This Summary of Safety and Clinical Performance (SSCP) is intended to provide public access to an updated summary of the main aspects of the safety and clinical performance of the FemoSeal™ Vascular Closure System (VCS).

A summary of the safety and clinical performance of the device, intended for users / healthcare professionals, is provided below, in **Section 1.0**.

## **1.0 SUMMARY FOR USERS / HEALTHCARE PROFESSIONALS**

The SSCP is not intended to replace the Instructions for Use as the main document to ensure the safe use of the device, nor is it intended to provide diagnostic or therapeutic suggestions to intended users or patients. The SSCP is not intended to replace the mandatory information on the implant cards or in any other mandatory documents.

### **1.1 Intended Use of the Device**

#### **1.1.1 Intended Use**

FemoSeal™ Vascular Closure System is a medical device intended for closure of an arterial puncture after percutaneous catheterization through the common femoral artery.

#### **1.1.2 Indications for Use**

FemoSeal™ Vascular Closure System is indicated for use in closing the common femoral arterial puncture (arteriotomy) in patients who have undergone percutaneous catheterization using a 7F (2.33 mm) or smaller procedural sheath.

#### **1.1.3 Contraindications and/or Limitations**

FemoSeal™ Vascular Closure System is contraindicated in patients with arteriotomies in which sheaths or devices larger than 7F (2.33 mm) have been used.

#### **1.1.4 Target Patient Populations**

The safety and effectiveness of FemoSeal™ Vascular Closure System has been established in patients 18 years of age and older who have undergone percutaneous catheterization using a 7F (2.33 mm) or smaller procedural sheath.

#### **1.1.5 Special Patient Populations**

The safety and effectiveness of FemoSeal™ Vascular Closure System has not been established in the following patient populations:

- Patients with pre-existing autoimmune disease.
- Patients undergoing therapeutic thrombolysis.
- Patients with clinically significant peripheral vascular disease.
- Patients with uncontrolled hypertension (> 220 mmHg systolic or > 110 mmHg diastolic).
- Patients with a bleeding disorder, including thrombocytopenia (< 100,000 platelet count), or anemia (Hgb < 10 mg/dl).
- Patients having an inner lumen of the common femoral artery smaller than 5 mm.

- Patients with renal and/or hepatic impairment.
- Patients with other relevant co-morbidity.
- Population with specific racial and/or ethnic origins.
- Patients with myocardial infarction within 72 hours.
- Patients with a vascular graft or stent at the puncture site.
- Patients who are pregnant or lactating.
- Patients below the age of 18 years.

### **1.1.6 Intended Users**

FemoSeal™ Vascular Closure System's intended users are physicians with training qualifying them to perform arterial access and closure for endovascular procedures through the common femoral artery and have participated in a Terumo Medical Corporation FemoSeal™ physician instruction program.

## **1.2 Device Description**

### **1.2.1 Description of the Device**

FemoSeal™ Vascular Closure System, manufactured by Terumo Medical Corporation (TMC), is a resorbable vascular closure device designed to achieve femoral arterial hemostasis after percutaneous catheterization through the common femoral artery.

FemoSeal™ closure elements consist of two resorbable polymer discs, the inner seal and the outer locking disc, which are held together by a resorbable multifilament, thereby mechanically sealing the arteriotomy (see **Figure 1.1** and **Figure 1.2**). After being deployed through the cone housing sheath, the outer locking disc is tamped onto the multifilament shaft resulting in mechanical closure of the puncture site between the inner and outer locking disc. The inner seal and outer locking disc are held in place via friction on the multifilament shaft. Hemostasis is achieved by mechanical means. The closure elements are degraded by hydrolysis.

The implantable closure components, inner seal and outer locking disc, are degraded in eighteen (18) months while the multifilament is estimated to be degraded and absorbed via hydrolysis by surrounding tissue after two (2) to three (3) years. The ability of the implantable closure components to maintain compression on the arteriotomy has been tested at up to eight (8) hours. The degradation products are metabolized and excreted in the urine or expired as carbon dioxide via the lungs. No accumulation effects have been observed in animal studies. The additional

components of FemoSeal™ that will come in contact with living tissue or blood during the procedure are the cone housing sheath, dilator, tamping tube, pusher and the guidewire.

**Figure 1.1 Inner Seal and Outer Locking Disc, Respectively**

**Figure 1.2 Inner Seal and Outer Locking Disc Deployed**

The FemoSeal™ unit is packaged together with a dilator and a 0.038” (0.97 mm) OD, 27.5” (70 cm) length guidewire and a J-straightener, see **Figure 1.3** below. The guidewire is contained within a polyethylene tube. All parts are packaged in a fixed paper tray. The packaging also includes the patient implant card. The FemoSeal™ Vascular Closure System does not require additional accessories for the device to function as intended and the device is only intended to be used with the dilator and guidewire included within the product’s packaging.

Figure 1.3 FemoSeal™ VCS Unit with the Guidewire and Dilator

1.2.2 Raw Materials & Components

Table 1.1 below list the components of the FemoSeal™ VCS.

Table 1.1 FemoSeal™ VCS Raw Materials and Components

| Part Number | Description                                                |                                                 | Materials                                                                                                                                                                    |

\* Implantable portion of device; implantable components are MRI safe

FemoSeal™ VCS is sterilized via Ethylene Oxide (EO) and is a single-use medical device. The FemoSeal™ VCS device is designed in such a manner that it cannot be re-used.

### **Mode of Action**

The FemoSeal™ VCS promotes mechanical hemostasis by deploying implantable closure elements inside and outside the common femoral artery. The mechanism that prevents bleeding is provided by the inner seal which seals the puncture site, and the outer locking disc which holds the inner seal in position.

### 1.2.3 Clinical Benefit

FemoSeal™ VCS provides the following clinical benefits relative to vascular closure after common femoral arterial puncture:

- Reduction in time to hemostasis<sup>1</sup>
- Reduction in time to ambulation<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### 1.2.4 Previous Generation(s) or Variants

- The first version of FemoSeal™ VCS (#11200) was sold on the European market during the year 2005 and part of 2006.
- The current FemoSeal™ VCS (#11202), with an improved delivery system, has been on the market since March 28, 2006.

### 1.2.5 Accessories Intended to Be Used in Combination with the Device

The FemoSeal™ unit is packaged together with a dilator, a 0.038” (0.97 mm) OD, 27.5” (70 cm) length guidewire and a J-straightener. The guidewire is an accessory of the FemoSeal™ unit. The J-straightener is a component of the guidewire, while the dilator is a component of the FemoSeal™ unit. The guidewire is the only considered accessory. The guidewire is contained within a polyethylene tube. All parts are packaged in a fixed paper tray. The packaging also includes the patient implant card. The FemoSeal™ Vascular Closure System does not require additional accessories for the device to function as intended and the device is only intended to be used with the dilator and guidewire included within the product’s packaging.

### 1.2.6 Other Devices and Products Intended to Be Used in Combination with the Device

The FemoSeal™ VCS does not require additional devices to function as intended.

## 1.3 Risks and Warnings

### 1.3.1 Residual Risks and Undesirable Effects

Known or foreseeable adverse events, harms and complications associated with the use of the FemoSeal™ VCS as a result of residual risks are listed in **Table 1.2**. Occurrence rate is based on an analysis of the Risk Documentation and calculated based on Post Market Surveillance data from September 1, 2019 through August 31, 2024. There are no unknown residual risks for the FemoSeal™ VCS and all applicable risks have been addressed through the Instructions for Use and risk management process.

Table 1.2. FemoSeal Adverse Events/Complications

| Harm                                 | Occurrence Rate (%) | Mitigating Factors                                                                                                                                                      |

### 1.3.2 Warnings and Precautions

#### Warnings

1. Do not use if the package has been damaged or any sterile barrier is not intact.
2. Do not use after expiry date – the biodegradable components may not perform adequately.
3. Do not use if any items appear damaged or defective in anyway.
4. Use of FemoSeal™ Vascular Closure System where bacterial contamination of the procedural sheath or the surrounding tissue may have occurred, may cause infection.
5. If it is suspected that the posterior arterial wall has been punctured or more than one arterial puncture has been made, do not rely solely on FemoSeal™ Vascular Closure System to achieve arterial hemostasis. Use additional manual or mechanical compression.
6. If the puncture site is at, or distal to the bifurcation of the femoral artery, FemoSeal™ Vascular Closure System should not be used due to the risk of the Inner Seal being positioned incorrectly. This event may result in bleeding complications and/or disruption to normal blood flow.
7. If there is persistent arterial bleeding from the incision site, do not cut the multifilament until hemostasis is achieved. If hemostasis is not achieved, fasten the multifilament with a sterile wound dressing and apply supplementary compression until hemostasis is achieved. In the case of persistent arterial bleeding, significant bleeding complications may occur which could result in patient injury or death.
8. Do not use the FemoSeal™ Vascular Closure System if the puncture site is proximal to the inguinal ligament as this may result in a retroperitoneal hematoma.
9. Patients at a higher risk for bleeding may suffer increased blood loss, requiring a transfusion.
10. If the inner disc becomes detached it can potentially cause a thrombotic and/or embolic event.

#### Precautions

1. FemoSeal™ Vascular Closure System deployment procedure should be performed by physicians with adequate training in the use of the device.
2. Perform a limited femoral angiogram or an ultrasound-guided femoral puncture prior to FemoSeal™ Vascular Closure System deployment.
3. Discontinue procedure if:
  - Lumen diameter of common femoral artery < 5 mm.

