei disko medžiaga, kas dėl didesnio paviršiaus ploto yra normalu pintiems siūlams.</p> <p>Kraujagyslės pralaidumas buvo matuojamas po 5 savaičių, naudojant tris skirtingus metodus: histomorfometrinių, histomorfometrinių ir kraujagyslių skersmens matavimą slankmačiu ir naudojant spalvinę doplerio ultragarsografiją. Vidutinis avių kraujagyslės pralaidumas buvo 60–80 %, priklausomai nuo metodo (12 stebėjimų). Kiaulių vidutinis kraujagyslės pralaidumas buvo 40–80 % (2 stebėjimai).</p> |

Įgyvendinant FemoSeal™ VCS vystymo iki pateikiant rinkai planą, buvo atlikti trys funkciniai bandymai su gyvūnais. Prieš pradėdant klinikinius tyrimus, FemoSeal™ VCS biologiniam funkcionalumui įvertinti 2000 m. buvo atliktas tyrimas su gyvūnais. Šiame tyrime įvertintas uždarymo elementų gebėjimas palaikyti fiziologinę funkciją ir įvertinti jų degradaciją. Po 18 mėnesių vidinė ir išorinė disko medžiaga nebebuvo matoma, pakeista endoliuminaliniu pluoštiniu audiniu. Apibendrinant buvo patvirtinta FemoSeal™ VCS uždarymo elemento geba fiziologinei funkcijai palaikyti, kai jis naudojamas kraujotakos sistemoje.

Siekiant įvertinti biologiškai skaidomo FemoSeal™ VCS implanto, skirto hemostazei kraujagyslių sistemoje pasiekti, biologinį suderinamumą ir biologinį funkcionalumą, 2002 m. buvo atliktas tyrimas su gyvūnais. Apibendrinant galima pasakyti, kad implantas beveik visiškai suiro per 36 savaites ir nebuvo reikšmingos nepageidaujamos audinių reakcijos.

Kito 2002 m. atlikto tyrimo su gyvūnais metu buvo įvertintas biologiškai skaidomo FemoSeal™ VCS implanto, skirto hemostazei kraujagyslių sistemoje pasiekti, biologinis suderinamumas ir biologinis funkcionalumas. Po 5 savaitžių disko inkapsuliacija buvo baigta ir buvo pastebėti vidinio ir išorinio diskų degradacijos požymiai. Apibendrinant, buvo patvirtintas implanto gebėjimas palaikyti fiziologinę funkciją, kai jis naudojamas kraujotakos sistemoje.

Pagal FemoSeal™ VCS klinikinės plėtros planą, prieš pateikiant rinkai, Radi Medical System AB atliko klinikinį tyrimą. Šis klinikinis tyrimas nėra skelbiamas arba pasiekiamas internete. Tyrimas su Nr. 11200 modelio įtaisu buvo atliktas 2002–2004 m. pagal Europos standartą EN 540 (medicininių prietaisų klinikinis tyrimas žmonėms) ir pagal ICH bendruosius klinikinių tyrimų reikalavimus ir geros klinikinės praktikos gaires. Išsami informacija apie šį tyrimą pateikta ataskaitoje EU-SE-001. Klinikinis tyrimas buvo aprašytas galutinėje Radi Medical Systems AB ataskaitoje „Multi-Centre Clinical Trial of the FemoSeal™ Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures“. Klinikinis tyrimas buvo atliktas naudojant pirmąjį FemoSeal modelį Nr. 11200 ir buvo sutelktas į implantuojamų uždarymo komponentų saugumą ir efektyvumą. Vienintelis skirtumas tarp pirmojo modelio Nr. 11200 ir dabartinio modelio C11202 yra prancūziški dydžiai, atitinkamai 6F ir 7F, ir patobulinta tiekimo sistema. Klinikinė nauda, numatytasis naudojimas, veikimo principai ir implantuojamų uždarymo elementų žaliavos, vidinis sandariklis ir išorinis fiksavimo diskas lieka nepakitę.

Įtaisas buvo skirtas pacientams, kuriems buvo atliekamos diagnostinės širdies ar intervencinės širdies procedūros, kaip prieigos tašką naudojant šlaunies arteriją. Šio tyrimo tikslas buvo nustatyti FemoSeal™ VCS saugumą, veiksmingumą ir efektyvumą. Tai buvo perspektyvinis, daugiacentris, vienos grupės atvirasis tyrimas su 30 dienų stebėjimu.

Pirminis veiksmingumo vertinamasis taškas buvo laikas iki hemostazės, apibrėžiamas kaip stipraus kraujavimo nebuvimas. Pirminė saugumo vertinamoji baigtis buvo sunkių kraujagyslių komplikacijų dažnis per 30 dienų. Antrinės vertinamosios baigtys apėmė laiką iki ambuliacijos,

gydymo sutrikimų dalį, nepageidaujamų reiškinių dažnį ir įtaiso veikimo charakteristikas įvedimo ir įdėjimo metu.

Į šį tyrimą įtraukti pacientai buvo suaugusieji, galintys pateikti informuoto asmens sutikimą ir turintys bent vieną nepažeistą apatinių galūnių pulsą. Pacientai nebuvo įtraukti į tyrimą, jei jie turėjo bet kurią iš šių būklių:

- Periferinių kraujagyslių ligų istoriją
- Autoimuninę ligą
- Žinomą sunkios anemijos kraujavimo sutrikimą
- INR >1,5
- Miokardo infarktą su 72 val.
- Nekontroliuojamą hipertenziją nepaisant gydymo
- Nutukimą, dėl kurio negalima prieiga taikant Seldingerio techniką
- Arteriotomijos vietoje yra kraujagyslių transplantatas arba stentas
- Ankstesnė ipsilateralinė punkcija 3 mėn. laikotarpyje
- Numatoma gyvavimo trukmė <6 mėn.

Be to, pacientai buvo tiriami operacijos metu ir neįtraukti į tyrimą, jei buvo pastebėta bet kuri iš šių būklių:

- Bendrosios šlaunies arterijos spindžio skersmuo <5 mm
- Arterinės šakos 2 cm diapazone iki punkcijos vietos
- Reikšminga stenoze 3 cm diapazone nuo punkcijos vietos
- Pirminės įleidiklio movos naudojimas >6Fr
- Punkcija ties šlaunies arterijos išsišakojimu arba distaline kryptimi
- Kelios šlaunies arterijos punkcijos
- Žinoma arba įtariama galinė šlaunies arterijos sienelės punkcija
- Didelė hematoma (2:6 cm) užbaigus procedūrą
- Dėl vingiuoto audinio ar kraujagyslės sunkus pirminės movos įvedimas procedūrai

Šis vieno protokolo tyrimas buvo atliktas dviem dalimis: 1 dalies metu buvo užregistruota 20 pacientų, tuomet atlikta saugos analizė, o 2 dalies metu užregistruota dar 60 pacientų.

1 dalyje vidutinis į tyrimą įtrauktų pacientų amžius buvo 65,9 m., 70,0 % pacientų buvo vyrai, 95 % pacientų tuo pat metu vartojo vaistus. Tyrimo 2 dalyje vidutinis amžius buvo 63,8 m., 78 % buvo vyrai ir 100 % pacientų tuo pat metu vartojo vaistus.

Į tyrimą galėjo būti įtraukti pacientai, kuriems buvo atliekama diagnostika (1 ir 2 dalys) arba intervencinės (2 dalis) širdies kateterizavimo procedūros. Procedūros atitiko kiekvienos tyrime dalyvavusios ligoninės priežiūros, kuri teikiama po FemoSeal™ VCS naudojimo, standartą. Pacientų duomenys buvo renkami tyrimo pradžioje, procedūros metu, 1 dieną ir 30 dienų po procedūros. Rezultatai apibendrinti **1.5 lentelėje** ir rodo, kad FemoSeal™ VCS yra saugu ir veiksminga naudoti šiai pacientų populiacijai.

**1.5 lentelė Klinikiniai rezultatai, gauti tyrimo metu prieš pateikiant į rinką**

|                                                                                                                             | 1 dalis   | 2 dalis                |

| Įtaiso gedimai                                                                                                              | 0 (0 %)   | 6 (10 %)               |

<sup>a</sup>Remiantis bendru imties dydžiu 58, nes 2 pacientai procedūros metu nepasiekė hemostazės dėl ankstesnės ipsilateralinės punkcijos. Šiems pacientams hemostazė buvo pasiekta per 7 ir 37 minutes.

<sup>b</sup>Remiantis bendru imties dydžiu 59: 1 pacientas nebuvo įtrauktas, nes jis dėl plaučių edemos buvo prijungtas prie ventiliacinės sistemos ir negalėjo ambuluoti ilgiau nei savaitę.

<sup>c</sup>Apibrėžta kaip kraujagyslių komplikacija, reikalaujanti kraujo perpylimo arba chirurginio gydymo, arba vietinė infekcija, kurią reikia gydyti antibiotikais, hospitalizuoti arba pailginti hospitalizacijos laiką, arba pašalinti pažeistas ląsteles

1-oje tyrimo dalyje sunkių kraujagyslių komplikacijų nepastebėta. 2-oje tyrimo dalyje nustatyta 1 sunki kraujagyslių komplikacija: pseudoaneurizma, apie kurią pranešta praėjus vienai dienai po procedūros. Įvykis reikalavo ultragarsu valdomo suspaudimo ir trombino injekcijos į pseudoaneurizmą ir prailgino paciento hospitalizaciją.

Iš penkių nepageidaujamų reiškinių, apie kuriuos pranešta 1-oje tyrimo dalyje, buvo 1 galimai su įtaisais susijęs nepageidaujamas reiškinys: nesunkus stipraus kraujavimo atvejis 1-ąją dieną po procedūros. Iš 19 nepageidaujamų reiškinių, apie kuriuos pranešta tyrimo 2 dalyje, buvo pastebėti trys nesunkūs su įtaisais susiję hematomos atvejai ir šeši galimai su įtaisais susiję nesunkūs reiškiniai, įskaitant tris nuolatinio difuzinio kraujavimo atvejus, dvi hematomas ir vienos kojos skausmą po fizinio krūvio.

2 dalyje 3 pacientai buvo laikomi, kuriems nepavyko gydymas: 2 dėl nepasiektos hemostazės nenaudojant kompresijos ir 1 dėl didelės kraujagyslių komplikacijos (pseudoaneurizmos).

1-oje tyrimo dalyje nebuvo gydymo sutrikimų.

Iš šešių 2-oje tyrimo dalyje aprašytų įtaiso gedimų trys netrukdė procedūrai, vienas buvo priskirtas naudotojo klaidai, vienas buvo įleidiklio nuotėkis, o kitas – pažeista užpildo jungtis. Pastarosios dvi problemos buvo išspręstos atlikus į C11202 įdiegtus modelio atnaujinimus.

2-oje klinikinio tyrimo prieš pateikiant rinkai dalyje nepranešama apie 6 mėnesių stebėjimo rezultatus dėl pacientų neatitikimo. Klinikinio tyrimo prieš pateikiant į rinką (EU-SE-001) 30 dienų rezultatai, atitinkantys klinikinėje literatūroje nurodytą stebėjimo laikotarpį, rodo, kad priemonė FemoSeal™ VCS yra saugi ir veiksminga.

### 1.4.2 Klinikinių tyrimų po pateikimo rinkai duomenų santrauka

Buvo atlikti 4 baigtiniai klinikiniai tyrimai po pateikimo į rinką, aprašyti toliau pateiktoje

**1.6 lentelėje.** Šie klinikiniai tyrimai nėra skelbiami ar prieinami internete.

**1.6 lentelė. Po pateikimo į rinką atlikti klinikiniai tyrimai**

2006 m. atliktas tyrimas siekiant patvirtinti dabartinio įtaiso saugumą ir efektyvumą naudojant patobulintą įvedimo sistemą ir gauti grįžtamąjį ryšį apie FemoSeal™ VCS naudojimo instrukcijas ir mokymų programą. Tyrime dalyvavo 100 pacientų, o pirminė vertinamoji baigtis – ar buvo pasiekta hemostazė, ar reikėjo papildomo rankinio ar mechaninio suspaudimo. Šiame tyrime padaryta išvada, kad daugeliu atvejų FemoSeal™ VCS naudojimas buvo sėkmingas (91 % pasiekė neatidėliotiną hemostazę).

2008 m. tyrime dalyvavo 50 pacientų, kurie vertino FemoSeal™ VCS saugumą ir veiksmingumą, kai ji buvo naudojama įprastos klinikinės procedūros metu pacientams, kuriems atliekamas širdies kateterizavimas su 7Fr mova. Pagrindinis tyrimo tikslas buvo surinkti duomenis apie laiką iki hemostazės ir laiką iki ambuliacijos be papildomo suspaudimo – rankinio ar mechaninio. Tyrimo rezultatai parodė, kad vidutinis laikas iki hemostazės buvo 57,8 sekundės, o visi pacientai ambuliavo po 4 valandų poilsio lovoje.

2009 m. atliktas tyrimas buvo skirtas įvertinti naują FemoSeal™ VCS pakuotę. Tyrime dalyvavo 25 pacientai. Pirminė vertinamoji baigtis – ar vartotojas susidūrė su problemomis dėl pakuotės. Vartotojai nepastebėjo jokių problemų dėl naujos FemoSeal™ VCS pakuotės. Šis tyrimas taip pat surinko duomenis apie laiką iki hemostazės.

Šio 2022 tyrimo tikslas – toliau įrodyti FemoSeal™ VCS saugumą ir veiksmingumą, pasiekiant bendrosios šlaunies arterijos (BŠA) prieigos vietų hemostazę realiose tiriamuosiuose, kuriems atliekamos perkutaninės endovaskulinės procedūros. Tyrime dalyvavo 230 pacientai. Pirminiai registro tikslai yra procedūrinė sėkmė (t. y. sėkminga punkcijos vietos hemostazė) ir sunkių komplikacijų (pvz., kraujagyslių pažeidimo, prieigos vietos kraujavimo, prieigos vietos infekcijos, pakartotinio rankinio suspaudimo ir naujos prieigos vietos ipsilateralinės ūminės kojos išemijos) sumažėjimas. Tyrimas parodė, kad FemoSeal™ VCS veiksmingai veikia realioje aplinkoje ir užtikrina veiksmingą hemostazę bei mažą prieigos vietos komplikacijų dažnį pacientams, kuriems atliekamos periferinės endovaskulinės intervencijos. Jis pasižymi geromis eksploatacinėmis savybėmis, trumpu hemostazės laiku ir, pagal atsiliepimus, yra patogus naudoti operatoriui, todėl FemoSeal™ VCS yra vertingas šlaunies prieigos uždarymo įtaisas.

### 1.4.3 Klinikinio stebėjimo po pateikimo rinkai duomenų santrauka

#### 1.4.3.1 Po pateikimo į rinką atlikti klinikiniai tyrimai

Atliktų klinikinių stebėjimų po pateikimo rinkai santrauka pateikiama toliau esančioje 1.7 lentelėje.

**1.7 lentelė Tolesnė klinikinio stebėjimo veikla po pateikimo rinkai**

Terumo Medical Corporation atliko tris aukštos kokybės tyrimus apklausiant priemonę naudojančius gydytojus dabartiniu ataskaitiniu laikotarpiu (2019 m. rugsėjo 1 d. - 2024 m. rugpjūčio 31 d.).

FemoSeal™ klinikinių tyrimų metu buvo renkami aktyvūs klinikiniai duomenys, susiję su FemoSeal™ VCS saugumu ir veiksmingumu klinikinio naudojimo metu. Apklausoje buvo nagrinėjami klausimai apie bendrą prietaisą ir susijusius priedus, įskaitant 0,038 col. kreipiamąją vielą, ir jų tiesioginę sąveiką. Klinikinių kreipiamosios vielos tyrimų metu surinkti aktyvūs klinikiniai duomenys apie saugumą ir veiksmingumą klinikinio 0,038 col. kreipiamosios vielos, tiekiamos su FemoSeal™ VCS, naudojimo metu. Apklausoje metu buvo nagrinėjami klausimai, susiję su bendru kreipiamosios vielos naudojimu, pradedant nuo įvedimo per procedūrinę movą į kraujagyslę iki vielos pašalinimo.

FemoSeal™ VCS ir 0,038 col. kreipiamoji viela, teikiama su įtaisu, gavo visus priimtinius įvertinimus ir šešis (6) nusiskundimus dėl įtaiso bei devynis (9) pranešimus dėl kreipiamosios vielos, pagrįstus aukštos kokybės klinikinių tyrimų pastabų įvertinimu. Skundai buvo įvertinti FemoSeal™ ir kreipiamosios vielos atžvilgiu ir buvo įvertinti kaip Terumo tyrimo po pateikimo rinkai proceso dalis. Naujos rizikos ar rizikos lygių nenustatyta.

Gydytojų naudotojų apklausa buvo atlikta 2024 m. kaip PMCF veiklos dalis. Tyrimo rezultatai parodė, kad FemoSeal™ VCS eksploatacinės savybės ir bendra sauga buvo vertinami labai teigiamai. Buvo įrodytas ir kitų nei standartinių, pateiktų su FemoSeal™ VCS, kreipiamųjų vielų suderinamumas.

#### **1.4.3.2 Nuolatinis arba planuojamas klinikinis stebėjimas po pateikimo rinkai**

TMC turi du vykdomus/ planuojamus klinikinius stebėjimus po pateikimo rinkai. Be to, bus atlikta klinikinė apklausa, kurios metu bus galima gauti grįžtamąjį ryšį, susijusį su ES rinkoje platinamos FemoSeal™ VCS kreipiamosios vielos naudojimu. Apklausą pildys gydytojai, kad būtų galima iširti, kokias kreipiamąsias vielas jie naudojo procedūros metu. Šio tyrimo tikslas - spręsti nustatytą trūkumą, t. y. literatūros ir išorinių ekspertų komentarų apie FemoSeal™ VCS suderinamumą su ne Terumo prekės ženklo kreipiamosiomis vielomis, stoką. Atsiliepimai apima techninius rezultatus, kliniskines charakteristikas ir saugą, susijusius su įtaiso veikimu su skirtingomis kreipiamosiomis vielomis.

#### **1.4.4 Sisteminės literatūros peržiūros duomenų santrauka**

Terumo Medical Corporation atlieka sisteminės literatūros apžvalgas, kad surinktų ir įvertintų klinikinio saugumo ir veiksmingumo duomenis iš paskelbtų tyrimų, susijusių su FemoSeal™ VCS ir (arba) panašių įtaisų. Publikuotos literatūros metinės patikros tikslas - nustatyti anksčiau nežinomus šalutinius poveikius, stebėti žinomus šalutinius poveikius, nustatyti kylančią riziką ir nustatyti galimą sistemingą netinkamą FemoSeal™ VCS naudojimą ar naudojimą ne pagal nurodymus.

Naujausioje sistemingoje literatūros apžvalgoje, kuri apėmė laikotarpį nuo 2019 m. rugsėjo 1 d. iki 2024 m. rugpjūčio 31 d., buvo pateikti 29 paskelbti tyrimai, kuriuose buvo pateikti klinikinio saugumo ir veiksmingumo duomenys apie FemoSeal™ VCS. Dvidešimt trijuose šaltiniuose buvo minimas FemoSeal™ VCS naudojimas pagal paskirtį, o devyniuose tyrimuose buvo minimas naudojimas ne pagal paskirtį. Apskritai literatūros apžvalga apie FemoSeal™ VCS naudojimo tyrimus rodo tiriamą populiaciją, kuri yra tipiška ES pacientams, kuriems atliekamos perkutaninio kraujagyslių kateterizavimo procedūros. Šių 23 recenzuojamų publikacijų, kuriose minimas naudojimas pagal paskirtį, sąrašą žr. **3 skyriuje**.

Klinikinis veiksmingumas buvo įvertintas šiomis priemonėmis:

- Laikas iki hemostazės yra geresnis arba panašus į šiuo metu taikomą poodinio bendrojo šlaunies arterijos uždarymo standartą.

- Laikas iki ambuliacijos yra geresnis už ar panašus į šiuo metu taikomą perkutaninio bendrojo šlaunies arterijos uždarymo standartą.
- Pooperacinių komplikacijų dažnis yra panašus arba mažesnis už dabartinius priežiūros standartus

Remiantis šiomis klinikinėmis veiksmingumo priemonėmis, literatūros apžvalgoje pateikti duomenys parodė, kad FemoSeal™ VCS galima sėkmingai naudoti uždariant šlaunies arterinę punkciją (arteriotomiją) pacientams, kuriems buvo atliktas perkutaninis kateterizavimas naudojant 7Fr ar mažesnę procedūrinę movą. Visiška hemostazė buvo pasiekta daugumai pacientų (79,65-100 %) ir buvo siejama su vidutiniu hemostazės pasiekimo laiku – 0,5 min. bei vidutiniu paciento išrašymo laiku – 3 dienomis. 69,2-86,7 % pacientų galėjo vaikščioti praėjus 5 val. po operacijos, vidutinė pooperacinio lovos režimo trukmė buvo 349 min. FemoSeal™ VCS nesėkmės buvo stebėtos 3,68-4 % atvejų, o papildomo rankinio suspaudimo prireikė 0,9-4,4 % procedūrų.

Klinikinis saugumas buvo įvertintas pagal nepageidaujamus reiškinius, įskaitant, bet neapsiribojant:

- Kraujavimu
- Hematoma
- Pseudoaneurizma
- Kraujosruva
- Arterioveninė fistulė
- Infekcija
- Mirtis

Kiekvienam iš šių nepageidaujamų reiškinių FemoSeal™VCS pasireiškimo dažnis įtrauktuose tyrimuose buvo mažesnis arba panašus į pranešamus dažnius, naudojant rankinį suspaudimą ir kitus kraujagyslių uždarymo įtaisus.

Peržiūrint 10 ligos ataskaitas nenustatyta jokių nepageidaujamų reiškinių, nes nebuvo nustatyta jokios naujos, nenumatytos, atsirandančios ar nepriimtinos rizikos.

Bendras FemoSeal™ VCS naudojimo efektyvumas diagnostinės angiografijos ar intervencinių procedūrų metu priklauso nuo daugelio veiksnių, tokių kaip: lytis, amžius, paciento anatomija, gretutinės ligos, punkcijos vietos anatomicinė padėtis, gydytojo patirtis, kraujagyslių uždarymo įrenginio įvedimo metodas, pooperacinė priežiūra ir kt. Be techninės sėkmės, įskaitant hemostazės pasiekimą, FemoSeal™ VCS taip pat suteikė klinikinę naudą, susijusią su šlaunies arterijos punkcijos vietos uždarymu, taip sutrumpėjo hemostazės pasiekimo laikas ir laikas iki ambuliacijos. FemoSeal™ VCS eksploatacinių savybių rezultatai atitinka tikėtinus šio tipo priemonių rezultatus, kai jos naudojami pagal paskirtį. Kai kuriuose šiuo paieškos laikotarpiu rastuose šaltiniuose

priemonė buvo naudojama ne bendrojoje šlaunies arterijoje, o kitoje anatomicinėje vietoje, taip pat arteriotomijoms, didesnėms nei 7 prancūziškasis dydis, uždaryti – tai laikoma naudojimu ne pagal paskirtį.

Atlikus peržiūrą nebuvo nustatyta jokių nežinomų šalutinių poveikių, atsirandančių rizikų ar galimo sisteminio netinkamo priemonės naudojimo. Tačiau, jei FemoSeal™ VCS atsargiai naudoja išmokyti gydytojai, medicinos priemonė veikia kaip naudinga ir būtina klinikinė priemonė. Bendrais bruožais, tikslinė terapija ir tuo pačiu FemoSeal™ VCS atitinka šiuo metu esantį klinikinį poreikį, susijusį su kraujagyslių prieigos komplikacijų gydymu.

Apskritai šioje literatūros apžvalgoje pateiktais duomenimis nenustatyta jokių anksčiau nežinomų klinikinės aplinkos veiksmingumo ar saugos problemų arba nepageidaujamo poveikio, kuris pasireiškė didesne nei tikėtasi / priimtina apimtimi. Todėl iš šios literatūros apžvalgos galima daryti išvadą, kad priemonė FemoSeal™ VCS, naudojama suspaudimui siekiant pasiekti hemostazę arteriotomijos metu po perkutaninio kateterizavimo, ir toliau veikia taip, kaip tikėtasi, ir nėra susijusi su rimtais saugos įvykiais.

#### 1.4.5 Stebėsenos po pateikimo rinkai duomenų santrauka

Įdiegta aktyvi PMS sistema ir kas mėnesį atliekama visų skundų peržiūra, laikantis vidaus gamybos procedūrų. Skundų duomenys buvo analizuojami laikotarpiu nuo 2019 m. rugsėjo 1 d. iki 2024 m. rugpjūčio 31 d. Iš viso gamintojui buvo pateiktos 28 medicinos priemonių budrumo (MPB) ataskaitos ir 476 klientų skundai. Iš 28 MPB ataskaitų 27 buvo susijusios su nepageidaujamais reiškiniais, o viena su priemonės gedimu. Per ataskaitinį laikotarpį mirė du žmonės, tačiau nė vienas iš praneštų mirčių nebuvo laikomas susijusiu su tiriamąja priemone. Iš 476 gamintojui pateiktų skundų dažniausia skundų priežastis buvo įvedimo sunkumai (146 atvejai, 0,0142 % atvejų dažnis). Ištraukimo sunkumai buvo antras dažniausiai pasitaikantis įvykis, kurio dažnis yra 0,0126 % (130 įvykių).