- Stenosis and/or significant plaque present in the vicinity of the common femoral arterial puncture site.
  - Arterial puncture is at, or distal to, the femoral artery bifurcation.
  - Anomalous branches or vessel abnormalities present in the vicinity of the common femoral arterial puncture site.
4. If any hematoma is present, extra care must be taken for correct insertion of the cone housing sheath into the artery.
  5. Use a single wall puncture technique. Do not puncture the posterior wall of the artery.
  6. Observe sterile technique at all times when using FemoSeal™ Vascular Closure System.
  7. FemoSeal™ Vascular Closure System is for single use only and should not be resterilized or reused in any manner. The FemoSeal™ unit is designed in such a manner, that it cannot be re-used.
  8. If deployment of the Inner Seal meets unexpected resistance, discontinue the procedure.
  9. For correct deployment of Inner Seal, reposition your thumb so that the button can spring back freely.
  10. Ensure the tip of the cone housing sheath of FemoSeal™ Unit is under the skin surface before deployment of the Outer Locking Disc. The Outer Locking Disc may inadvertently be deployed above skin level in patients with a short distance between the femoral artery and the skin level.
  11. For correct deployment, a skin incision may be necessary before deployment.
  12. If the Inner Seal is inside the artery, but it is not possible to fully depress the button and deploy the Outer Locking Disc, surgery may be required to remove FemoSeal™ Closure Elements.
  13. If repuncture of the same femoral artery becomes necessary within 18 months, repuncture should be made at least one centimeter proximal to the previous FemoSeal™ Vascular Closure System access site.
  14. Instruct the patient to follow physician's orders regarding closure site inspection.
  15. Instruct the patient to carry the Patient Information Card for the next 18 months

### **Precautions at time of discharge**

Before considering discharge, assess the patient for the following clinical conditions:

1. Bleeding and/or hematoma at the closure site.
2. Pain while walking.

- Signs of infection at the closure site.

### 1.3.3 Field Safety Corrective Actions

There was one Field Safety Corrective Action involving FemoSeal™ VCS during the period from 01 September 2019 through 31 August 2024.

In 2022, Terumo voluntarily recalled FemoSeal™ VCS due to complaints alleging the failures in process and lot release testing of Elkton manufactured FemoSeal product for Tamping Force Measurement and Retraction Force. A total of 950 units were recalled from South Korea.

## 1.4 Clinical Evaluation and Post-Market Clinical Follow-Up

**Table 1.3** includes a list of pivotal studies included to bring FemoSeal™ VCS to market as well as post-market studies and post-market clinical follow up activities. Device version utilized in the study is included in the table below. The first version of FemoSeal™ VCS (#11200) was on the market until 2006, while the next version (#C11202) was released to the market in 2006 and is what is currently in the marketplace today.

**Table 1.3 Summary of Pivotal Studies**

| Pre-Market Functional Animal Testing                                                                                                                                                                                                                                    | Device Version             |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vasculature System. Functional Implantation Test in Sheep 12-, 15-, and 18-month Time Periods. (R1051-1), 2000, Radi Medical System AB (performed by Biomatech, France). | 11200                      |

| <p>the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>Performed by Biomatech, France</p> | <p>tested device was intended to enter the puncture hole in arteries to achieve haemostasis. One disc entered the puncture hole in the artery and the other tightened the internal disc from outside the artery. Both discs were inserted through an introducer sheath. The discs were designed to prevent bleeding, to heal into the vessel wall and finally degrade and be absorbed. The study was designed to collect and analyze data after functional implantation in the sheep and pig to evaluate the capacity of the implant to maintain physiologic function when used in the circulatory system, to determine the response of the host and the response of the device (physical integrity, tissular encapsulation at sacrifice) and to evaluate the degradation of the implant</p> | <p>8 closure elements implanted in 2 sheep,<br/><br/>2 closure elements implanted in 1 pig<br/><br/>When two closure elements were implanted into same femoral artery, they were implanted at a distance &gt; 30 mm</p> | <p>of the device, with a special emphasis on the internal disc encapsulation.<br/><br/>Macroscopically, no significant signs of local intolerance or thrombus formation were observed. The macroscopic observation did not reveal any difference between the sheep or the pig after implantation of the closure elements in the femoral arteries. Macroscopically, no significant signs of local intolerance or thrombus formation were observed. The macroscopic observation did not reveal any difference between the sheep or the pig after implantation of the closure elements in the femoral arteries.<br/><br/>The histopatological analysis of the implantation site in sheep showed no local adverse reactions. The inner and outer discs showed signs of degradation and were in some cases broken into smaller parts. The inner discs were completely integrated into neointimal tissue. In the pig the histopatological analysis showed slightly more inflammatory signs around the inner and outer discs. In both animals, the multifilament exhibited slightly more inflammatory signs than in the disc material, which is normal for braided sutures</p> |

As part of the premarket development plan for FemoSeal™ VCS, 3 animal functional tests were completed. In 2000, prior to initiating clinical studies, an animal study was performed to evaluate the bio-functionality of FemoSeal™ VCS. This study evaluated the capacity of the closure elements to maintain physiologic function and to evaluate their degradation. At 18 months the inner and outer disc material was no longer visible, having been replaced with an endoluminal fibrous tissue. In conclusion, the capacity of the FemoSeal™ VCS closure element to maintain physiologic function when used in the circulatory system was confirmed.

In 2002 an animal study was performed to evaluate the biocompatibility and biofunctionality of a biodegradable implant, FemoSeal™ VCS, designed to achieve hemostasis in the vascular

system. In summary, the degradation of the implant was nearly complete by 36 weeks and there was no significant adverse tissular reaction.

Another animal study in 2002 evaluated the biocompatibility and biofunctionality of a biodegradable implant, FemoSeal™ VCS, designed to achieve hemostasis in the vascular system. After 5 weeks, encapsulation of the disc was complete, and signs of degradation were observed for internal and external discs. In conclusion, the capacity of the implant to maintain physiologic function when used in the circulatory system was confirmed.

As part of the clinical development plan for FemoSeal™ VCS, Radi Medical System AB conducted a pre-market clinical investigation. This clinical investigation is not published or available online. The study with device model #11200 was conducted in 2002-2004 under European Standard EN 540 (Clinical Investigation of Medical Devices for Human Subjects) and in accordance with the ICH General Considerations for Clinical Trials and Guideline for Good Clinical Practice. The details of this study are documented in report EU-SE-001. The clinical trial was documented in the Final Report from Radi Medical Systems AB, “Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures”. The clinical study was performed with FemoSeal™’s first model #11200 and focused on the safety and effectiveness of the implantable closure components. The only difference between the first model #11200 and the current model, C11202, is the French size, 6F and 7F respectively, and the improved delivery system. The clinical benefits, intended use, principles of operation, and the raw materials of the implantable closure elements, inner seal and outer locking disc, remain unchanged.

The intended use of the device was for patients undergoing diagnostic cardiac or interventional cardiac procedures using the femoral artery as an access point. The objective of this study was to determine the safety, performance, and effectiveness of the FemoSeal™ VCS. This was a prospective, multi-center, single arm open-label study with 30-day follow-up.

The primary performance endpoint was time to hemostasis defined as the absence of brisk bleeding. The primary safety endpoint was incidence of major vascular complications through 30-days. Secondary endpoints included time to ambulation, proportion of treatment failures, incidence of adverse events, and device performance characteristics during delivery and deployment.

Patients included in this study were adults able to provide informed consent and with at least one intact pedal pulse. Patients were excluded from the study if they had any of the following conditions:

- History of peripheral vascular disease
- Autoimmune disease
- Known bleeding disorder or severe anemia

- INR >1.5
- Myocardial infarct with 72 hours
- Uncontrolled hypertension despite treatment
- Obesity precluding access with Seldinger technique
- Presence of vascular graft or stent at arteriotomy site
- Previous ipsilateral puncture within 3 months
- Life expectancy < 6 months

Additionally, patients were examined intraoperatively and excluded from the study if any of the following were observed:

- Lumen diameter of common femoral artery <5mm
- Arterial branches within 2 cm proximal to puncture site
- Significant stenosis within 3 cm of puncture site
- Use of primary introducer sheath >6Fr
- Puncture at or distal to femoral bifurcation
- Multiple femoral punctures
- Known or suspected posterior femoral wall puncture
- Large hematoma (2:6 cm) at completion of the procedure
- Difficult primary sheath insertion for procedure due to tortuous tissue or vessel

This single protocol study was conducted in two parts: 20 patients were enrolled during Part 1, then a safety analysis was completed, and then an additional 60 patients were enrolled during Part 2.

In Part 1, mean age of enrolled patients was 65.9 years, 70.0% of patients were male, and 95% of patients were on concomitant medications. In Part 2 of the study, mean age was 63.8 years, 78% were male, and 100% were on concomitant medications.

Patients undergoing diagnostic (Part 1 and Part 2) or interventional (Part 2) cardiac catheterization procedures were eligible for enrollment in the study. The procedures were compliant with standard of care at each of the enrolling hospitals, followed by use of the FemoSeal™ VCS. Patient data was collected at baseline, during the procedure, and at 1-day and 30-days post-procedure. Results are summarized in **Table 1.5** and indicate FemoSeal™ VCS is safe and effective for use in this patient population.

**Table 1.5 Clinical Results Reported in Pre-Market Study**

|                                                                                                   | Part 1       | Part 2                    |
|---------------------------------------------------------------------------------------------------|--------------|---------------------------|
| Number of patients                                                                                | 20           | 60                        |
| Mean Time to Hemostasis                                                                           | 1.2 minutes  | 1.6 minutes <sup>a</sup>  |
| Mean Time to Ambulation                                                                           | 72.2 minutes | 87.5 minutes <sup>b</sup> |
| Incidence of Major Vascular Complications <sup>c</sup>                                            | 0 (0%)       | 1 (2%)                    |
| Number of Patients with Adverse Events                                                            | 5 (25%)      | 19 (32%)                  |
| Treatment failure (defined as major vascular complications, need for manual compression, or both) | 0 (0%)       | 3 (5%)                    |
| Device Malfunctions                                                                               | 0 (0%)       | 6 (10%)                   |

<sup>a</sup>Based on total sample size of 58 because 2 patients did not reach hemostasis at time of procedure due to previous ipsilateral punctures. Hemostasis was achieved at 7 minutes and 37 minutes for these patients.