FemoSeal Vascular Closure System visame pasaulyje parduodama daugiau nei 1 030 136 vienetų, o Europos ekonominėje erdvėje - 827 843 vienetai. Pasauliniais pardavimais grindžiamas apskaičiuotas skundų dažnis yra 0,046 %. Bendras klientų skundų lygis yra labai mažas. Nebuvo nustatyta jokių naujų pavojų, kurie nebūtų įtraukti į naudojimo instrukcijas ir rizikos dokumentus.

Nepageidaujamo šalutinio poveikio pasireiškimo dažnis nurodytas **1.2 lentelėje**. Skunduose nenustatyta jokių naujų nenumatytų, atsirandančių ar nepriimtinių rizikų. Žinomo nepageidaujamo šalutinio poveikio dažnis ir sunkumas reikšmingai nepadidėjo.

#### 1.4.6 Bendra klinikinio veiksmingumo ir saugos santrauka

FemoSeal™ VCS skirta naudoti uždariant bendrąją šlaunies arterijos punkciją (arteriotomiją) pacientams, kuriems buvo atliktas perkutaninis kateterizavimas naudojant 7F (2,33 mm) arba mažesnę procedūrinę movą. Šis klinikinis vertinimas pagrįstas išsamia turimų klinikinų

duomenų prieš pateikimą rinkai ir po pateikimo rinkai bei literatūros, susijusios su numatytuoju „FemoSeal™ VCS“ naudojimu, analize.

Atlikta išsami paskelbtos literatūros apžvalga, apimanti laikotarpį nuo 2019 m. rugsėjo 1 d. iki 2024 m. rugpjūčio 31 d. Įrodymų rinkinyje buvo 29 FemoSeal™ VCS tyrimai. Klinikinio vertinimo metu pateikti įrodymai leidžia daryti išvadą, kad tiriamasis prietaisas yra saugus ir veiksmingas, kai naudojamas kaip nurodyta, o bet kokia rizika ar nepageidaujamas šalutinis poveikis, kuris gali būti susijęs su prietaisu įprastomis naudojimo sąlygomis, yra priimtina rizika, palyginti su nauda pacientui. Tiriamųjų prietaisų veikimo rezultatai atitinka tikėtinus šio tipo prietaisų rezultatus, kai jie naudojami pagal paskirtį.

Galimi nepageidaujami šalutiniai poveikiai, susiję su FemoSeal™ VCS naudojimu, apima nepageidaujamus reiškinius, apie kuriuos paprastai pranešama naudojant alternatyvias arteriotomijos uždarymo priemones, pvz., kraujavimą ir hematomą. Apskritai nepageidaujamų reiškinių, apie kuriuos pranešta naudojant FemoSeal™ VCS, dažnis yra panašus į dažnį, nurodytą naudojant rankinį suspaudimą ir panašius kraujagyslių uždarymo prietaisus. Konkrečiai, kraujavimo ir hematomos dažnis naudojant FemoSeal™ VCS yra mažesnis nei nurodytas panašių kraujagyslių uždarymo prietaisų dažnis. Anksčiau buvo nustatyti visi šalutiniai reiškiniai, apie kuriuos pranešta tiek paskelbtoje literatūroje, tiek stebėjimo po pateikimo rinkai metu (žr. **1.3 skyrių**).

Turimi duomenys apie FemoSeal VCS klinikinę saugą ir veiksmingumą rodo, kad naudojant šį kraujagyslių uždarymo prietaisą paciento nauda yra didesnė už galimą riziką, kai jis naudojamas pagal naudojimo instrukciją.

Kaip nurodyta ankstesniuose skyriuose, FemoSeal™ VCS pateikti duomenys rodo duomenų, susijusių su vertinama priemone, (pvz., priemonės naudojimo, saugos rezultatų, klinikinio veiksmingumo ir klinikinės naudos), nustatytų lygiaverčių priemonių ir duomenų, susijusių su panašiomis priemonėmis, išvardytomis standartinėje praktikoje, nuoseklumą.

Atlikus saugos duomenų kryžminę analizę, nebuvo nustatyta jokių neatitikimų tarp:

- Duomenų, minimų naujausioje mokslo ir technikos srityje
- Vertinamam įrenginiui būdingų duomenų
- Rizikos valdymo faile (-uose) nurodytų duomenų
- Duomenys, nurodyti ženklinime ir (arba) naudojimo instrukcijoje (t. y. pašalinama liekamoji rizika, kuri turi būti perduota naudotojui).

Klinikinis saugumas įrodytas nedideliu komplikacijų dažniu, nustatytu paskelbtoje recenzuojamoje klinikinėje literatūroje, bendrovės remiamuose klinikiniuose tyrimuose, duomenų po pateikimo rinkai apžvalgoje, be pasitraukimo iš rinkos. Nenustatytos jokios problemos dėl veikimo, peržiūroje literatūroje aptiriamas FemoSeal™ VCS naudojimas, kuris atitiko gamintojo numatytąją paskirtį.

## 1.5 Galimos diagnostinės arba gydymo alternatyvos

Rankinis suspaudimas tradiciškai naudojamas hemostazei pasiekti arteriotomijos vietoje po kraujagyslių kateterizavimo. Rankinis suspaudimas buvo susijęs su paciento ilgalaikiu (iki 8 valandų po procedūros) imobilizavimu ir dideliu diskomfortu bei ilgesniu buvimu ligoninėje. Neseniai atliktoje sisteminėje apžvalgoje nustatyta, kad laiko hemostazei pasiekti naudojant rankinę kompresiją mediana buvo 20,8 minutės.<sup>1</sup>

Rankinio suspaudimo alternatyvos apima išorinius hemostatinius prietaisus, kurie mechanškai suspaudžia arteriotomijos vietą. Šie įtaisai nesutrumpina laiko iki hemostazės ar ambuliacijos, bet sumažina personalui keliamus reikalavimus, pakeisdami rankinį suspaudimą mechanine kompresija. Nepageidaujamų reiškinių dažnis, susijęs su mechaninės kompresijos naudojimu, yra panašus į dažnį su rankiniu suspaudimu.

Kraujagyslių uždarymo įtaisai, tokie kaip FemoSeal™ VCS, skirti arteriotomijai uždaryti. Jų tikslas – sutrumpinti laiką iki hemostazės ir sudaryti sąlygas ankstesnei ambuliacijai. Neseniai atlikta sisteminė apžvalga, apimanti 13 komercinių prietaisų, parodė, kad vidutinis laikas hemostazei pasiekti naudojant kraujagyslių uždarymo įtaisą buvo 5,4 minutės. Atskirų kraujagyslių uždarymo įtaisų laiko iki hemostazės mediana svyravo nuo 1 minutės (FemoSeal™ VCS) iki 14 minučių; tuo tarpu daugumos įtaisų buvo nuo 4 iki 10 minučių.<sup>1</sup>

Dažniausiai pranešama apie nepageidaujamus reiškinius, susijusius su arteriotomijos vietos uždarymu, naudojant rankines kompresijas, išorinius hemostatinius įtaisus arba kraujagyslių uždarymo įtaisus, yra hematoma, kraujavimas prieigos vietoje, pseudoaneurizma, arterioveninė fistulė ir infekcija. Ta pati sisteminė apžvalga (34 atsitiktinių imčių kontroliuojami tyrimai, 14 401 pacientas) nustatė, kad nepageidaujamų reiškinių dažnis tarp rankinio suspaudimo ir kraujagyslių uždarymo įtaisų naudojimo buvo panašus, išskyrus tai, kad kraujavimas buvo šiek tiek didesnis naudojant kraujagyslių uždarymo įtaisus.<sup>1</sup>

*1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). Sisteminga atsitiktinių imčių kontroliuojamų tyrimų, kuriuose lyginamas rankinis suspaudimas su kraujagyslių uždarymo prietaisais diagnostinėms ir terapinėms arterijų procedūroms, apžvalga. Tarptautinė chirurgijos technologija, 27, 32–44.*

## 1.6 Siūlomas naudotojo profilis ir mokymai

Kraujagyslių uždarymo sistemos FemoSeal™ Vascular Closure System numatytieji naudotojai yra gydytojai, turintys kvalifikaciją atlikti arterinę prieigą ir uždarymą atliekant endovaskulines procedūras per bendrąją šlaunies arteriją ir dalyvavę Terumo Medical Corporation FemoSeal™ gydytojų mokymo programoje.

## 1.7 Atitinkami darnieji ir bendrieji standartai

Deze samenvatting van de veiligheids- en klinische prestaties (SSCP) is bedoeld om het publiek toegang te bieden tot een bijgewerkte samenvatting van de belangrijkste aspecten van de veiligheid en klinische prestaties van het FemoSeal™ Vascular Closure System (VCS).

Hieronder in **sectie 1.0** volgt een samenvatting van de veiligheids- en klinische prestaties van het apparaat, bedoeld voor gebruikers/zorgprofessionals.

## **1.0 SAMENVATTING VOOR GEBRUIKERS/ZORGPROFESSIONALS**

De SSCP is niet bedoeld als vervanging van de gebruiksaanwijzing als hoofddocument om een veilig gebruik van het hulpmiddel te waarborgen, noch om diagnostische of therapeutische suggesties te geven aan beoogde gebruikers of patiënten. Het SSCP is niet bedoeld als vervanging van de verplichte informatie op de implantaatkaarten of in andere verplichte documenten.

### **1.1 Beoogd gebruik van het apparaat**

#### **1.1.1 Beoogd gebruik**

Het FemoSeal™ Vascular Closure System is een medisch apparaat bestemd voor het sluiten van een arteriële punctie na percutane katheterisatie via de beenslagader.

#### **1.1.2 Gebruiksindicaties**

Het FemoSeal™ Vascular Closure System is geïndiceerd voor gebruik bij het sluiten van de beenslagaderpunctie (arteriotomie) bij patiënten die percutane katheterisatie hebben ondergaan met een 7F (2,33 mm) of kleinere procedurehuls.

#### **1.1.3 Contra-indicaties en/of beperkingen**

FemoSeal™ Vascular Closure System is gecontra-indiceerd bij patiënten met arteriotomieën waarbij hulzen of apparaten groter dan 7F (2,33 mm) zijn gebruikt.

#### **1.1.4 Beoogde patiëntenpopulaties**

De veiligheid en werkzaamheid van het FemoSeal™ Vascular Closure System zijn vastgesteld bij patiënten van 18 jaar en ouder die percutane katheterisatie hebben ondergaan met een 7F (2,33 mm) of kleinere procedurehuls.

#### **1.1.5 Speciale patiëntenpopulaties**

De veiligheid en effectiviteit van het FemoSeal™ Vascular Closure System zijn niet vastgesteld bij de volgende patiëntenpopulaties:

- Patiënten met reeds bestaande auto-immuunziekten.
- Patiënten die therapeutische trombolysen ondergaan.
- Patiënten met klinisch significante perifere vaatziekten.
- Patiënten met ongecontroleerde hypertensie (> 220 mmHg systolisch of > 110 mmHg diastolisch).

- Patiënten met een bloedingsstoornis, waaronder trombocytopenie ( $< 100.000$  bloedplaatjes) of anemie (HgbH  $< 10$  mg/dl).
- Patiënten van wie het binnenlumen van de beenslagader kleiner is dan 5 mm.
- Patiënten met nier- en/of leverfunctiestoornissen.
- Patiënten met andere relevante comorbiditeit.
- Mensen van specifieke raciale en/of etnische afkomst.
- Patiënten met myocardinfarct binnen 72 uur.
- Patiënten met een vasculair transplantaat of stent op het aanprikpunt.
- Zwangere vrouwen of vrouwen die borstvoeding geven.
- Patiënten jonger dan 18 jaar.

### 1.1.6 Beoogd gebruik

De beoogde gebruikers van het FemoSeal™ Vascular Closure System zijn artsen met een opleiding die hen in staat stelt arteriële toegang en sluiting uit te voeren voor endovasculaire procedures via de beenslagader en die hebben deelgenomen aan een instructieprogramma voor artsen van Terumo Medical Corporation FemoSeal™.

## 1.2 Beschrijving van het hulpmiddel

### 1.2.1 Beschrijving van het apparaat

FemoSeal™ Vascular Closure System, vervaardigd door Terumo Medical Corporation (TMC), is een resorbeerbaar vasculair sluitinstrument dat is ontworpen om arteriële hemostase te bereiken na percutane katheterisatie via de beenslagader.

FemoSeal™-sluitelementen bestaan uit twee resorbeerbare polymeerschijven, de binnenafdichting en de buitenste vergrendelschijf, die bij elkaar worden gehouden door een resorbeerbaar multifilament, waardoor de arteriotomie mechanisch wordt afgedicht (zie **Afbeelding 1.1** en **1.2**). Nadat de schijf door de conusbehuizingshuls is ingebracht, wordt de buitenste vergrendelschijf op de multifilamentschacht aangedrukt, wat resulteert in het mechanisch sluiten van het aanprikpunt tussen de binnenste en buitenste vergrendelschijf. De binnenafdichting en de buitenste vergrendelschijf worden op hun plaats gehouden door wrijving op de multifilament-as. Hemostase wordt op mechanische wijze bereikt. De sluitelementen worden aangetast door hydrolyse.

De implanteerbare sluitcomponenten, de binnenafdichting en de buitenste vergrendelschijf worden in achttien (18) maanden tijd afgebroken, terwijl het multifilament naar schatting na twee (2) tot

drie (3) jaar via hydrolyse door het omringende weefsel wordt afgebroken en geresorbeerd. Het vermogen van de implanteerbare sluitcomponenten om compressie op de arteriotomie te handhaven, is tot acht (8) uur getest. De afbraakproducten worden gemetaboliseerd en uitgescheiden in de urine of uitgescheiden als kooldioxide via de longen. In dieronderzoeken zijn geen accumulatie-effecten waargenomen. De extra componenten van FemoSeal™ die tijdens de procedure in contact komen met levend weefsel of bloed zijn de conusbehuizingshuls, dilatator, aandrukhuls, pusher en voerdraad.

**Afbeelding 1.1 Respectievelijk binnenafdichting en buitenste vergrendelschijf**

**Afbeelding 1.2 Aangebrachte binnenafdichting en buitenste vergrendelschijf**

De FemoSeal™ unit is verpakt samen met een dilatator en een 0,038" (0,97 mm) OD, 27,5" (70 cm) lange voerdraad en een J-straightener, zie **Afbeelding 1.3** hieronder. De voerdraad bevindt zich in een slang van polyethyleen. Alle onderdelen zijn verpakt in een vaste papieren tray. De verpakking bevat ook de patiëntimplantaatkaart. Voor het FemoSeal™ Vascular Closure System zijn geen extra accessoires nodig om het hulpmiddel naar behoren te laten werken en het hulpmiddel is alleen bedoeld voor gebruik met de dilatator en voerdraad die in de verpakking van het product zijn meegeleverd.

\* Implanterbaar deel van het apparaat; implanterbare componenten zijn MRI-veilig

FemoSeal™ VCS is gesteriliseerd met ethyleenoxide (EO) en is een medisch apparaat voor eenmalig gebruik. Het FemoSeal™ VCS-apparaat is zo ontworpen dat het niet opnieuw kan worden gebruikt.

### **Werkingsmodus**

De FemoSeal™ VCS bevordert mechanische hemostase door het inzetten van implanterbare sluitelementen binnen en buiten de beenslagader. Het mechanisme dat bloedingen tegengaat, wordt geleverd door de binnenafdichting die het aanprikpunt afdicht en de buitenste vergrendelschijf die de binnenafdichting op zijn plaats houdt.

#### **1.2.3 Klinisch voordeel**

FemoSeal™ VCS biedt de volgende klinische voordelen met betrekking tot vasculaire sluiting na een beenslagaderpunctie:

- Snellere hemostase<sup>1</sup>
- Minder tijd tot ambulantie<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Vorige generatie(s) of varianten

- De eerste versie van FemoSeal™ VCS (#11200) werd in de loop van 2005 en een deel van 2006 op de Europese markt verkocht.
- De huidige FemoSeal™ VCS (#11202), met een verbeterd leveringssysteem, is sinds 28 maart 2006 op de markt.

#### 1.2.5 Accessoires die bedoeld zijn voor gebruik in combinatie met het apparaat

De FemoSeal™ unit is verpakt samen met een dilatator, een 0,038" (0,97 mm) OD, 27,5" (70 cm) lange voerdraad en een J-straightener. De voerdraad is een accessoire van de FemoSeal™ unit. De J-straightener is een component van de voerdraad, terwijl de dilatator een component is van de FemoSeal™ unit. De voerdraad is het enige accessoire dat als accessoire wordt beschouwd. De voerdraad bevindt zich in een slang van polyethyleen. Alle onderdelen zijn verpakt in een vaste papieren tray. De verpakking bevat ook de patiëntimplantaatkaart. Voor het FemoSeal™ Vascular Closure System zijn geen extra accessoires nodig om het hulpmiddel naar behoren te laten werken en het hulpmiddel is alleen bedoeld voor gebruik met de dilatator en voerdraad die in de verpakking van het product zijn meegeleverd.

#### 1.2.6 Andere apparaten en producten die bedoeld zijn voor gebruik in combinatie met het apparaat

Voor FemoSeal™ VCS zijn geen extra apparaten nodig om naar behoren te functioneren.

### 1.3 Risico's en waarschuwingen

#### 1.3.1 Restrisico's en ongewenste effecten

Bekende of te verwachten bijwerkingen, letsels en complicaties in verband met het gebruik van het FemoSeal™ VCS als gevolg van restrisico's zijn vermeld in **Tabel 1.2**.

Het voorvalspercentage is gebaseerd op een analyse van de risicodocumentatie en berekend op basis van post-market surveillancegegevens van 1 september 2019 tot en met 31 augustus 2024. Er zijn geen onbekende restrisico's voor het FemoSeal™ VCS en alle van toepassing zijnde risico's zijn afgewikkeld via de gebruiksaanwijzing en het risicobeheerproces.

**Tabel 1.2. Bijwerkingen/complicaties van FemoSeal**

### 1.3.2 Waarschuwingen en voorzorgsmaatregelen

#### Waarschuwingen

1. Niet gebruiken als de verpakking beschadigd is of als een steriele barrière niet intact is.
2. Niet gebruiken na de uiterste gebruiksdatum; de biologisch afbreekbare componenten werken mogelijk niet naar behoren.
3. Niet gebruiken als een voorwerp beschadigd of defect lijkt.
4. Infecties kunnen optreden indien het FemoSeal™ Vascular Closure System op plaatsen gebruikt wordt waar bacteriële contaminatie van de procedurehuls of het omringende weefsel kan zijn opgetreden.
5. Als het vermoeden bestaat dat de posterieure arteriële wand is doorboord of als er meer dan één arteriële punctie is gemaakt, vertrouw dan niet alleen op het FemoSeal™ Vascular Closure System om arteriële hemostase te bereiken. Gebruik extra handmatige of mechanische compressie.
6. Als het aanprikpunt zich op of distaal van de bifurcatie van de beenslagader bevindt, mag het FemoSeal™ Vascular Closure System niet worden gebruikt vanwege het risico dat de inwendige afdichting verkeerd wordt gepositioneerd. Dit kan leiden tot bloedingsproblemen en/of verstoring van de normale bloedstroom.
7. Bij aanhoudende arteriële bloeding van de incisieplaats mag het multifilament niet worden doorgesneden totdat hemostase is bereikt. Als er geen hemostase wordt bereikt, bevestigt u het multifilament met een steriel wondverband en oefent u aanvullende compressie uit totdat hemostase is bereikt. Bij aanhoudende arteriële bloedingen kunnen aanzienlijke bloedingscomplicaties optreden die letsel of overlijden van de patiënt tot gevolg kunnen hebben.
8. Gebruik het FemoSeal™ Vascular Closure System niet als het aanprikpunt proximale van het liesligament ligt, omdat dit kan leiden tot retroperitoneaal hematoom.
9. Patiënten met een hoger risico op bloedingen kunnen meer bloed verliezen, waardoor een transfusie nodig is.
10. Als de binnenschijf losraakt, kan dit mogelijk een trombotische en/of embolische gebeurtenis veroorzaken.

#### Voorzorgsmaatregelen

1. De plaatsingsprocedure van het FemoSeal™ Vascular Closure System moet worden uitgevoerd door artsen met adequate training in het gebruik van het apparaat.
2. Voer een beperkt femoraal angiogram of een echografisch geleide femorale punctie uit voorafgaand aan de plaatsing van het FemoSeal™ Vascular Closure System.

3. Stop de procedure als:
  - De lumendiameter van de beenslagader < 5 mm is.
  - Stenose en/of significante plaque aanwezig is in de nabijheid van de het aanprikpunt in de beenslagader.
  - Arteriële punctie ter hoogte van, of distaal van de femorale arterie-bifurcatie plaatsvindt.
  - Afwijkende vertakkingen of afwijkingen in het bloedvat die aanwezig zijn in de nabijheid van het aanprikpunt in de beenslagader.
4. Als er een hematoom aanwezig is, moet extra zorg worden besteed aan het correct inbrengen van de conusbehuizingshuls in de arterie.
5. Gebruik een enkele wandsteektechniek. Steek de posterieure wand van de arterie niet door.
6. Neem te allen tijde de steriele manier in acht wanneer u het FemoSeal™ Vascular Closure System gebruikt.
7. Het FemoSeal™ Vascular Closure System is uitsluitend voor eenmalig gebruik en mag op geen enkele wijze opnieuw worden gesteriliseerd of gebruikt. De FemoSeal™ unit is zo ontworpen dat deze niet opnieuw kan worden gebruikt.
8. Als de binnenafdichting onverwacht weerstand ondervindt, moet de procedure worden gestaakt.
9. Om de binnenafdichting correct te plaatsen, moet u uw duim zo verplaatsen dat de knop vrij kan terugveren.
10. Zorg ervoor dat de punt van de conusbehuizingshuls van de FemoSeal™ Unit zich onder het huidoppervlak bevindt voordat de buitenste vergrendelschijf wordt geplaatst. De buitenste vergrendelschijf kan onbedoeld boven huidniveau worden geplaatst bij patiënten met een korte afstand tussen de beenslagader en het huidniveau.
11. Voor een correcte plaatsing kan een incisie in de huid nodig zijn vóór de plaatsing.
12. Als de binnenafdichting zich in de arterie bevindt, maar het niet mogelijk is om de knop volledig in te drukken en de buitenste vergrendelschijf te plaatsen, kan een operatie nodig zijn om de FemoSeal™-sluitelementen te verwijderen.
13. Indien binnen 18 maanden een nieuwe punctie van dezelfde beenslagader nodig is, moet een nieuwe punctie worden uitgevoerd op ten minste één centimeter proximaal van de vorige toegangsplaats van het FemoSeal™ Vascular Closure System.
14. Instrueer de patiënt om de instructies van de arts met betrekking tot de inspectie van de sluitingsplaats op te volgen.

15. Instrueer de patiënt om de patiëntinformatiekaart voor de komende 18 maanden bij zich te dragen

### **Voorzorgsmaatregelen ten tijde van het ontslag**

Beoordeel de patiënt op de volgende klinische condities voordat u overweegt hem/haar te ontslaan:

1. Bloeding en/of hematoom op de sluitingsplaats.
2. Pijn tijdens het lopen.
3. Teken van infectie op de sluitingsplaats.

### **1.3.3 Corrigerende veiligheidsmaatregelen**

In de periode 1 september 2019 tot en met 31 augustus 2024 is er één corrigerende actie in verband met de veiligheid van FemoSeal™ VCS uitgevoerd.

In 2022 heeft Terumo het FemoSeal™ VCS vrijwillig teruggeroepen vanwege klachten over de fouten in de proces- en partijvrijgavetests van het door Elkton vervaardigde FemoSeal-product voor de meting van de opvulkracht en de terugtrekkracht. In totaal werden 950 eenheden uit Zuid-Korea teruggeroepen.

## **1.4 Klinische evaluatie en klinische follow-up na het op de markt brengen**

**Tabel 1.3** bevat een lijst van centrale studies die zijn opgenomen om FemoSeal™ VCS op de markt te brengen, evenals post-market studies en post-market klinische follow-up activiteiten. De versie van het apparaat dat in het onderzoek wordt gebruikt, is in de onderstaande tabel opgenomen. De eerste versie van FemoSeal™ VCS (#11200) was tot 2006 op de markt; de volgende versie (#C11202) werd geïntroduceerd in 2006. Dit is tevens de versie die momenteel op de markt is.