<sup>b</sup>Based on total sample size of 59: 1 patient was not included because they were placed on ventilator due to pulmonary edema and unable to ambulate for over a week.

<sup>c</sup>Defined as vascular complication requiring blood transfusion or surgical repair, or local infection requiring administration of antibiotic, hospitalization or extension of hospitalization, or site debridement

No major vascular complications were observed in Part 1 of the study. There was 1 major vascular complication reported in Part 2 of the study: pseudoaneurysm that was reported within 1 day post-procedure. The event required ultrasound guided compression and an injection of thrombin into the pseudoaneurysm, and extended the patient's hospitalization.

Of the 5 adverse events reported in Part 1 of the study, there was 1 possibly device-related adverse event: a non-serious event of brisk bleeding at 1-day post procedure. Of the 19 adverse events reported in Part 2 of the study, 3 device-related non-serious adverse events of hematoma were observed, and 6 possibly device-related non-serious events were observed including 3 reports of persistent oozing, 2 hematomas, and 1 leg pain after exercise.

There were 3 patients in Part 2 considered treatment failures: 2 due to failure to achieve hemostasis without the use of compression and 1 due to the major vascular complication (pseudoaneurysm). There were no treatment failures in Part 1 of the study.

Of the six device malfunctions in Part 2 of the study, three did not interfere with the procedure, one was attributed to user error, one was leakage of the introducer, and one was a broken filament joint. The last two issues were addressed with model updates implemented in C11202.

Part 2 of the pre-market clinical study did not report the 6-month follow-up results due to patient non-compliance. The pre-market clinical study (EU-SE-001) 30-day results, which is in line with the clinical literature's follow-up time period, demonstrates that FemoSeal™ VCS is safe and effective.

## 1.4.2 Summary of Data from Post-Market Clinical Studies

There were 4 completed post-market clinical studies described in **Table 1.6** below. These clinical investigations are not published or available online.

**Table 1.6 Post-Market Clinical Studies**

| Completed Post-Market Clinical Studies                                                      |                                                           |                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                  |    |     |          |       |          |           |    |           |           |                         |          |                    |            |                     |           |                   |         |                       |          |                                |          |                      |           |                          |           |                                   |          |                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|--|--|--|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The 2006 study was conducted to confirm the safety and effectiveness of the current device with an improved delivery system and to get feedback on the FemoSeal™ VCS IFU and training program. The study included 100 patients and the primary endpoint was whether hemostasis was achieved, or if additional manual or mechanical compressions was needed. This study concluded that the application of FemoSeal™ VCS was successful in the majority of cases (91% achieved immediate hemostasis).

The 2008 study enrolled 50 patients to assess the safety and performance of FemoSeal™ VCS when used during normal clinical routine in patients undergoing cardiac catheterization with a 7 Fr sheath. The primary endpoint for the study was to collect data on the time to hemostasis and the time to ambulation without additional compression, manual or mechanical. The study results concluded that the mean time to hemostasis was 57.8 seconds and all patients ambulated after 4 hours of bed rest.

The 2009 study was to evaluate the new FemoSeal™ VCS packaging. 25 patients were enrolled in the study. The primary endpoint was whether the user experienced any problems with the packaging. The users noted no problems regarding the new FemoSeal™ VCS packaging. This study also collected data for the time to hemostasis.

The 2022 study was to proactively collect safety and effectiveness data of FemoSeal VCS in achieving hemostasis of common femoral artery (CFA) access site in real-world subjects undergoing percutaneous endovascular procedures. 230 patients were enrolled in the study. The primary endpoints for the registry are procedural success (i.e., successful puncture site hemostasis) and reduction in major complications (e.g., vascular injury, access site-related bleeding, access site infection, repeat manual compression, and new access site-related ipsilateral acute leg ischemia). The study concluded that the FemoSeal™ VCS performs well in real-world settings and provides effective haemostasis and low rates of access-site complications for patients undergoing peripheral endovascular interventions. It demonstrates a good performance with short time to haemostasis and good operator usability feedback, which makes FemoSeal™ VCS a valuable device for femoral access closure.

### 1.4.3 Summary of Data from Post-Market Clinical Follow-Up

#### 1.4.3.1 Completed Post-Market Clinical Follow-Up

A summary of the completed post-market clinical follow-up activities is described in **Table 1.7** below.

**Table 1.7. Post-Market Clinical Follow-Up Activities**

| Completed Post-Market Clinical Follow-Up Activities |         |            |            |            |                               |

Terumo Medical Corporation has completed three high-quality physician user surveys during the current reporting period (01 September 2019-31 August 2024).

The FemoSeal™ Clinical Surveys collected proactive clinical data in relation to the safety and performance of the FemoSeal™ VCS during clinical use. The survey included questions focused on the overall device and associated accessories including the 0.038” guidewire, and their direct interactions. The Guidewire clinical surveys collected proactive clinical data in relation to safety and performance during clinical use of the 0.038” guidewire supplied with FemoSeal™ VCS. The survey questions focused specifically on the general use of the guidewire ranging from insertion through the procedural sheath into the vasculature through removal of the wire.

The FemoSeal™ VCS and 0.038” guidewire included with the device received all acceptable ratings and six (6) complaints were filed for the device and nine (9) non-complaints for the guidewire based on evaluation of the comments received from the high-quality clinical surveys. The complaints have been evaluated for both the FemoSeal and the guidewire and were assessed as part of Terumo post-market surveillance process. There were no new risks and or risk levels identified.

A physician user survey was completed in 2024 as part of PMCF activities. The results of the survey demonstrated that the FemoSeal™ VCS performance rating and safety were overall very favorable. The compatibility of other guidewires than the one standard provided with the FemoSeal™ VCS was also demonstrated.

**1.4.3.2 Ongoing/Planned Post-Market Clinical Follow-Up**

TMC has one ongoing/planned post-market clinical follow-up activities. A clinical survey will be completed to prospectively collect feedback related to the use of the guidewire with FemoSeal VCS distributed in the EU market. The survey will be completed by physicians to study which guidewires they used during the procedure. The purpose of this survey is to address a gap identified as the lack of literature and external reviewer commentary on the FemoSeal™ VCS compatibility with the use of other guidewires from non-Terumo brands. The feedback includes technical outcomes, clinical performance, and safety pertaining to the performance of the device with different guidewires.

**1.4.4 Summary of Data from Systematic Literature Review**

Terumo Medical Corporation conducts systematic literature reviews to collect and evaluate clinical safety and performance data from published studies on the FemoSeal™ VCS and/or

similar devices. The aim of the annual screening of the published literature is to identify previously unknown side-effects, monitor known side effects, identify emergent risks, and identify possible systematic misuse or off-label use of the FemoSeal™ VCS.

The most recent systematic literature review, which covered the period from September 1, 2019 through August 31, 2024, identified 29 published studies that provided clinical safety and performance data on the FemoSeal™ VCS. Twenty-three references reported on-label usage of FemoSeal™ VCS and off-label usage was reported in nine studies. Overall, the literature review of studies specific to the use of FemoSeal™ VCS shows a population under study that is representative of patients in the EU undergoing percutaneous vascular catheterization procedures. See **Section 3** for a list of these 23 on-label peer-reviewed publications.

Clinical performance was assessed by the following measures:

- Time to hemostasis is better than or comparable to the State of the Art for percutaneous common femoral artery closure.
- Time to ambulation is better than or comparable to the State of the Art for percutaneous closure of the common femoral artery.
- Rate of post-operative complications are comparable or lower than the current standards of care.

Based on these clinical performance measures, the data in this literature review showed that FemoSeal™ VCS can be used successfully in closing the femoral arterial puncture (arteriotomy) in patients who have undergone percutaneous catheterization using a 7 Fr or smaller procedural sheath. Complete hemostasis was achieved in a majority of patients (79.65-100%) of the cases and was associated with a median time to hemostasis of 0.5min, mean time to discharge of 3 days. Between 69.2-86.7% of patients were able to ambulate 5 hr after closure, with a mean post-operative bedrest of 349 min. FemoSeal™ VCS failure was observed in 3.68-4% of cases, and additional manual compression was needed in 0.9-4.4% of procedures.

Clinical safety was assessed by adverse events including, but not limited to:

- Bleeding
- Hematoma
- Pseudoaneurysm
- Bruise
- Arteriovenous Fistula
- Infection
- Death

For each of these adverse events, the rate of occurrence reported for FemoSeal™ VCS in the included studies was less than or comparable to historically reported rates for manual compression and other vascular closure devices.

No adverse events were identified through review of 10 case reports, as no new, unanticipated, emerging, or unacceptable risks were identified.

The overall effectiveness of using FemoSeal™ VCS during diagnostic angiography or interventional operations depends on multiple factors such as: gender, age, patient anatomy, comorbidities, anatomical placement of the puncture site, surgeon's experience, VCD deployment method, postoperative care, etc. In addition to technical success including achievement of hemostasis, FemoSeal™ VCS offered clinical benefits relative to vascular closure after femoral arterial puncture such as reduction in time to hemostasis, reduction in time to ambulation. The performance outcomes for the FemoSeal™ VCS are consistent with those expected for this type of device when used as intended. Some of the references retrieved during the current search period showed the use of the subject device in an anatomical location other than the common femoral artery and for closure of arteriotomies > 7 Fr, which is considered off-label.

No unknown side-effects, emergent risks, or possible systematic misuse of the device were identified during review. However, if the FemoSeal™ VCS is used with care by trained physicians the medical device performs as a useful and necessary clinical device. Overall, the target therapy and therefore the FemoSeal™ VCS address the clinical need that currently exists in treatment of vascular access related complications.

Overall, the data in this literature review did not identify any performance or safety issues in the clinical setting that were previously unknown, or adverse effects that occurred at higher than anticipated / acceptable rates. Therefore, it can be concluded from this literature review that FemoSeal™ VCS, when used to provide compression for hemostasis at the arteriotomy following percutaneous catheterization, continues to perform as expected and is not associated with serious safety events.

#### **1.4.5 Summary of Data from Post-Market Surveillance**

A proactive PMS system is in place and a review of all complaints is completed on a monthly basis and in compliance with internal manufacturing procedures. Complaint data was analyzed during the time period of September 1, 2019 to August 31, 2024. Overall, there were 28 Medical Device Vigilance (MDV) Reports and 476 customer complaint reports submitted to the manufacturer. Of the 28 MDV reports, 27 were related to adverse events and one to device malfunction. There were two deaths during the reporting period, but none of the reported deaths were adjudicated to be related to the subject device. Among the 476 complaints made to the manufacturer, the most common reasons for complaints was deployment difficulties (146 occurrences, 0.0142% occurrence rate). Failure mode of pullout events is the second most occurring with a rate of 0.0126% (130 events).

FemoSeal™ Vascular Closure System has over 1,030,136 sales globally and 827,843 in the European Economic Area. The calculated frequency of complaints based on global sales is 0.046%. The overall customer complaint rate is very low. No new risks were identified that are not included in the IFU and risk documentation.

The occurrence rates for the undesirable side effects are shown in **Table 1.2**. No new unanticipated, emerging, or unacceptable risks were identified through the complaints. There were no significant increases in the frequency or severity of known undesirable side effects.

#### **1.4.6 Overall Summary of Clinical Performance and Safety**

FemoSeal™ VCS is indicated for use in closing the common femoral arterial puncture (arteriotomy) in patients who have undergone percutaneous catheterization using a 7F (2.33 mm) or smaller procedural sheath. This clinical evaluation is based on a comprehensive analysis of available pre- and post-market clinical data and literature relevant to the intended use of the FemoSeal™ VCS.

A comprehensive review of the published literature was conducted covering the period from September 1, 2019, through August 31, 2024. The body of evidence included 29 studies for the FemoSeal™ VCS. The evidence provided in the clinical evaluation concludes that when used as indicated, the subject device is safe and effective and any risks or undesirable side effects, which may be associated with the device under normal conditions of use, constitute acceptable risks when weighed against the benefits to the patient. The performance outcomes for the subject devices are consistent with those expected for this type of device when used as intended.

The potential undesirable side-effects associated with the use of FemoSeal™ VCS include the adverse events commonly reported with alternative means of arteriotomy closure, e.g., bleeding and hematoma. Overall, the occurrence rates for the adverse events reported with the use of FemoSeal™ VCS are similar to the rates reported with manual compression and similar vascular closure devices. Specifically, for bleeding and hematoma, the reported rates for FemoSeal™ VCS are less than the reported rates for similar vascular closure devices. Each of the reported adverse events, from both the published literature and post-market surveillance, had been previously identified (see **Section 1.3**).

The existing data regarding the clinical safety and performance of suggest that patient benefits from use of this vascular closure device outweigh possible risks when it is used in accordance with the Instruction for Use.

As indicated in the previous sections above, the data provided for FemoSeal™ VCS demonstrates the consistency between the data related to the device under evaluation (e.g., device usage, safety outcomes, clinical performance, and clinical benefits), identified equivalent devices and the data related to similar devices listed in the State of the Art.

The cross-analysis of safety data did not identify any gaps between the following:

- Data mentioned in the State of the Art
- Data specific to the device under evaluation
- Data mentioned in the Risk Management File(s)
- Data mentioned in the labelling and/or IFU (i.e., residual risks to be conveyed to the user are addressed).

Clinical safety has been demonstrated by low rates of complications identified in the published per-reviewed clinical literature, company sponsored clinical studies, review of the post-market data coupled with no market withdrawals. No concerns with performance have been identified, the literature reviewed contained use of FemoSeal™ VCS that was consistent with the manufacturer's intended use.

### **1.5 Possible Diagnostic or Therapeutic Alternatives**

Manual compression is traditionally used to achieve hemostasis at the arteriotomy site after vascular catheterizations. Manual compression has been associated with the patient being immobilized for long periods of time (up to 8 hours after a procedure) and with substantial discomfort and extended hospital stays. A recent systematic review found that the median time to achieve hemostasis with manual compression was 20.8 minutes.<sup>1</sup>

Alternatives to manual compression include external hemostatic devices that apply mechanical compression to the arteriotomy site. These devices do not shorten the time to hemostasis or time to ambulation but reduce the personnel requirements by replacing manual compression with mechanical compression. Adverse event rates associated with the use of mechanical compression are similar to rates with manual compression.

Vascular closure devices, such as FemoSeal™ VCS, are designed to close the arteriotomy. They aim to reduce the time to hemostasis and enable earlier ambulation. A recent systematic review, including 13 commercially available devices, found that the median time to achieve hemostasis with a vascular closure device was 5.4 minutes. The median hemostasis time for the individual vascular closure devices ranged from 1 minute (FemoSeal™ VCS) to 14 minutes; with the majority of devices being between 4 and 10 minutes.<sup>1</sup>

Commonly reported adverse events associated with closure of the arteriotomy site, with manual compressions, external hemostatic devices, or vascular closure devices, include hematoma, bleeding at the access site, pseudoaneurysm, arteriovenous fistula, and infection. The same systematic review (34 randomized controlled trials, 14,401 patients) found that the rates of adverse events were similar between manual compression and the use of vascular closure devices, with the exception that bleeding tended to be a little higher with vascular closure devices.<sup>1</sup>

## 1.6 Suggested User Profile and Training

FemoSeal™ Vascular Closure System’s intended users are physicians with training qualifying them to perform arterial access and closure for endovascular procedures through the common femoral artery and have participated in a Terumo Medical Corporation FemoSeal™ physician instruction program.

## 1.7 Relevant Harmonized and Common Standards

Настоящото обобщение на безопасността и клиничната ефикасност (SSCP) е предназначено да предостави публичен достъп до актуализирано обобщение на основните аспекти на безопасността и клиничното действие на FemoSeal™ Vascular Closure System (VCS).

Обобщение на безопасността и клиничната ефикасност на изделието, предназначено за потребители / медицински специалисти, е предоставено в **раздел 1.0**.

## **1.0 ОБОБЩЕНИЕ ЗА ПОТРЕБИТЕЛИ/МЕДИЦИНСКИ СПЕЦИАЛИСТИ**

SSCP не е предназначено да замени инструкциите за употреба като основен документ, за да се гарантира безопасната употреба на изделието, нито е предназначено да предоставя диагностични или терапевтични предложения на предвидените потребители или пациенти. SSCP не е предназначено да замени задължителната информация на картите за импланти или в други задължителни документи.

### **1.1 Предназначение на изделието**

#### **1.1.1 Предназначение**

FemoSeal™ Vascular Closure System е медицинско изделие, предназначено за затваряне на артериална пункция след перкутанна катетеризация през общата феморална артерия.

#### **1.1.2 Показания за употреба**

FemoSeal™ Vascular Closure System е предназначена за затваряне на пункция на общата феморална артерия (артериотомия) при пациенти, които са били подложени на перкутанна катетеризация с помощта на 7F (2,33 mm) или по-малък процедурен катетър.

#### **1.1.3 Противопоказания и/или ограничения**

FemoSeal™ Vascular Closure System е противопоказана при пациенти с артериотомия, при която са използвани катетри или изделия с размер по-голям от 7F (2,33 mm).

#### **1.1.4 Целеви популации пациенти**

Безопасността и ефективността на FemoSeal™ Vascular Closure System са установени при пациенти на възраст над 18 години, които са били подложени на перкутанна катетеризация с помощта на 7F (2,33 mm) или по-малък процедурен катетър.

#### **1.1.5 Специални популации пациенти**

Безопасността и ефективността на FemoSeal™ Vascular Closure System не са установени в следните популации пациенти:

- Пациенти с предварително съществуващо автоимунно заболяване.
- Пациенти, подложени на терапевтична тромболиза.
- Пациенти с клинично значимо периферно съдово заболяване.
- Пациенти с неконтролирана хипертония (> 220 mmHg систолно или > 110 mmHg диастолно).

- Пациенти с нарушение на кръвосъсирването, включително тромбоцитопения ( $< 100\,000$  брой на тромбоцити) или анемия ( $Hgb < 10\text{ mg/dl}$ ).
- Пациенти с вътрешен лумен на общата феморална артерия по-малък от 5 mm.
- Пациенти с бъбречно и/или чернодробно увреждане.
- Пациенти с други свързани съпътстващи заболявания.
- Пациенти със специфичен расов и/или етнически произход.
- Пациенти, прекарвали миокарден инфаркт през последните 72 часа.
- Пациенти със съдов графт или стент на мястото на пункцията.
- Пациентки, които са бременни или кърмят.
- Пациенти на възраст под 18 години.

#### 1.1.6 Целеви потребители

Целевите потребители на FemoSeal™ Vascular Closure System са лекари с обучение, което ги квалифицира да извършват артериален достъп и затваряне след ендоваскуларни процедури през общата феморална артерия и които са участвали в програма за обучение на лекари на Terumo Medical Corporation за FemoSeal™.

### 1.2 Описание на изделието

#### 1.2.1 Описание на изделието

FemoSeal™ Vascular Closure System, произведена от Terumo Medical Corporation (TMC), е резорбируемо устройство за затваряне на съдове, предназначено за постигане на хемостаза на феморалната артерия след перкутанна катетеризация през общата феморална артерия.