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Uitgevoerd door Biomatech, Frankrijk | Dier-onderzoek | Het doel van het onderzoek was het evalueren van de biocompatibiliteit en biofunctionaliteit van een biologisch afbreekbaar implantaat dat is ontworpen om hemostase in het vasculaire systeem te bereiken. Het geteste hulpmiddel was bestemd om in de punctieopening in de slagaders te komen om hemostase te bereiken. De ene schijf wordt in de punctieopening in de slagader gebracht en de andere schijf vergrendelt de binnenschijf van buiten de slagader. Beide schijven werden ingebracht via een inbrenghuls. De schijven zijn ontworpen om bloedingen te voorkomen, in de vaatwand te genezen en uiteindelijk af te breken en te worden geabsorbeerd. Het onderzoek werd | Implantatieperiode / follow-up is 5 weken voor alle dieren<br><br>4 schapen, 1 varken<br><br>14 sluitelementen<br><br>8 sluitelementen geïmplanteerd in 2 schapen,<br><br>2 sluitelementen geïmplanteerd in 1 varken<br><br>Wanneer twee sluitelementen in dezelfde dijbeenslagader werden geïmplanteerd, zijn ze geïmplanteerd op een afstand van > 30 mm | Alle criteria voor bijwerkingen (ontsteking, necrose, bloeding of andere laesies) of elke dunne pseudo-intimale laagvorming werden geregistreerd. Er werd bijzondere aandacht besteed aan de eerste tissulaire integratie van het apparaat, met speciale nadruk op de interne schijfinkapseling.<br><br>Macroscopisch werden geen significante tekenen van lokale intolerantie of trombusvorming waargenomen. Uit de macroscopische observatie bleek geen verschil tussen het schaap of het varken na implantatie van de sluitelementen in de dijbeenslagaders. Macroscopisch werden geen significante tekenen van lokale intolerantie of trombusvorming waargenomen. Uit de |

|  |  |  | ontwikkeld om gegevens te verzamelen en te analyseren na functionele implantatie bij schapen en varkens om het vermogen van het implantaat te evalueren om de fysiologische functie te behouden bij gebruik in het bloedsomloopstelsel, om de respons van de gastheer en de respons van het hulpmiddel te bepalen (fysieke integriteit, tissulaire inkapseling bij opoffering) en om de afbraak van het implantaat te evalueren |  | <p>macroscopische observatie bleek geen verschil tussen het schaap of het varken na implantatie van de sluitelementen in de dijbeenslagaders.</p> <p>De histopatologische analyse van de implantatieplaats bij schapen toonde geen lokale bijwerkingen aan. De binnenste en buitenste schijven vertoonden tekenen van degradatie en werden in sommige gevallen in kleinere delen gebroken. De binnenste schijven werden volledig geïntegreerd in neo-intimaal weefsel. Bij het varken vertoonde de histopatologische analyse iets meer inflammatoire tekenen rond de binnenste en buitenste schijven. Bij beide dieren vertoonde het multifilament iets meer inflammatoire tekenen dan in het schijfmateriaal, wat normaal is voor gevlochten hechtdraden vanwege het grotere oppervlak.</p> <p>De doorgankelijkheid van het bloedvat werd na 5 weken gemeten met behulp van drie verschillende methoden, histomorfometrisch, histomorfometrisch in combinatie met meting van de vaatlumina met behulp van een schuifmaat en met behulp van een kleurendoppler-echografie. De gemiddelde vaatdoorgankelijkheid bij schapen lag tussen 60 en 80%, afhankelijk van de</p> |

In het kader van het pre-marketontwikkelingsplan voor FemoSeal™ VCS werden drie functionele dierproeven uitgevoerd. In 2000 werd, voorafgaand aan de start van klinische studies, een dieronderzoek uitgevoerd om de biofunctionaliteit van FemoSeal™ VCS te evalueren. Dit onderzoek evalueerde het vermogen van de sluitelementen om de fysiologische functie te behouden en de afbraak ervan te evalueren. Na 18 maanden was het materiaal van de binnen- en buitenschijf niet meer zichtbaar, maar vervangen door een endoluminaal fibreus weefsel. Tot slot werd bevestigd dat het FemoSeal™ VCS-sluitelement in staat is om de fysiologische functie te handhaven wanneer het in de bloedsomloop wordt gebruikt.

In 2002 werd een dierproef uitgevoerd om de biocompatibiliteit en biofunctionaliteit van een biologisch afbreekbaar implantaat, namelijk FemoSeal™ VCS, te evalueren, dat ontworpen is om hemostase in het vasculaire systeem te bereiken. Samengevat was de degradatie van het implantaat na 36 weken bijna voltooid en vond er geen significante nadelige tissulaire reactie plaats.

Een andere dierproef in 2002 evalueerde de biocompatibiliteit en biofunctionaliteit van een biologisch afbreekbaar implantaat, namelijk FemoSeal™ VCS, dat ontworpen is om hemostase in het vasculaire systeem te bereiken. Na 5 weken was de inkapseling van de schijf voltooid en werden tekenen van afbraak waargenomen van de binnen- en buitenschijf. Tot slot werd bevestigd dat het implantaat in staat is de fysiologische functie te behouden wanneer het in de bloedsomloop wordt gebruikt.

Als onderdeel van het klinische ontwikkelingsplan voor FemoSeal™ VCS heeft Radi Medical System AB een klinisch onderzoek uitgevoerd vóór het op de markt brengen. Dit klinisch onderzoek is niet gepubliceerd of online beschikbaar. Het onderzoek met hulpmiddelmodel

#11200 werd uitgevoerd in 2002-2004 volgens de Europese norm EN 540 (Klinisch onderzoek naar medische hulpmiddelen voor mensen) en in overeenstemming met de algemene overwegingen voor klinische proeven van ICH en de richtlijn voor goede klinische praktijken. De details van dit onderzoek worden gedocumenteerd in het verslag EU-SE-001. Het klinische onderzoek werd vastgelegd in het eindverslag van Radi Medical Systems AB, "Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures". Het klinische onderzoek werd uitgevoerd met FemoSeal's eerste model #11200 en was gericht op de veiligheid en effectiviteit van de implanteerbare sluitcomponenten. Het enige verschil tussen het eerste model #11200 en het huidige model, C11202, is respectievelijk de Franse grootte, 6F en 7F, en het verbeterde afgiftesysteem. De klinische voordelen, het beoogde gebruik, de werkingsprincipes en de grondstoffen van de implanteerbare sluitelementen, de binnenafdichting en de buitenste vergrendelschijf blijven ongewijzigd.

Het beoogde gebruik van het apparaat was voor patiënten die diagnostische cardiale of interventionele cardiale procedures ondergingen waarbij de beenslagader als toegangspunt werd gebruikt. Het doel van dit onderzoek was het bepalen van de veiligheid, prestaties en effectiviteit van FemoSeal™ VCS. Dit was een prospectief, multicenter, open-label, eenarmig onderzoek en follow-up na 30 dagen.

Het primaire prestatie-eindpunt was de tijd tot hemostase, gedefinieerd als het ontbreken van hevige bloedingen. Het primaire veiligheidseindpunt was de incidentie van ernstige vasculaire complicaties gedurende 30 dagen. Secundaire eindpunten waren de tijd tot ambulantie, het percentage mislukte behandelingen, de incidentie van ongewenste voorvallen en de prestatiekenmerken van het apparaat tijdens de toediening en implementatie.

Patiënten die aan dit onderzoek deelnamen, waren volwassenen die geïnformeerde toestemming konden geven en die ten minste één intacte pulsatie aan de voeten hebben. Patiënten werden uitgesloten van het onderzoek als ze een van de volgende aandoeningen hadden:

- Voorgeschiedenis van perifere vasculaire aandoeningen
- Auto-immuunziekten
- Bekende bloedingsstoornis van ernstige anemie
- INR >1,5
- Myocardinfarct met 72 uur
- Ongecontroleerde hypertensie ondanks behandeling
- Obesitas die toegang onmogelijk maakt met de Seldinger-techniek
- Aanwezigheid van vasculaire graft of stent op arteriotomieplaats

- Eerdere ipsilaterale punctie binnen 3 maanden
- Levensduurverwachting < 6 maanden

Daarnaast werden patiënten intraoperatief onderzocht en uitgesloten van het onderzoek als een van de volgende situaties werd waargenomen:

- Lumendiameter van beenslagader van <5 mm
- Arteriële takken binnen 2 cm proximaal van het aanprikpunt
- Significante stenose binnen 3 cm van het aanprikpunt
- Gebruik van de primaire inbrenghuls >6 Fr
- Punctie bij of distaal van femorale bifurcatie
- Meerdere femorale puncties
- Bekende of vermoede perforatie van de posterieure femurwand
- Groot hematoom (2:6 cm) na voltooiing van de procedure
- Moeilijke primaire inbrenging van de huls voor de ingreep als gevolg van kronkelig weefsel of bloedvat

Dit onderzoek met één enkel protocol werd in twee delen uitgevoerd: Aan deel 1 namen 20 patiënten deel, waarna er een veiligheidsanalyse werd uitgevoerd. Daarna namen er nog eens 60 patiënten deel aan deel 2.

In deel 1 was de gemiddelde leeftijd van de deelnemende patiënten 65,9 jaar, 70,0% van de patiënten was man en 95% van de patiënten had gelijktijdig medicatie. In deel 2 van het onderzoek was de gemiddelde leeftijd 63,8 jaar, 78% was man en 100% had gelijktijdig medicatie.

Patiënten die diagnostische (deel 1 en deel 2) of interventionele (deel 2) cardiale katheterisatieprocedures ondergingen, kwamen in aanmerking voor deelname aan het onderzoek. De procedures voldeden aan de zorgstandaard in elk van de deelnemende ziekenhuizen, gevolgd door het gebruik van FemoSeal™ VCS. Patiëntgegevens werden verzameld bij de baseline, tijdens de procedure en 1 dag en 30 dagen na de procedure. De resultaten zijn samengevat in **Tabel 1.5** en geven aan dat FemoSeal™ VCS veilig en effectief is voor gebruik bij deze patiëntenpopulatie.

**Tabel 1.5 Klinische resultaten gerapporteerd in de pre-market studie**

|                                                                                                                            | Deel 1       | Deel 2                    |
|----------------------------------------------------------------------------------------------------------------------------|--------------|---------------------------|
| Aantal patiënten                                                                                                           | 20           | 60                        |
| Gemiddelde tijd tot hemostase                                                                                              | 1,2 minuten  | 1,6 minuten <sup>a</sup>  |
| Gemiddelde tijd tot ambulantie                                                                                             | 72,2 minuten | 87,5 minuten <sup>b</sup> |
| Incidentie van ernstige vasculaire complicaties <sup>c</sup>                                                               | 0 (0%)       | 1 (2%)                    |
| Aantal patiënten met bijwerkingen                                                                                          | 5 (25%)      | 19 (32%)                  |
| Falen van de behandeling (gedefinieerd als ernstige vasculaire complicaties, noodzaak tot handmatige compressie, of beide) | 0 (0%)       | 3 (5%)                    |
| Storingen in het apparaat                                                                                                  | 0 (0%)       | 6 (10%)                   |

<sup>a</sup> Gebaseerd op een totale steekproefomvang van 58, omdat 2 patiënten ten tijde van de procedure geen hemostase bereikten vanwege eerdere ipsilaterale puncties. Hemostase werd bereikt na 7 minuten en 37 minuten voor deze patiënten.

<sup>b</sup> Op basis van de totale steekproefgrootte van 59: 1 patiënt werd niet meegerekend omdat deze werd beademd vanwege longoedeem en langer dan een week niet ambulant was.

<sup>c</sup> Gedefinieerd als vasculaire complicatie die bloedtransfusie of chirurgisch herstel vereist, of lokale infectie die toediening van antibiotica, een (verlenging van de) ziekenhuisopname of débridement van de locatie vereist

In deel 1 van het onderzoek werden geen ernstige vasculaire complicaties waargenomen. Er werd één ernstige vasculaire complicatie gemeld in deel 2 van het onderzoek: pseudo-aneurysma dat binnen één dag na de ingreep werd gemeld. Het voorval vereiste echografisch geleide compressie en een injectie van trombine in het pseudo-aneurysma en verlengde de ziekenhuisopname van de patiënt.