Затварящите елементи на FemoSeal™ представляват два резорбируеми полимерни диска, вътрешно уплътнение и външен заключващ диск, които са прикрепени един към друг чрез резорбируем мултифиламент, като по този начин механично запечатват артериотомията (вижте **Фигура 1.1** и **Фигура 1.2**). След като бъде поставен през конуса, съдържащ катетър, външният заключващ диск се притиска върху мултифиламентния сноп, което води до механично затваряне на мястото на пункцията между вътрешния и външния заключващ диск. Вътрешното уплътнение и външният заключващ диск се придържат чрез триене върху мултифиламентния сноп. Хемостаза се постига по механичен път. Затварящите елементи се разграждат чрез хидролиза.

Имплантируемите компоненти за затваряне, вътрешното уплътнение и външният заключващ диск се разграждат за осемнадесет (18) месеца, докато мултифиламентът се счита за разграден и абсорбиран чрез хидролиза от околната тъкан след две (2) до три (3) години. Способността на имплантируемите компоненти за затваряне на съдове да поддържат компресията върху артериотомията е тествана до осем (8) часа. Продуктите на разграждане се метаболизират и екскретират в урината или се извеждат като въглероден диоксид през белите дробове. При проучвания върху животни не са наблюдавани ефекти на натрупване. Допълнителните компоненти на FemoSeal™, които ще влязат в контакт с жива тъкан или кръв по време на процедурата, са конусът, съдържащ катетър, дилататорът, работната тръба, тласкачът и водачът.

**Фигура 1.1 Вътрешно уплътнение и външен заключващ диск, съответно**

**Фигура 1.2 Вътрешно уплътнение и външен заключващ диск, поставени**

Изделието FemoSeal™ е опаковано заедно с дилататор и водач с 0,038" (0,97 mm) OD, 27,5" (70 cm) дължина и J-изправител, вижте **Фигура 1.3** по-долу. Водачът се намира в полиетиленова тръба. Всички части са опаковани във фиксирана хартиена тава. Опаковката включва и картата на импланта на пациента. FemoSeal™ Vascular Closure System не изисква допълнителни аксесоари, за да може изделието да функционира по предназначение, като изделието е предназначено да се използва само с дилататора и водача, включени в опаковката на продукта.

**Фигура 1.3 FemoSeal™ VCS с водач и дилататор**

## 1.2.2 Суровини и компоненти

**Таблица 1.1** по-долу изброява компонентите на FemoSeal™ VCS.

**Таблица 1.1** Суровини и компоненти на FemoSeal™ VCS

\* Имплантируема част на изделието; имплантируемите компоненти са безопасни за ЯМР

FemoSeal™ VCS е стерилизирана с етиленов оксид (EO) и е медицинско изделие за еднократна употреба. Изделието FemoSeal™ VCS е проектирано по такъв начин, че да не може да се използва повторно.

### **Начин на действие**

FemoSeal™ VCS насърчава механичната хемостаза чрез разполагане на имплантируеми затварящи елементи от вътрешната и външната страна на феморалната артерия. Механизмът, който предотвратява кървенето, се осигурява от вътрешното уплътнение, което затваря мястото на пункцията, и външния заключващ диск, който държи вътрешното уплътнение фиксирано.

### **1.2.3 Клинична полза**

FemoSeal™ VCS осигурява следните клинични ползи по отношение на съдовото затваряне след пункция на общата феморална артерия:

- Намаляване на времето до хемостаза<sup>1</sup>

- Намаляване на времето до раздвижване<sup>1</sup>

#### 1.2.4 Предходно(и) поколение(я) или варианти

- Първата версия на FemoSeal™ VCS (№11200) се продаваше на европейския пазар през 2005 г. и част от 2006 г.
- Настоящата FemoSeal™ VCS (№11202), с подобрена система за доставяне, е на пазара от 28 март 2006 г.

#### 1.2.5 Аксесоари, предназначени за използване в комбинация с устройството

Системата FemoSeal™ е опакована заедно с дилататор и водач с 0,038” (0,97 mm) OD 27,5” (70 cm) дължина и J-изправител. Водачът е аксесоар за системата FemoSeal™. J-изправителят е компонент на водача, докато дилататорът е компонент на системата FemoSeal™. Водачът е единственият специален аксесоар. Водачът се намира в полиетиленова тръба. Всички части са опаковани във фиксирана хартиена тава. Опаковката включва и картата на импланта на пациента. FemoSeal™ Vascular Closure System не изисква допълнителни аксесоари, за да може изделието да функционира по предназначение, като изделието е предназначено да се използва само с дилататора и водача, включени в опаковката на продукта.

#### 1.2.6 Други изделия и продукти, предназначени за използване в комбинация с изделието

FemoSeal™ VCS не изисква допълнителни изделия, за да функционира по предназначение.

### 1.3 Рискове и предупреждения

#### 1.3.1 Остатъчни рискове и нежелани ефекти

Известни или предвидими нежелани събития, вреди и усложнения, свързани с употребата на устройството FemoSeal™ VCS в резултат на остатъчни рискове, са изброени в **Таблица 1.2**. Честотата се основава на анализ на документацията за риска и се изчислява въз основа на данни от наблюдение след пускане на пазара от 1 септември 2019 г. до 31 август 2024 г. Няма неизвестни остатъчни рискове за FemoSeal™ VCS и всички приложими рискове са разгледани чрез Инструкциите за употреба и процеса на управление на риска.

**Таблица 1.2. Нежелани събития/усложнения, свързани с FemoSeal**

| Вреди                                   | Честота (%) | Смекчаващи фактори                                                                                                                                                                                            |

### 1.3.2 Предупреждения и предпазни мерки

#### Предупреждения

1. Не използвайте, ако опаковката е повредена или някоя стерилна бариера е нарушена.
2. Не използвайте след изтичане на срока на годност – биоразградимите компоненти може да не работят адекватно.
3. Не използвайте, ако някои елементи изглеждат повредени или дефектни.
4. Използването на FemoSeal™ Vascular Closure System на място, където може да е настъпило бактериално замърсяване на катетъра или на околната тъкан, може да причини инфекция.
5. Ако има съмнения, че задната артериална стена е пробита или е направена повече от една артериална пункция, не разчитайте единствено на FemoSeal™ Vascular Closure System за постигане на артериална хемостаза. Използвайте допълнителна ръчна или механична компресия.
6. Ако мястото на пункцията е върху или дистално от бифуркацията на феморалната артерия, FemoSeal™ Vascular Closure System не трябва да се използва поради риска от неправилно позициониране на вътрешното уплътнение. Това събитие може да доведе до усложнения, свързани с кръвоизлив и/или нарушаване на нормалния кръвен поток.
7. Ако има персистиращо артериално кървене от мястото на разреза, не режете мултифиламента, докато не се постигне хемостаза. Ако не се постигне хемостаза, затегнете мултифиламента със стерилна превръзка и приложете допълнителна компресия, докато се постигне хемостаза. В случай на персистиращ артериален кръвоизлив може да настъпят значителни усложнения, свързани с кръвоизлива, които могат да доведат до нараняване или смърт на пациента.
8. Не използвайте FemoSeal™ Vascular Closure System, ако мястото на пункцията е проксимално на ингвиналния лигамент, тъй като това може да доведе до ретроперитонеален хематом.
9. Пациентите с по-висок риск от кръвоизлив може да претърпят повишена загуба на кръв, изискваща кръвопреливане.
10. Ако вътрешният диск се откачи, това може потенциално да причини тромботично и/или емболично събитие.

## Предпазни мерки

1. Процедурата по поставяне на FemoSeal™ Vascular Closure System трябва да се извършва от лекари с подходящо обучение за използване на изделието.
2. Направете ограничена феморална ангиограма или феморална пункция под ултразвук преди поставянето на FemoSeal™ Vascular Closure System.
3. Прекратете процедурата, ако:
  - Диаметърът на лумена на общата феморална артерия е  $< 5$  mm.
  - Има стеноза и/или значителна плака в близост до мястото на пункцията на общата феморална артерия.
  - Артериалната пункция е върху или дистално от бифуркацията на феморалната артерия.
  - Има аномални разклонения или аномалии на съдове в близост до мястото на пункцията на общата феморална артерия.
4. Ако има някакъв хематом, трябва да се положат допълнителни грижи за правилното поставяне на конуса, съдържащ катетър, в артерията.
5. Използвайте техника за пробиване на една стена. Не пробивайте задната стена на артерията.
6. Спазвайте стерилна техника през цялото време, когато използвате FemoSeal™ Vascular Closure System.
7. FemoSeal™ Vascular Closure System е само за еднократна употреба и не трябва повторно да се стерилизира или да се използва повторно по никакъв начин. Изделието FemoSeal™ е проектирано по такъв начин, че да не може да се използва повторно.
8. Ако при поставянето на вътрешното уплътнение срещнете неочаквано съпротивление, прекратете процедурата.
9. За правилно поставяне на вътрешното уплътнение поставете палеца си така, че бутонът да може да се върне свободно назад.
10. Уверете се, че върхът на конуса, съдържащ катетър, на изделието FemoSeal™ е под повърхността на кожата, преди да поставите външния заключващ диск. Външният заключващ диск може по невнимание да се постави над нивото на кожата при пациенти с малко разстояние между феморалната артерия и нивото на кожата.
11. За правилно поставяне може да е необходим разрез на кожата преди поставянето.

12. Ако вътрешното уплътнение е вътре в артерията, но не е възможно да натиснете докрай бутона и да се постави външния заключващ диск, може да се наложи операция за отстраняване на затварящите елементи на FemoSeal™.
13. Ако се наложи повторната пункция на същата феморална артерия в рамките на 18 месеца, повторната пункция трябва да се извърши най-малко на един сантиметър проксимално от предишното място за достъп на FemoSeal™ Vascular Closure System.
14. Инструктирайте пациента да следва инструкциите на лекаря относно инспекцията на мястото на затваряне.
15. Инструктирайте пациента да носи картата с информация за пациента през следващите 18 месеца

### **Предпазни мерки при изписване**

Преди да обмислите изписване, направете оценка на пациента за следните клинични състояния:

1. Кръвоизлив и/или хематом на мястото на затваряне.
2. Болка при ходене.
3. Признаци на инфекция на мястото на затваряне.

### **1.3.3 Коригиращи действия за безопасност на терен**

Имаше едно коригиращо действие за безопасност на терен, включващо FemoSeal™ VCS, за периода от 01 септември 2019 г. до 31 август 2024г.

През 2022 г. Terumo доброволно изтегли FemoSeal VCS поради оплаквания, в които се твърди за неуспехи в тестването на процеса и освобождаването на партидата на произведения от Elkton продукт FemoSeal за измерване на силата на запресоване и силата на ретракция. Общо 950 единици бяха изтеглени от Южна Корея.

## **1.4 Клинична оценка и клиничното проследяване след пускане на пазара**

**Таблица 1.3** включва списък на основни проучвания, проведени за пускане на FemoSeal™ VCS на пазара, както и постмаркетингови проучвания и постмаркетингови клинични дейности по проследяване. Версията на изделието, използвана в проучването, е включена в таблицата по-долу. Първата версия на FemoSeal™ VCS (№11200) беше на пазара до 2006 г., докато следващата версия (№C11202) беше пусната на пазара през 2006 г. и е това, което в момента се предлага на пазара.

**Таблица 1.3 Резюме на основните проучвания**

| <p>(R1052-01) 2002, Radi Medical System AB (performed by Biomech, France).</p> |  | <p>отвора на пункцията на артерията, за да се постигне хемостаза. Единият диск влиза в отвора на пункцията на артерията, а другият затяга вътрешния диск от външната страна на артерията. И двата диска се поставят през въвеждащ катетър. Дисковете са предназначени да предотвратят кръвоизлив, да зараснат към съдовата стена и накрая да се разградят и да се абсорбират. Проучването беше предназначено да събере и анализира данни след функционална имплантация при овце и прасета, за да оцени способността на импланта да поддържа физиологична функция, когато се използва в кръвоносната система, да се определи реакцията на приемателя и реакцията на изделието (физическа цялост, тъканно капсулиране при умъртвяването) и да се оцени разграждането на импланта</p> | <p>8 затварящи елемента, имплантирани на 2 овце, 2 затварящи елемента, имплантирани на 1 прасе</p> <p>Когато два затварящи елемента се имплантират в една и съща феморална артерия, те се имплантират на разстояние &gt; 30 mm</p> | <p>интеграция на изделието, със специален акцент върху вътрешното капсулиране на диска.</p> <p>Макроскопски не се наблюдават значими признаци на локална непоносимост или образуване на тромби. Макроскопското наблюдение не разкри никаква разлика между овцете и прасето след имплантиране на затварящите елементи във феморалните артерии. Макроскопски не се наблюдават значими признаци на локална непоносимост или образуване на тромби. Макроскопското наблюдение не разкри никаква разлика между овцете и прасето след имплантиране на затварящите елементи във феморалните артерии.</p> <p>При хистопатологичния анализ на мястото на имплантиране при овцете не бяха установени локални нежелани реакции. Вътрешните и външните дискове показваха признаци на разграждане и в някои случаи бяха счупени на по-малки части. Вътрешните дискове бяха напълно интегрирани в неоинтималната тъкан. При прасето хистопатологичният анализ показва малко повече възпалителни признаци около вътрешните и външните</p> |

Като част от предпазарния план за разработване на FemoSeal VCS бяха завършени 3 функционални теста върху животни. През 2000 г., преди започването на клиничните проучвания, беше проведено изследване върху животни за оценка на биофункционалността на FemoSeal™ VCS. Това проучване оцени способността на затварящите елементи да поддържат физиологичната функция и тяхното разграждане. Към 18-я месец материалът на вътрешния и външния диск вече не се виждаше, като беше заменен с ендолуминална фиброзна тъкан. В заключение, беше потвърдена способността

на затварящия елемент FemoSeal™VCS да поддържа физиологичната функция, когато се използва в кръвоносната система.

През 2002 г. беше проведено проучване върху животни за оценка на биосъвместимостта и биофункционалността на биоразградим имплант, FemoSeal™VCS, предназначен за постигане на хемостаза в съдовата система. В резюме, разграждането на импланта беше почти пълно към 36-та седмица и нямаше значима нежелана тъканна реакция.

Друго проучване върху животни през 2002 г. оцени биосъвместимостта и биофункционалността на биоразградим имплант, FemoSea™ VCS, предназначен за постигане на хемостаза в съдовата система. След 5 седмици капсулирането на диска беше завършено и бяха наблюдавани признаци на разграждане за вътрешните и външните дискове. В заключение, беше потвърдена способността на импланта да поддържа физиологичната функция, когато се използва в кръвоносната система.

Като част от плана за клинично разработване на FemoSeal™ VCS, Radi Medical System AB проведе клинично проучване преди пускане на пазара. Това клинично изследване не е публикувано, нито е достъпно онлайн. Изследването с модел на устройството № 11200 беше проведено през 2002-2004 г. съгласно европейски стандарт EN 540 (Клинично изследване на медицински изделия за хора) и в съответствие с общите съображения на ICH за клинични изпитвания и насоките за добра клинична практика. Подробностите за това проучване са документирани в доклад EU-SE-001. Клиничното изпитване е документирано в окончателния доклад на Radi Medical Systems AB, „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures“. Клиничното проучване е проведено с първия модел № 11200 на FemoSeal™ и е фокусирано върху безопасността и ефективността на имплантируемите компоненти за затваряне. Единствената разлика между първия модел № 11200 и настоящия модел, C11202, е френският размер, съответно 6F и 7F, и подобрената система за доставка. Клиничните ползи, предназначението, принципите на работа и суровините на имплантируемите затварящи елементи, вътрешното уплътнение и външния заключващ диск остават непроменени.

Предназначението на изделието е за пациенти, подложени на сърдечни диагностични или интервенционални процедури, използващи феморалната артерия като точка за достъп. Целта на това проучване беше да се определи безопасността, действието и ефективността на FemoSeal™ VCS. Това беше проспективно, многоцентрово, отворено проучване с една група с 30-дневно проследяване.

Първичният очакван резултат за клиничното действие беше времето до хемостаза, определено като липса на обилно кървене. Първичният очакван резултат за безопасността беше честотата на сериозни съдови усложнения в рамките на 30 дни. Вторичните очаквани резултати включваха време до раздвижване, процент на неуспешните

процедури, честота на нежеланите събития и характеристики на работата на изделието по време на доставка и поставяне.

Пациентите, включени в това проучване, бяха възрастни, способни да дадат информирано съгласие и с поне един незасегнат пулс на стъпало. Пациенти с някои от следните състояния бяха изключени от проучването:

- Анамнеза за периферно съдово заболяване
- Автоимунно заболяване
- Известно нарушение на кръвосъсирването или тежка анемия
- INR >1,5
- Инфаркт на миокарда през последните 72 часа
- Неконтролирана хипертония въпреки лечението
- Затлъстяване, което изключва достъп с техниката на Seldinger
- Пациенти със съдов графт или стент на мястото на артериотомия
- Предишна ипсилатерална пункция през последните 3 месеца
- Очаквана продължителност на живота < 6 месеца

Освен това пациентите бяха прегледани интраоперативно и бяха изключени от проучването при установяване на някои от следните:

- Диаметър на лумена на общата феморална артерия < 5 mm
- Артериални разклонения в рамките на 2 cm проксимално от мястото на пункцията
- Значителна стеноза в рамките на 3 cm от мястото на пункцията
- Използване на първичен въвеждащ катетър > 6Fr
- Пункция върху или дистално от бифуркацията на феморалната артерия
- Множество пункции във феморалната артерия
- Известна или подозирана пункция на задната стена на феморалната артерия
- Голям хематом (2:6 cm) при завършване на процедурата
- Трудно поставяне на първичния процедурен катетър поради изкривена тъкан или съд

Това проучване с един протокол се проведе в две части: 20 пациенти бяха включени в част 1, след което беше извършен анализ на безопасността и след това бяха включени допълнителни 60 пациенти по време на част 2.

В част 1 средната възраст на включените пациенти беше 65,9 години, 70,0% от пациентите бяха мъже и 95% от пациентите бяха на съпътстващи лекарства. В част 2 на проучването средната възраст беше 63,8 години, 78% бяха мъже и 100% бяха на съпътстващи лекарства.

Пациенти, подложени на диагностични (част 1 и част 2) или интервенционални (част 2) процедури за сърдечна катетеризация, отговаряха на условията за включване в проучването. Процедурите бяха в съответствие със стандарта за грижи във всяка от участващите болници, последвани от използване на FemoSeal™ VCS. Данните за пациентите бяха събрани на изходно ниво, по време на процедурата и на 1-я и 30-я ден след процедурата. Резултатите са обобщени в **Таблица 1.5** и показват, че FemoSeal™ VCS е безопасна и ефективна за употреба при тази група пациенти.

**Таблица 1.5 Клинични резултати, съобщени в проучването преди пускане на пазара**

|                                                                                                               | Част 1      | Част 2                   |
|---------------------------------------------------------------------------------------------------------------|-------------|--------------------------|

| Средно време до хемостаза                                                                                     | 1,2 минути  | 1,6 минути <sup>a</sup>  |
| Средно време до раздвижване                                                                                   | 72,2 минути | 87,5 минути <sup>b</sup> |
| Честота на сериозни съдови усложнения <sup>c</sup>                                                            | 0 (0%)      | 1 (2%)                   |
| Брой пациенти с нежелани събития                                                                              | 5 (25%)     | 19 (32%)                 |
| Неуспешно лечението (дефинирано като сериозни съдови усложнения, необходимост от ръчна компресия или и двете) | 0 (0%)      | 3 (5%)                   |
| Неизправности на изделието                                                                                    | 0 (0%)      | 6 (10%)                  |

<sup>a</sup>На база на общия размер на извадката от 58 пациенти, тъй като 2 пациенти не са достигнали хемостаза по време на процедурата поради предишни ипсилатерални пункции. Хемостазата е постигната на 7-та минута и 37-та минута при тези пациенти.