Van de vijf bijwerkingen die in deel 1 van het onderzoek werden gemeld, was er één mogelijk aan het apparaat gerelateerde bijwerking: een niet-ernstig voorval van een klapbloeding 1 dag na de procedure. Van de 19 bijwerkingen die in deel 2 van het onderzoek werden gemeld, werden drie aan het apparaat gerelateerde niet-ernstige bijwerkingen van hematoom waargenomen, en er werden zes mogelijk aan het apparaat gerelateerde niet-ernstige voorvallen waargenomen, waaronder drie meldingen van aanhoudend sijpelen, twee hematomen en één keer beenpijn na lichaamsbeweging.

Er waren 3 patiënten in deel 2 die als behandelingsfouten werden beschouwd: 2 vanwege het niet bereiken van hemostase zonder het gebruik van compressie en 1 vanwege de ernstige vasculaire

complicatie (pseudo-aneurysma). In deel 1 van het onderzoek waren er geen mislukte behandelingen.

Van de zes apparaatstoringen in deel 2 van het onderzoek hadden er drie geen invloed op de procedure, één was toe te schrijven aan een gebruikersfout, één was een lekkage van de introducer en één was een gebroken filamentverbinding. De laatste twee problemen werden aangepakt met modelupdates die in C11202 werden geïmplementeerd.

Deel 2 van de pre-market klinische studie rapporteerde de resultaten van de follow-up na 6 maanden niet wegens niet-naleving door de patiënt. De resultaten van de pre-market klinische studie (EU-SE-001) van 30 dagen, die in overeenstemming zijn met de follow-upperiode van de klinische literatuur, tonen aan dat FemoSeal™ VCS veilig en effectief is.

### 1.4.2 Samenvatting van gegevens uit klinische post-market onderzoeken

Er zijn vier voltooide klinische onderzoeken na het in de handel brengen die in onderstaande **Tabel 1.6** worden beschreven. Deze klinische onderzoeken zijn niet gepubliceerd of online beschikbaar.

**Tabel 1.6 Post-market klinische onderzoeken**

| Voltooide post-market klinische onderzoeken                                                 |                              |                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                    |

|--|--|--|--|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Het onderzoek uit 2006 werd uitgevoerd om de veiligheid en effectiviteit van het huidige hulpmiddel te bevestigen met een verbeterd toedieningssysteem en om feedback te krijgen over de gebruiksaanwijzing van FemoSeal™ VCS en het trainingsprogramma. Het onderzoek omvatte 100 patiënten en het primaire eindpunt was of hemostase werd bereikt of dat aanvullende handmatige of mechanische compressies nodig waren. Uit dit onderzoek is gebleken dat de toepassing van FemoSeal™ VCS in de meeste gevallen succesvol was (91% bereikte onmiddellijke hemostase).

In het onderzoek van 2008 waren er 50 deelnemers om de veiligheid en prestaties van FemoSeal™ VCS te beoordelen bij gebruik tijdens een normale klinische routine bij patiënten die een cardiale katheterisatie met een huls van 7 Fr ondergaan. Het primaire eindpunt voor het onderzoek was het verzamelen van gegevens over de tijd tot hemostase en de tijd tot ambulante zonder extra compressie, handmatig of mechanisch. De onderzoeksresultaten concludeerden dat de gemiddelde tijd tot hemostase 57,8 seconden was en dat alle patiënten na 4 uur bedrust ambulant waren.

De studie van 2009 was bedoeld om de nieuwe FemoSeal™ VCS-verpakking te evalueren. Er namen 25 patiënten deel aan het onderzoek. Het primaire eindpunt was of de gebruiker problemen had met de verpakking. De gebruikers gaven aan geen problemen te hebben met de nieuwe FemoSeal™ VCS-verpakking. Dit onderzoek verzamelde ook gegevens voor de tijd tot hemostase.

Het doel van het onderzoek uit 2022 is om de veiligheid en effectiviteit van FemoSeal VCS verder aan te tonen bij het bereiken van hemostase op toegangslocaties in de arteria femoralis (CFA) bij patiënten uit de praktijk die percutane endovasculaire procedures ondergaan. Aan dit onderzoek namen 230 patiënten deel. Primaire eindpunten voor de registratie zijn het slagen van de procedure (d.w.z. succesvolle hemostase van de punctieplaats) en het verminderen van ernstige complicaties (bijv. vasculair letsel, bloedingen gerelateerd aan de toegangsplaats, infectie van de toegangsplaats, herhaalde handmatige compressie en nieuwe ipsilaterale acute beenischemie gerelateerd aan de toegangsplaats). Het onderzoek concludeerde dat de FemoSeal™ VCS goed presteert in reële omgevingen en effectieve hemostase en lage percentages complicaties op de toegangsplaats biedt voor patiënten die perifere endovasculaire interventies ondergaan. Het apparaat heeft goede prestaties met een korte tijd tot hemostase en goede gebruikersfeedback, waardoor FemoSeal™ VCS een waardevol apparaat is voor femorale toegangssluiting.

### 1.4.3 Samenvatting van gegevens uit klinische post-market onderzoeken

#### 1.4.3.1 Voltooide post-market klinische follow up

Een samenvatting van de voltooide klinische post-market follow-upactiviteiten wordt beschreven in **Tabel 1.7** hieronder.

**Tabel 1.7. Klinische post-market follow-upactiviteiten**

Terumo Medical Corporation heeft drie hoogwaardige gebruikersenquêtes onder artsen uitgevoerd tijdens de huidige rapportageperiode (1 september 2019 – 31 augustus 2024).

De FemoSeal™ klinische enquêtes verzamelden proactieve klinische gegevens met betrekking tot de veiligheid en prestaties van FemoSeal™ VCS tijdens klinisch gebruik. Het onderzoek omvatte vragen over het gehele apparaat en de bijbehorende accessoires, waaronder de 0,038" voerdraad en de directe interacties daarvan. De klinische enquêtes over de voerdraad verzamelden proactieve klinische gegevens met betrekking tot veiligheid en prestaties tijdens klinisch gebruik van de 0,038" voerdraad die bij FemoSeal™ VCS wordt geleverd. De vragen waren specifiek gericht op het algemene gebruik van de voerdraad, variërend van het inbrengen via de procedureschacht in het vaatstelsel tot het verwijderen van de draad.

FemoSeal™ VCS en de 0,038" voerdraad die bij het hulpmiddel wordt geleverd, ontvingen alle aanvaardbare beoordelingen en er werden zes (6) klachten ingediend over het hulpmiddel en negen (9) meldingen over de voerdraad op basis van de evaluatie van de opmerkingen die uit de hoogwaardige klinische enquêtes verkregen werd. De klachten zijn beoordeeld voor zowel de

FemoSeal als de voerdraad en zijn beoordeeld als onderdeel van het Terumo-proces voor post-market toezicht. Er werden geen nieuwe risico's en/of risiconiveaus vastgesteld.

In het kader van de PMCF-activiteiten werd in 2024 een gebruikersenquête voor artsen afgerond. De resultaten van het onderzoek toonden aan dat de prestatiebeoordeling en veiligheid van FemoSeal™ VCS over het algemeen zeer gunstig waren. De compatibiliteit van andere voerdraaden dan die standaard bij de FemoSeal™ VCS wordt geleverd, werd ook aangetoond.

#### **1.4.3.2 Voortdurende of geplande post-market klinische follow-up**

TMC heeft twee lopende/geplande post-market klinische follow-upactiviteiten. Daarnaast zal een klinische enquête worden uitgevoerd om toekomstige feedback te verzamelen met betrekking tot het gebruik van de voerdraad die bij FemoSeal VCS wordt geleverd op de EU-markt. De enquête wordt ingevuld door artsen om te onderzoeken welke voerdraaden zij tijdens de procedure hebben gebruikt. Het doel van deze enquête is om een lacune te onderzoeken die is geïdentificeerd als een gebrek aan literatuur en commentaar van externe beoordelaars over de compatibiliteit van FemoSeal™ VCS met voerdraaden van andere merken dan Terumo. De feedback omvat technische resultaten, klinische prestaties en veiligheid met betrekking tot de prestaties van het apparaat met verschillende voerdraaden.

#### **1.4.4 Samenvatting van gegevens uit systematisch literatuuronderzoek**

Terumo Medical Corporation voert systematisch literatuurstudies uit om klinische veiligheids- en prestatiegegevens van gepubliceerde onderzoeken naar FemoSeal™ VCS en/of soortgelijke apparaten te verzamelen en te evalueren. Het doel van de jaarlijkse screening van de gepubliceerde literatuur is het identificeren van eerder onbekende bijwerkingen, het monitoren van bekende bijwerkingen, het identificeren van opkomende risico's en het identificeren van mogelijk systematisch misbruik of off-label gebruik van FemoSeal™ VCS.

In de meest recente systematische literatuurstudie, die betrekking had op de periode van 1 september 2019 tot en met 31 augustus 2024, werden 29 gepubliceerde studies geïdentificeerd die klinische veiligheids- en prestatiegegevens leverden over FemoSeal™ VCS. 23 referenties rapporteerden on-labelgebruik van FemoSeal™ VCS en off-labelgebruik werd gemeld in 9 gevallen. Over het algemeen toont de literatuur over studies die specifiek zijn voor het gebruik van FemoSeal™ VCS zijn gebruikt, een populatie in onderzoek die representatief is voor patiënten in de EU die percutane vasculaire katheterisatieprocedures ondergaan. Zie **sectie 3** voor een lijst van deze 23 on-label peer-reviewed publicaties.

De klinische prestaties werden beoordeeld aan de hand van de volgende maatregelen:

- De tijd tot hemostase is korter dan of vergelijkbaar met de 'state of the art' voor percutane sluiting van de dijslagader.

- Tijd tot ambulantie is korter dan of vergelijkbaar met de 'state of the art' voor percutane sluiting van de dijslagader.
- Het percentage postoperatieve complicaties is vergelijkbaar met of lager dan de huidige zorgstandaarden.

Op basis van deze klinische prestatiemetingen toonden de gegevens in deze literatuurstudie aan dat FemoSeal™ VCS met succes kan worden gebruikt bij het sluiten van de femorale arteriële punctie (arteriotomie) bij patiënten die percutane katheterisatie hebben ondergaan met een 7 Fr of smallere procedureschacht. Volledige hemostase werd bereikt bij de meerderheid van de patiënten (79,65-100%) en werd geassocieerd met een mediane tijd tot hemostase van 0,5 min, gemiddelde tijd tot ontslag van 3 dagen. Tussen 69,2 en 86,7% van de patiënten was na 5 uur in staat op te staan, met een gemiddelde postoperatieve bedtijd van 349 min. FemoSeal™ VCS-falen werd waargenomen in 3,68-4% van de gevallen en bij 0,9-4,4% van de ingrepen was extra handmatige compressie nodig.

De klinische veiligheid werd beoordeeld aan de hand van bijwerkingen, met inbegrip van, maar niet beperkt tot:

- Bloeding
- Hematoom
- Pseudoaneurysma
- Blauwe plekken
- Arterioveneuze fistel
- Infectie
- Overlijden

Voor elk van deze ongewenste voorvallen was de voor FemoSeal™ VCS gemelde frequentie van voorvallen in de opgenomen onderzoeken lager dan of vergelijkbaar met de historisch gemelde frequenties voor handmatige compressie en andere vasculaire sluitinstrumenten.

Er werden geen ongewenste voorvallen vastgesteld bij de beoordeling van 10 procedurerapporten, aangezien er geen nieuwe, onverwachte, opkomende of onaanvaardbare risico's werden vastgesteld.

De algehele effectiviteit van het gebruik van FemoSeal™ VCS tijdens diagnostische angiografie of interventionele operaties hangt af van meerdere factoren, zoals: geslacht, leeftijd, anatomie van de patiënt, comorbiditeiten, anatomische plaatsing van het aanprikpunt, ervaring van de chirurg, plaatsingsmethode van de VCD, postoperatieve zorg, enz. Naast technisch succes, waaronder het bereiken van hemostase, bood FemoSeal™ VCS klinische voordelen met betrekking tot vasculaire sluiting na femorale arteriële punctie, zoals een verkorting van de tijd tot hemostase en een verkorting van de tijd tot ambulantie. De prestatieresultaten van FemoSeal™ VCS komen overeen

met de resultaten die worden verwacht voor dit type apparaat bij beoogd gebruik. Een aantal referenties dat tijdens de huidige zoekperiode werd opgehaald, toonde het gebruik van het onderzoeksinstrument op een andere anatomische locatie dan de dijbeenslagader en voor het sluiten van arteriotomieën > 7 Fr, wat als off-label wordt beschouwd.