<sup>b</sup>На база на общия размер на извадката от 59: 1 пациент не беше включен, тъй като беше поставен на изкуствено дишане поради белодробен оток и не можеше да се движи повече от седмица.

<sup>c</sup>Определя се като съдово усложнение, изискващо кръвопреливане или хирургично възстановяване, или локална инфекция, изискваща приложение на антибиотик, хоспитализация или удължаване на хоспитализацията, или дебридман на мястото

Не са наблюдавани сериозни съдови усложнения в част 1 на проучването. Имаше 1 сериозно съдово усложнение, съобщено в част 2 на проучването: псевдоаневризма, която беше съобщена в рамките на 1 ден след процедурата. Събитието наложи ултразвуково контролирана компресия и инжектиране на тромбин в псевдоаневризмата, както и удължаване на хоспитализацията на пациента.

От 5 нежелани събития, докладвани в част 1 на проучването, имаше 1 вероятно свързано с изделието нежелано събитие: несериозно събитие на обилно кървене на 1-ия ден след процедурата. От съобщените 19 нежелани събития в част 2 на проучването са наблюдавани 3 несериозни нежелани събития на хематом и 6 вероятно свързани с изделието несериозни събития, включително 3 съобщения за упорито леко кървене, 2 хематома и 1 болка в единия крак след тренировка.

В част 2 имаше 3 пациенти, които бяха определени като случаи на неуспешно лечение: 2 поради невъзможност за постигане на хемостаза без използване на компресия и 1 поради голямо съдово усложнение (псевдоаневризма). Няма установено неуспешно лечение в част 1 на проучването.

От шестте неизправности на изделието в част 2 на проучването три не попречиха на процедурата, една беше приписана на грешка на потребителя, една беше теч в катетъра и една беше скъсан филament. Последните два проблема бяха решени с актуализации на модела, внедрени в C11202.

Част 2 на клиничното проучване преди пускането на пазара не отчита резултатите от 6-месечното проследяване поради изпълнение на изискванията от страна на пациента. Резултатите от 30-дневното проследяване в клиничното проучване преди пускане на пазара (EU-SE-001), които са в съответствие с периода на проследяване в клиничната литература, показват, че FemoSeal™ VCS е безопасна и ефективна.

#### 1.4.2 Резюме на данните от клинични проучвания след пускане на пазара

В Таблица 1.6 по-долу са описани 4 завършени постмаркетингови клинични проучвания. Тези клинични изследвания не са публикувани, нито са достъпни онлайн.

**Таблица 1.6 Завършени клинични проучвания след пускане на пазара**

| Завършени клинични проучвания след пускане на пазара             |              |                                                                                     |                                                                                                                                 |                                                                                                                                                   |                                                                                           |

|  |  |  |  |  | или слабо съпротивление при поставяне в 226 (98,3%) от случаите.<br>152/230 (66,1%) от пациентите, лекувани с водача, включен в комплекта FemoSeal™ (GW 0,038") и препоръчан в FemoSeal™, без докладвани недостатъци на изделието или нежелани събития. |
|--|--|--|--|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Проучването през 2006 г. беше проведено, за да се потвърди безопасността и ефективността на настоящото изделие с подобрена система за доставяне и да се получи обратна връзка относно ИУ и програмата за обучение на FemoSeal™ VCS. Проучването включваше 100 пациенти и първичната крайна точка беше дали е постигната хемостаза или са необходими допълнителни ръчни или механични компресии. Това проучване заключава, че приложението на FemoSeal™ VCS е било успешно в повечето случаи (при 91% е постигната незабавна хемостаза).

Проучването през 2008 г. включваше 50 пациенти за оценка на безопасността и ефективността на FemoSeal™ VCS, когато се използва по време на нормална клинична практика при пациенти, подложени на сърдечна катетеризация с катетър 7 Fr. Първичната крайна точка на проучването беше да се съберат данни за времето до хемостаза и времето до раздвижване без допълнителна компресия, ръчна или механична. Резултатите от проучването показаха, че средното време за хемостаза е 57,8 секунди и всички пациенти са се раздвижили след 4 часа почивка на легло.

Проучването през 2009 г. беше за оценка на новата опаковка на FemoSeal™ VCS. В проучването бяха включени 25 пациенти. Първичната крайна точка беше дали потребителят е имал проблеми с опаковката. Потребителите не отбелязаха проблеми по отношение на новата опаковка на FemoSeal™ VCS. Това проучване също събираще данни за времето до хемостаза.

Целта на проучването от 2022 г. беше да събере проактивно данни за безопасността и ефективността на FemoSeal VCS при постигане на хемостаза на мястото за достъп през общата феморална артерия (CFA) при пациенти в реална среда, подложени на перкутанни ендоваскуларни процедури. В проучването бяха включени 230 пациенти. Първичните крайни точки за регистъра са успех на процедурата (т.е. успешна хемостаза на мястото на пункцията) и намаляване на сериозните усложнения (напр. съдово увреждане, кървене, свързано с мястото на достъп, инфекция на мястото на достъп, повторна ръчна компресия и нова остра ипсилатерална исхемия на крака, свързана с мястото на достъп). Проучването

заклучи, че FemoSeal VCS функционира добре в реални условия и осигурява ефективна хемостаза и ниски нива на усложнения на мястото на достъп за пациенти, подложени на периферни ендоваскуларни интервенции. Беше демонстрирана добра ефективност с кратко време до хемостаза и добра обратна връзка за удобството на оператора, което прави FemoSeal VCS ценно изделие за затваряне на феморален достъп.

### 1.4.3 Резюме на данните от клинични проучвания след пускане на пазара

#### 1.4.3.1 Завършени постмаркетингови клинични проследявания

Обобщение на завършените дейности за клинично проследяване след пускане на пазара е описано в Таблица 1,7 по-долу.

**Таблица 1.7. Постмаркетингови дейности за клинично проследяване**

| Завършени постмаркетингови клинични проследяващи дейности                 |             |                                                                         |                                                                                                                                                                                                       |                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Terumo Medical Corporation попълни три висококачествени проучвания на потребителите-лекари през текущия отчетен период (01 септември 2019 г. - 31 август 2024 г.).

Клиничните анкети за FemoSeal™ събраха проактивни клинични данни във връзка с безопасността и действието на FemoSeal™ VCS по време на клинична употреба.

Анкетата включваше въпроси, насочени към цялостното изделие и свързаните аксесоари, включително 0,038-инчовия водач, както и техните преки взаимодействия. Клиничните

анкети за водача събраха проактивни клинични данни по отношение на безопасността и действието по време на клинична употреба на 0,038-инчовия водач, доставен с FemoSeal™ VCS. Въпросите в анкетата бяха насочени конкретно към общата употреба на водача, от поставянето през процедурния катетър в съда до отстраняване на водача.

FemoSeal™ VCS и 0,038-инчовия водач, включен към изделието, получиха приемливи оценки, като бяха подадени шест (6) оплаквания за изделието и девет (9) несъответствия, свързани с водача, въз основа на оценка на коментарите, получени от висококачествените клинични анкети. Беше направена оценка на оплакванията както за FemoSeal, така и за водача, и те бяха анализирани като част от процеса на постмаркетингово наблюдение на Terumo. Няма установени нови рискове и/или нива на риск.

През 2024 г. беше завършено проучване на потребителите на лекари като част от дейностите по PMCF. Резултатите от проучването показаха, че оценката на ефективността и безопасността на FemoSeal™ VCS като цяло са много благоприятни. Съвместимостта на жични водачи, различни от стандартния, предоставен с FemoSeal™ VCS, също е демонстрирана.

#### **1.4.3.2 Текущо/планирано клинично проследяване след пускане на пазара**

ТМС има едно текуща/планирана дейност за постмаркетингово клинично проследяване. Ще бъде проведена клинична анкета за проспективно получаване на обратна връзка по отношение на използването на водача с FemoSeal VCS, разпространяван на пазара на ЕС. Анкетата ще бъде попълнена от лекарите, за да се проучи кои водачи са използвали по време на процедурата. Целта на това проучване е да се отстрани пропуск, идентифициран като липса на литература и коментари от външни рецензенти относно съвместимостта на FemoSeal™ VCS с използването на други жични водачи от други марки, различни от Terumo. Обратната връзка включва технически резултати, клинично представяне и безопасност, свързани с работата на изделието с различни водачи.

#### **1.4.4 Резюме на данните от систематичния преглед на литературата**

Terumo Medical Corporation провежда системни прегледи на литературата, за да събере и оцени клиничните данни за безопасност и ефективност от публикувани проучвания на FemoSeal™ VCS и/или подобни устройства. Целта на ежегодния преглед на публикуваната литература е да се идентифицират неизвестни досега странични ефекти, да се наблюдават известните странични ефекти, да се идентифицират възникващи рискове и да се идентифицира евентуална системна злоупотреба или употреба не по предназначение на AFemoSeal™ VCS.

Най-скорошният системен преглед на литературата, който обхваща периода от 1 септември 2019 г. до 31 август 2024 г., идентифицира 29 публикувани проучвания, които предоставят данни за клинична безопасност и ефективност на устройството FemoSeal™ VCS. В девет проучвания са докладвани двадесет и три референции за употреба на FemoSeal™ VCS върху етикета и употреба извън етикета. Като цяло прегледът на литературата от проучвания, специфични за употребата на FemoSeal™ VCS, показва изследвана популация, която е представителна за пациентите в ЕС, подложени на процедури за перкутанна съдова катетеризация. Вижте **Раздел 3** за списък на тези 23 рецензирани публикации.