Tijdens de beoordeling werden geen onbekende bijwerkingen, opkomende risico's of mogelijk systematisch misbruik van het hulpmiddel vastgesteld. Als het FemoSeal™ VCS echter met zorg wordt gebruikt door getrainde artsen, functioneert het medisch hulpmiddel als een nuttig en noodzakelijk klinisch hulpmiddel. Over het algemeen beantwoordt de doeltherapie en dus FemoSeal™ VCS aan de klinische behoefte die momenteel bestaat bij de behandeling van complicaties in verband met vasculaire toegang.

In het algemeen werden in de gegevens in deze literatuurstudie geen prestatie- of veiligheidsproblemen vastgesteld in de klinische omgeving die eerder niet bekend waren, of schadelijke effecten die zich bij hogere dan verwachte/aanvaardbare percentages voordeden. Daarom kan uit deze literatuurstudie worden geconcludeerd dat FemoSeal™ VCS, indien gebruikt om compressie voor hemostase bij een arteriotomie na percutane katheterisatie te bereiken, naar verwachting blijft werken en niet in verband wordt gebracht met ernstige veiligheidsgebeurtenissen.

#### **1.4.5 Samenvatting van gegevens uit klinische post-market onderzoeken**

Er is een proactief PMS-systeem aanwezig en alle klachten worden maandelijks beoordeeld in overeenstemming met de interne productieprocedures. De klachtgegevens zijn geanalyseerd in de periode van 1 september 2019 tot 31 augustus 2024. In totaal kwamen er 28 Medical Device Vigilance (MDV) Reports en 476 klachtenmeldingen van klanten binnen bij de fabrikant. Van de 28 MDV-rapporten hadden er 27 betrekking op bijwerkingen en één op een storing van het hulpmiddel. Er vonden twee sterfgevallen plaats tijdens de rapportageperiode, maar geen van de gerapporteerde sterfgevallen werd geacht gerelateerd te zijn aan het hulpmiddel. Van de 476 klachten bij de fabrikant waren de meest voorkomende redenen voor de klachten moeilijkheden bij het inbrengen (146 gevallen, 0,0142% incidentiepercentage). De uitvalmodus van pull-outgebeurtenissen is de op één na meest voorkomende met een percentage van 0,0126% (130 gebeurtenissen).

Het FemoSeal™ Vascular Closure System is wereldwijd meer dan 1.030.136 keer verkocht, waarvan 827.843 keer in de Europese Economische Ruimte. De berekende frequentie van klachten op basis van wereldwijde verkoop is 0,046%. Het totale aantal klachten van klanten is zeer laag. Er zijn geen nieuwe risico's geïdentificeerd die niet in de gebruiksaanwijzing en de risicodocumentatie zijn opgenomen.

De frequentie waarmee ongewenste bijwerkingen optreden, wordt weergegeven in **Tabel 1.2**. Er werden door de klachten geen nieuwe onverwachte, opkomende of onaanvaardbare risico's geïdentificeerd. Er waren geen significante toenames in de frequentie of ernst van bekende bijwerkingen.

#### **1.4.6 Algemene samenvatting van klinische prestaties en veiligheid**

FemoSeal™ VCS is geïndiceerd voor gebruik bij het sluiten van de beenslagaderpunctie (arteriotomie) bij patiënten die percutane katheterisatie hebben ondergaan met een 7F (2,33 mm) of kleinere procedurehuls. Deze klinische evaluatie is gebaseerd op een uitgebreide analyse van beschikbare pre- en post-market klinische gegevens en literatuur die relevant zijn voor het beoogde gebruik van FemoSeal™ VCS.

Er is een uitgebreide beoordeling van de gepubliceerde literatuur uitgevoerd voor de periode van 1 september 2019 tot en met 31 augustus 2024. Het bewijsmateriaal omvatte 29 studies voor FemoSeal™ VCS. Het bewijsmateriaal dat in de klinische evaluatie wordt geleverd, concludeert dat het onderzochte apparaat veilig en effectief is wanneer het wordt gebruikt zoals aangegeven en dat alle risico's of ongewenste bijwerkingen die onder normale gebruiksomstandigheden met het apparaat kunnen worden geassocieerd, aanvaardbare risico's vormen wanneer ze worden afgewogen tegen de voordelen voor de patiënt. De prestatieresultaten van de betrokken apparaten komen overeen met de resultaten die worden verwacht voor dit type apparaat bij beoogd gebruik.

De mogelijke ongewenste bijwerkingen die verband houden met het gebruik van FemoSeal™ VCS omvatten de bijwerkingen die ook vaak worden gemeld met alternatieve manieren van sluiting van de arteriotomie, zoals bloeding en hematoom. Over het algemeen zijn de incidentiecijfers voor de bijwerkingen die worden gemeld met het gebruik van FemoSeal™ VCS vergelijkbaar met de cijfers die worden gemeld naar aanleiding van handmatige compressie en vergelijkbare vasculaire sluitinstrumenten. Specifiek, voor bloedingen en hematoom, zijn de gerapporteerde percentages voor FemoSeal™ VCS lager dan de gerapporteerde percentages voor vergelijkbare vasculaire sluitinstrumenten. Elk van de gemelde ongewenste voorvallen, zowel uit de gepubliceerde literatuur als uit het post-market toezicht, was reeds eerder geïdentificeerd (zie **Section 1.3**).

De bestaande gegevens met betrekking tot de klinische veiligheid en prestaties van FemoSeal VCS suggereren dat de voordelen van het gebruik van dit vasculaire sluitinstrument voor de patiënt zwaarder wegen dan mogelijke risico's wanneer het wordt gebruikt in overeenstemming met de gebruiksaanwijzing.

Zoals aangegeven in de voorgaande paragrafen, tonen de gegevens die worden verstrekt voor FemoSeal™ VCS de consistentie aan tussen de gegevens met betrekking tot het te evalueren hulpmiddel (bijv. gebruik van het hulpmiddel, veiligheidsresultaten, klinische prestaties en klinische voordelen), geïdentificeerde gelijkwaardige hulpmiddelen en de gegevens met betrekking tot vergelijkbare hulpmiddelen conform de 'state of the art'.

Uit de kruisanalyse van veiligheidsgegevens zijn geen hiaten gebleken tussen:

- Gegevens conform de state of the art
- Specifieke gegevens van het te evalueren hulpmiddel

- Gegevens vermeld in risicobeheerdossier(s)
- Gegevens vermeld in de etikettering en/of gebruiksaanwijzing (d.w.z. restrisiko's die aan de gebruiker moeten worden gemeld).

Klinische veiligheid is aangetoond door lage aantallen complicaties die zijn geïdentificeerd in de gepubliceerde peer-reviewed klinische literatuur, door het bedrijf gesponsorde klinische studies, beoordeling van de post-market gegevens in combinatie met geen terugtrekkingen uit de markt. Er zijn geen problemen met de prestaties vastgesteld. De literatuur bevatte het gebruik van FemoSeal™ VCS dat overeenstemde met het beoogde gebruik van de fabrikant.

### **1.5 Mogelijke diagnostische of therapeutische alternatieven**

Handmatige compressie wordt traditioneel gebruikt om hemostase te bereiken op de arteriotomieplaats na vasculaire katheterisatie. Handmatige compressie wordt in verband gebracht met langdurige immobilisatie van de patiënt (tot 8 uur na een ingreep) en met aanzienlijk ongemak en langdurig ziekenhuisverblijf. Uit een recente systematische evaluatie bleek dat de mediane tijd om hemostase te bereiken met handmatige compressie 20,8 minuten was.<sup>1</sup>

Alternatieven voor handmatige compressie zijn onder meer externe hemostatische apparaten die mechanische compressie toepassen op de arteriotomieplaats. Deze apparaten verkorten de tijd tot hemostase of de tijd tot ambulante niet, maar verlagen de personeelsbehoefte door handmatige compressie te vervangen door mechanische compressie. De frequentie van bijwerkingen die verband houden met het gebruik van mechanische compressie is vergelijkbaar met die van handmatige compressie.

Vasculaire sluitinstrumenten, zoals FemoSeal™ VCS, zijn ontworpen om de arteriotomie te sluiten. Ze zijn bedoeld om de tijd tot hemostase te verkorten en eerdere ambulante mogelijk te maken. Uit een recente systematische evaluatie met 13 in de handel verkrijgbare hulpmiddelen, bleek dat de mediane tijd om hemostase te bereiken 5,4 minuten was met een vasculair sluitinstrument. De mediane hemostasetijd van het afzonderlijke vasculaire sluitinstrument varieerde van 1 minuut (FemoSeal™ VCS) tot 14 minuten; het merendeel van de instrumenten zat tussen 4 en 10 minuten.<sup>1</sup>

Vaak gemelde bijwerkingen in verband met sluiting van de arteriotomieplaats, met handmatige compressie, externe hemostatische apparaten of vasculaire sluitinstrumenten, zijn onder meer hematoom, bloeding op de toegangsplaats, pseudo-aneurysma, arterioveneuze fistel en infectie. Uit dezelfde systematische evaluatie (34 gerandomiseerde gecontroleerde onderzoeken, 14.401 patiënten) bleek dat het aantal ongewenste voorvallen vergelijkbaar was tussen handmatige compressie en het gebruik van vasculaire sluitinstrumenten, met de uitzondering dat bloedingen doorgaans iets vaker voorkwamen bij vasculaire sluitinstrumenten.<sup>1</sup>

## 1.6 Voorgesteld gebruikersprofiel en training

De beoogde gebruikers van het FemoSeal™ Vascular Closure System zijn artsen met een opleiding die hen in staat stelt arteriële toegang en sluiting uit te voeren voor endovasculaire procedures via de beenslagader en die hebben deelgenomen aan een instructieprogramma voor artsen van Terumo Medical Corporation FemoSeal™.

Denne oppsummeringen av sikkerhet og klinisk ytelse er ment å gi offentlig tilgang til en oppdatert oppsummering av hovedaspektene ved sikkerheten og den kliniske ytelsen til FemoSeal™ Vascular Closure System (VCS).

En oppsummering av enhetens sikkerhet og kliniske ytelse, beregnet på brukere/helsepersonell, er tilgjengelig nedenfor i **Avsnitt 1.0**.

## **1.0 OPPSUMMERING FOR BRUKERE/HELSEPERSONELL**

Oppsummeringen av sikkerhet og klinisk ytelse er ikke ment å erstatte bruksanvisningen som hoveddokument for å sikre sikker bruk av enheten, og er heller ikke ment å gi diagnostiske eller terapeutiske forslag til tiltenkte brukere eller pasienter. Oppsummeringen av sikkerhet og klinisk ytelse er ikke ment å erstatte den obligatoriske informasjonen på implantatkortene eller i andre obligatoriske dokumenter.

### **1.1 Tiltent bruk av utstyret**

#### **1.1.1 Bruksområde**

FemoSeal™ Vascular Closure System er en medisinsk enhet som er ment for lukking av en arteriell punksjon etter perkutan kateterisering gjennom hovedlårarterien (arteria femoralis communis).

#### **1.1.2 Bruksindikasjoner**

FemoSeal™ Vascular Closure System er indisert for bruk til lukking av punksjon i hovedlårarterien (arteriotomi) hos pasienter som har gjennomgått perkutan kateterisering med en prosedyrehylse på 7 F (2,33 mm) eller mindre.

#### **1.1.3 Kontraindikasjoner og/eller begrensninger**

FemoSeal™ Vascular Closure System er kontraindisert hos pasienter med arteriotomier der det er brukt hylser eller enheter som er større enn 2,33 mm (7 F).

#### **1.1.4 Tiltent pasientpopulasjon**

Sikkerheten og effekten til FemoSeal™ Vascular Closure System er fastslått hos pasienter på 18 år og eldre som har gjennomgått perkutan kateterisering ved bruk av en prosedyrehylse på 7 F (2,33 mm) eller mindre.

#### **1.1.5 Spesielle pasientpopulasjoner**

Sikkerheten og effekten til FemoSeal™ Vascular Closure System er ikke fastslått i følgende pasientpopulasjoner:

- Pasienter med eksisterende autoimmun sykdom.
- Pasienter som gjennomgår terapeutisk trombolyse.
- Pasienter med klinisk signifikant perifer karsykdom.
- Pasienter med ukontrollert hypertensjon (> 220 mmHg systolisk eller > 110 mmHg diastolisk).

- Pasienter med blødersykdom, inkludert trombocytopeni ( $< 100\,000$  blodplater) eller anemi (Hgb  $< 10$  mg/dl).
- Pasienter med et indre lumen i hovedlårarterien som er mindre enn 5 mm.
- Pasienter med nedsatt nyre- og/eller leverfunksjon.
- Pasienter med annen relevant komorbiditet.
- Populasjoner med spesifikke rasemessige og/eller etniske opprinnelser.
- Pasienter med hjerteinfarkt innen 72 timer.
- Pasienter med et vaskulært transplantat eller en stent på punksjonsstedet.
- Pasienter som er gravide eller ammer.
- Pasienter under 18 år.

### 1.1.6 Tiltente brukere

Tiltente brukere av FemoSeal™ Vascular Closure System er leger med opplæring som kvalifiserer dem til å utføre arteriell tilgang og lukking for endovaskulære prosedyrer gjennom hovedlårarterien, og som har deltatt i et legeinstruksjonsprogram for Terumo Medical Corporation FemoSeal™.

## 1.2 Beskrivelse av utstyret

### 1.2.1 Beskrivelse av utstyret

FemoSeal™ Vascular Closure System, produsert av Terumo Medical Corporation (TMC), er en resorberbar vaskulær lukkeenhet designet for å oppnå femoral arteriell hemostase etter perkutan kateterisering gjennom hovedlårarterien.

FemoSeal™ lukkeelementer består av to resorberbare polymerskiver, den indre forseglingen og den ytre sperreskiven, som holdes sammen av et resorberbart multifilament og dermed forsegler arteriotomien mekanisk (se **Illustrasjon 1.1** og **Illustrasjon 1.2**). Etter å ha blitt plassert gjennom den koniske ytterhylsen, blir den ytre sperreskiven presset på multifilamentskaftet, noe som fører til mekanisk lukking av punksjonsstedet mellom den indre og ytre sperreskiven. Den indre tetningen og den ytre sperreskiven holdes på plass via friksjon på multifilamentskaftet. Hemostase oppnås ved hjelp av mekaniske midler. Lukkeelementene brytes ned ved hydrolyse.

De implanterbare lukkekomponentene, den indre forseglingen og den ytre sperreskiven brytes ned i løpet av atten (18) måneder, mens multifilamentet anslås å bli brutt ned og absorbert via hydrolyse av omkringliggende vev etter to (2) til tre (3) år. De implanterbare lukkekomponentenes evne til å opprettholde kompresjon på arteriotomien er testet ved opptil åtte (8) timer.

Nedbrytningsproduktene metaboliseres og skilles ut i urinen eller går ut som karbondioksid via lungene. Ingen akkumuleringseffekter er observert i dyrestudier. De andre komponentene i FemoSeal™ som vil komme i kontakt med levende vev eller blod under prosedyren, er den koniske ytterhylsen, dilatoren, komprimeringsslangen, pusheren og guidewiren.

### Illustrasjon 1.1 Henholdsvis indre tetning og ytre sperreskive

### Illustrasjon 1.2 Plassert indre tetning og ytre sperreskive

FemoSeal™-enheten er pakket sammen med en dilator og en guidewire med 0,038" (0,97°mm) UD, 27,5" (70°cm) lengde og en J-utretter, se **Illustrasjon 1.3** nedenfor. Guidewiren ligger i en polyetylenslange. Alle delene er pakket på et fast papirbrett. Emballasjen inneholder også pasientens implantatkort. FemoSeal™ Vascular Closure System krever ikke ekstra tilbehør for at enheten skal fungere som tiltenkt, og enheten er kun ment for bruk med dilatoren og guidewiren som er inkludert i produktets emballasje.

\*Implanterbar del av enheten; implanterbare komponenter er MR-sikre

FemoSeal™ VCS er sterilisert med etylenoksid (EO), og er medisinsk engangsutstyr. FemoSeal™ VCS-enheten er utformet slik at den ikke kan gjenbrukes.

### **Virkemåte**

FemoSeal™ VCS fremmer mekanisk hemostase ved å plassere implanterbare lukkeelementer inne i og utenfor hovedlårarterien. Mekanismen som forhindrer blødning, består av den indre tetningen som forsegler punksjonsstedet, og den ytre sperreskiven som holder den indre tetningen på plass.

### **1.2.3 Klinisk fordel**

FemoSeal™ VCS gir følgende kliniske fordeler med tanke på vaskulær lukking etter punksjon av hovedlårarterien:

- Kortere tid til hemostase<sup>1</sup>
- Kortere tid til ambulerings<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Tidligere generasjon(er) eller varianter

- Den første versjonen av FemoSeal™ VCS (#11200) ble solgt på det europeiske markedet i 2005 og deler av 2006.
- Den nåværende FemoSeal™ VCS (#11202), med et forbedret innføringssystem, har vært på markedet siden 28. mars 2006.

#### 1.2.5 Tilbehør som er ment for bruk i kombinasjon med enheten

FemoSeal™-enheten er pakket sammen med en dilator, en guidewire med 0,97 mm (0,038") OD og 70 cm (27,5") lengde, og en J-utretter. Guidewiren er tilbehør til FemoSeal™-enheten. J-utretteren er en komponent i guidewiren, mens dilatoren er en komponent i FemoSeal™-enheten. Guidewiren er det eneste tilbehøret som vurderes. Guidewiren ligger i en polyetylenslange. Alle delene er pakket på et fast papirbrett. Emballasjen inneholder også pasientens implantatkort. FemoSeal™ Vascular Closure System krever ikke ekstra tilbehør for at enheten skal fungere som tiltenkt, og enheten er kun ment for bruk med dilatoren og guidewiren som er inkludert i produktets emballasje.

#### 1.2.6 Andre enheter og produkter som er ment for bruk i kombinasjon med enheten

FemoSeal™ VCS krever ikke ekstra utstyr for å fungere som tiltenkt.

### 1.3 Risiko og advarsler

#### 1.3.1 Restrisiko og bivirkninger

Kjente eller forutsigbare bivirkninger, skader og komplikasjoner forbundet med bruk av FemoSeal VCS Vascular Closure Device som følge av restrisiko er oppført i **Tabell 1.2**. Forekomstraten er basert på en analyse av risikodokumentasjonen og beregnet på grunnlag av overvåkingsdata etter markedsføring fra 1. september 2019 til og med 31. august 2024. Det er ingen ukjente restrisikoer for FemoSeal™ VCS, og alle gjeldende risikoer er håndtert gjennom bruksanvisningen og risikostyringsprosessen.

**Tabell 1.2. Bivirkninger/komplikasjoner med FemoSeal**

| Skade                                           | Forekomstrate (%) | Risikoreduserende faktorer                                                                                                                              |

### 1.3.2 Advarsler og forsiktighetsregler

#### Advarsler

1. Må ikke brukes hvis emballasjen er skadet eller hvis en steril barriere ikke er intakt.
2. Må ikke brukes etter utløpsdatoen – de biologisk nedbrytbare komponentene vil kanskje ikke fungere som de skal.
3. Må ikke brukes hvis noen av delene ser ut til å være skadet eller defekte.
4. Bruk av FemoSeal™ Vascular Closure System der det kan ha oppstått bakteriell kontaminering av prosedyrehylsen eller det omkringliggende vevet, kan forårsake infeksjon.
5. Hvis det er mistanke om at den posteriore arterieveggen er punktert eller at det er utført mer enn én arteriell punksjon, skal du ikke stole på bare FemoSeal™ Vascular Closure System for å oppnå arteriell hemostase. Bruk ytterligere manuell eller mekanisk kompresjon.
6. Hvis punksjonsstedet er ved eller distalt til forgreningen av femoralarterien, skal FemoSeal™ Vascular Closure System ikke brukes på grunn av risikoen for at den indre tetningen plasseres feil. En slik hendelse kan føre til blødningskomplikasjoner og/eller forstyrrelse av den normale blodgjennomstrømningen.
7. Hvis det er vedvarende arteriell blødning fra innsnittstedet, må multifilamentet ikke kuttes før hemostase er oppnådd. Hvis hemostase ikke oppnås, festes multifilamentet med en steril sårbandasje og tilleggskompresjon påføres inntil hemostase er oppnådd. Ved vedvarende arteriell blødning kan det oppstå betydelige blødningskomplikasjoner som kan føre til pasientskade eller død.
8. Ikke bruk FemoSeal™ Vascular Closure System hvis punksjonsstedet er proksimalt for lyskebandet, da dette kan føre til retroperitonealt hematom.
9. Pasienter med høyere risiko for blødning kan få økt blodtap som krever blodoverføring.
10. Hvis den indre skiven løsner, kan det potensielt forårsake en trombotisk og/eller embolisk hendelse.

#### Forholdsregler

1. Plasseringsprosedyren for FemoSeal™ Vascular Closure System skal utføres av leger med tilstrekkelig opplæring i bruk av enheten.
2. Utfør et begrenset femoralt angiogram eller en ultralydveiledet femoralspunksjon før bruk av FemoSeal™ Vascular Closure System.
3. Avbryt prosedyren hvis:

- hovedlårarteriens lumendiameter er  $< 5$  mm.
  - det er stenose og/eller betydelig plakk i nærheten av punksjonsstedet til hovedlårarterien.
  - det er arteriepunksjon ved, eller distalt til, forgreningen av hovedlårarterien.
  - det er uregelmessige grener eller blodkar i nærheten av punksjonsstedet til hovedlårarterien.
4. Hvis det forekommer hematom, må det utvises ekstra forsiktighet for å sikre riktig innføring av den koniske ytterhylsen i arterien.
  5. Bruk punksjonsteknikk for én karvegg. Ikke punkter arteriens bakre karvegg.
  6. Bruk alltid steril teknikk ved bruk av FemoSeal™ Vascular Closure System.
  7. FemoSeal™ Vascular Closure System er kun til engangsbruk, og skal ikke resteriliseres eller gjenbrukes på noen måte. FemoSeal™-enheten er utformet slik at den ikke kan gjenbrukes.
  8. Hvis plasseringen av den indre tetningen møter uventet motstand, må prosedyren avbrytes.
  9. For korrekt plassering av det indre seglet, flytt tommelen slik at knappen kan sprette fritt tilbake.
  10. Sørg for at spissen på den koniske ytterhylsen på FemoSeal™-enheten er under hudoverflaten før den ytre sperreskiven plasseres. Den ytre sperreskiven kan utilsiktet bli plassert over hudnivå hos pasienter med kort avstand mellom lårarterien og hudnivået.
  11. For riktig plassering kan det være nødvendig med et hudinnsnitt før plassering.
  12. Hvis den indre tetningen er inne i arterien, men det ikke er mulig å trykke knappen helt inn og plassere den ytre sperreskiven, kan det være nødvendig med kirurgi for å fjerne lukkeelementene til FemoSeal™.
  13. Hvis det blir nødvendig med ny punksjon av den samme lårarterien innen 18 måneder, skal den nye punksjon utføres minst én centimeter proksimalt for det forrige tilgangsstedet for FemoSeal™ Vascular Closure System.
  14. Be pasienten følge legens anvisninger angående inspeksjon av lukkestedet.
  15. Be pasienten ha med seg pasientinformasjonskortet i de neste 18 månedene

### **Forholdsregler ved utskriving**

Før utskriving vurderes, må pasienten vurderes for følgende kliniske tilstander:

1. Blødning og/eller hematom på lukkestedet.

2. Smerte ved gange.
3. Tegn på infeksjon ved lukkestedet.

### 1.3.3 Korrigerende feltsikkerhetstiltak

Det var ett korrigerende feltsikkerhetstiltak som involverte FemoSeal™ VCS i perioden fra 1. september 2019 til og med 31. august 2024.

I 2022 tilbakekalte Terumo frivillig FemoSeal™ VCS på grunn av klager på feil i prosess- og partifrigjørings tester av Elkton-produserte FemoSeal-produkter for måling av støtkraft og tilbaketrekingskraft. Totalt ble 950 enheter tilbakekalt fra Sør-Korea.

## 1.4 Oppsummering av klinisk evaluering og klinisk oppfølging etter markedsføring

**Tabell 1.3** inkluderer en liste over vesentlige studier som er inkludert for å lansere FemoSeal™ VCS på markedet, samt studier etter markedsføring og kliniske oppfølgingsaktiviteter etter markedsføring. Enhetsversjonen som ble anvendt i studien, er inkludert i tabellen nedenfor. Den første versjonen av FemoSeal™ VCS (#11200) var på markedet frem til 2006, mens den neste versjonen (#C11202) ble lansert på markedet i 2006 og er den som er på markedet i dag.

**Tabell 1.3 Oppsummering av vesentlige studier**

| Funksjonell dyretesting før markedsføring                                                                                                                                                                                                                               | Enhetsversjon               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vasculature System. Functional Implantation Test in Sheep 12-, 15-, and 18-month Time Periods. (R1051-1), 2000, Radi Medical System AB (performed by Biomatech, France). | 11200                       |
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep 12-, 24-, and 36-Week Time-Periods. (R1050-1), 2002, Radi Medical System AB (performed by Biomatech, France). | 11200                       |