Клиничното представяне беше оценено чрез следните мерки:

- Времето до хемостаза е по-добро или сравнимо с най-съвременните технологии за перкутанно затваряне на феморална артерия.
- Времето до раздвижване е по-добро или сравнимо с най-съвременните технологии за перкутанно затваряне на феморална артерия.
- Процентът на следоперативните усложнения е сравним или по-нисък от настоящите стандарти за грижа.

Въз основа на тези мерки за клинично действие данните в този преглед на литературата показват, че FemoSeal™ VCS може да се използва успешно при затваряне на пункция на феморалната артерия (артериотомия) при пациенти, които са претърпели перкутанна катетеризация с използване на 7 Fr или по-малък процедурен катетър. Пълна хемостаза беше постигната при мнозинството пациенти (79,65-100%) от случаите и беше свързана със средно време до хемостаза от 0,5 минути, средно време до изписване от 3 дни. Между 69,2 и 86,7% от пациентите бяха в състояние да се движат 5 часа след затварянето, със средна постоперативна почивка в леглото от 349 минути. Неизправност на FemoSeal™ VCS е наблюдавана в 3,68 - 4% от случаите, а допълнителна ръчна компресия е била необходима в 0,9 - 4,4% от процедурите.

Клиничната безопасност беше оценена чрез нежеланите събития, включително, но не само:

- Кървене
- Хематом
- Псевдоаневризма
- Синина
- Артериовенозна фистула
- Инфекция
- Смърт

За всяко от тези нежелани събития честотата на възникване, докладвана за FemoSeal™ VCS във включените проучвания, е по-ниска или сравнима с исторически докладваните честоти при ръчна компресия и други устройства за затваряне на съдове.

Не бяха идентифицирани нежелани събития при прегледа на 10 съобщения за случаи, тъй като не бяха идентифицирани нови, неочаквани, възникващи или неприемливи рискове.

Общата ефективност на използването на FemoSeal™ VCS по време на диагностична ангиография или интервенционални операции зависи от множество фактори, като пол, възраст, анатомия на пациента, съпътстващи заболявания, анатомично разположение на мястото на пункцията, опит на хирурга, метод на поставяне на VCD, следоперативни грижи, и др. В допълнение към техническия успех, включително постигане на хемостаза, FemoSeal™ VCS предлага КЛИНИЧНА полза по отношение на затварянето на съдовете след пункция на феморалната артерия, като например намаляване на времето до хемостаза, намаляване на времето до възстановяване. Резултатите от представянето на изследваните изделия съответстват на тези, очаквани за този тип изделие, когато се използват по предназначение. Някои от референциите, извлечени по време на текущия период на търсене, показват употребата на въпросното изделие на анатомично място, различно от общата феморална артерия, и за затваряне на артериотомии > 7 Fr, което се счита за извън етикета.

По време на прегледа не са идентифицирани неизвестни странични ефекти, възникващи рискове или възможна систематична злоупотреба с изделието. Въпреки това, ако FemoSeal™ VCS се използва внимателно от обучени лекари, медицинското изделие функционира като полезно и необходимо клинично изделие. Като цяло целевата терапия и следователно FemoSeal™ VCS отговарят на клиничната нужда, която съществува понастоящем при лечението на усложнения, свързани със съдовия достъп.

Като цяло, данните в този преглед на литературата не идентифицират никакви проблеми с ефективността или безопасността в клинична среда, които преди това са били неизвестни, нито нежелани ефекти, които са настъпили при по-високи от очакваните/приемливи проценти. Следователно от този преглед на литературата може да се заключи, че FemoSeal™ VCS, когато се използва за осигуряване на компресия за хемостаза при артериотомия след перкутанна катетеризация, продължава да работи според очакванията и не е свързана със сериозни събития по отношение на безопасността.

#### **1.4.5 Резюме на данните от клинични проучвания след пускане на пазара**

Въведена е проактивна система за постмаркетингово наблюдение (PMS) и прегледът на всички оплаквания се извършва ежемесечно и в съответствие с вътрешните производствени процедури. Данните за оплакванията бяха анализирани през периода от 1 септември 2019 г. до 31 август 2024 г. Като цяло има 28 доклада от наблюдение на медицинските изделия (MDV) и 476 доклада за оплаквания от клиенти, подадени до производителя. От 28 доклада за MDV, 27 са свързани с нежелани събития и един с неизправност на изделието. Имаше два смъртни случаи през отчетния период, но нито

един от докладваните смъртни случаи не беше определен като свързан с изследваното изделие. От 476-те оплаквания, отправени към производителя, най-честите причини за оплаквания са затруднения при разгръщането (146 случаи, 0,0142% честота на възникване). Режимът на неизправност на събитията на изтегляне е вторият най-често срещан с честота от 0,0126% (130 събития).

FemoSeal Vascular Closure System има над 1 030 136 продажби в световен мащаб и 827 843 в Европейското икономическо пространство. Изчислената честота на оплакванията въз основа на глобалните продажби е 0,046%. Общият процент на оплаквания от клиенти е много нисък. Не са установени нови рискове, които да не са включени в инструкциите за употреба и документацията за риска.

Честотата на нежеланите странични ефекти е показана в **Таблица 1.2**. Не са идентифицирани нови непредвидени, възникващи или неприемливи рискове. Не са наблюдавани значими увеличения на честотата или тежестта на известните нежелани странични ефекти.

#### **1.4.6 Общо резюме на клиничното действие и безопасността**

FemoSeal™ Vascular Closure System е предназначена за затваряне на пункция на общата феморална артерия (артериотомия) при пациенти, които са били подложени на перкутанна катетеризация с помощта на 7F (2,33 mm) или по-малък процедурен катетър. Тази клинична оценка се основава на изчерпателен анализ на наличните клинични данни и литература преди и след пускане на пазара, свързани с предназначението на FemoSeal™ VCS.

Извършен е цялостен преглед на публикуваната литература за периода от 1 септември 2019 г. до 31 август 2024 г. Доказателствата включват 29 проучвания за FemoSeal™ VCS. Доказателствата, предоставени в клиничната оценка, заключават, че когато се използва според показанията, въпросното изделие е безопасно и ефективно и всички рискове или нежелани странични ефекти, които могат да бъдат свързани с изделието при нормални условия на употреба, представляват приемливи рискове, когато се претеглят спрямо ползите за пациента. Резултатите от представянето на изследваните изделия съответстват на тези, очаквани за този тип изделие, когато се използват по предназначение.

Потенциалните нежелани странични ефекти, свързани с употребата на FemoSeal™ VCS включват нежеланите събития, често съобщавани при алтернативните начини за затваряне на артериотомия, напр. кръвоизлив и хематом. Като цяло честотата на поява на нежелани събития, докладвани при използването на FemoSeal™ VCS, е подобна на честотата, докладвана при ръчна компресия и подобни изделия за съдово затваряне. По-конкретно, за кръвоизлив и хематом съобщените проценти за FemoSeal™ са по-ниски от съобщените проценти за подобни изделия за съдово затваряне. Всяко от докладваните нежелани

събития, както от публикуваната литература, така и от постмаркетинговото наблюдение, е било предварително идентифицирано (вж. **Раздел 1.3**).

Съществуващите данни относно клиничната безопасност и действието на FemoSeal™ VCS предполагат, че ползите за пациентите от използването на това изделие за затваряне на съдове надвишават евентуалните рискове, когато се използва в съответствие с инструкциите за употреба.

Както е посочено в предишните раздели по-горе, предоставените данни за FemoSeal™ VCS демонстрират съответствие между данните, свързани с оценяваното устройство (напр. използване на устройството, резултати по отношение на безопасността, клинична ефективност и клинични ползи) и идентифицирани еквивалентни устройства и данните, свързани с подобни устройства, посочени сред най-съвременните технологии.

Кръстосаният анализ на данните за безопасност не установи несъответствия между:

- Данните, посочени за най-съвременните технологии
- Данните, специфични за оценяваното устройство
- Данните, посочени във файла/файловете за управление на риска
- Данните, посочени на етикета и/или в инструкциите за употреба (т.е. адресирани са остатъчните рискове, които трябва да бъдат съобщени на потребителя).

Клиничната безопасност е доказана чрез нисък процент на усложнения, идентифицирани в публикуваната рецензирана клинична литература, спонсирани от компанията клинични проучвания, преглед на данните след пускане на пазара, съчетани с липса на изтегляне от пазара. Не са установени проблеми с ефективността, прегледаната литература съдържа използване на FemoSeal™ VCS, което е в съответствие с предназначението на производителя.

### **1.5 Възможни диагностични или терапевтични алтернативи**

Ръчната компресия традиционно се използва за постигане на хемостаза на мястото на артериотомия след съдови катетеризации. Ръчната компресия е свързана с обездвижване на пациента за дълги периоди от време (до 8 часа след процедурата) и със значителен дискомфорт и продължителен болничен престой. Наскоро проведен систематичен преглед установи, че средното време за постигане на хемостаза с ръчна компресия е 20,8 минути<sup>1</sup>.

Алтернативите на ръчната компресия включват външни хемостатични изделия, които прилагат механична компресия на мястото на артериотомията. Тези изделия не съкращават времето до хемостаза или времето до раздвижване, но намаляват изискванията за персонал чрез замяна на ръчната компресия с механична компресия. Честотата на нежеланите събития, свързани с използването на механична компресия, е подобна на честотата при ръчна компресия.

Устройствата за затваряне на съдове, като FemoSeal™ VCS, са проектирани да затворят артериотомията. Целта им е да намалят времето до хемостаза и да дадат възможност за по-ранно раздвижване. Наскоро проведен систематичен преглед, включващ 13 налични в търговската мрежа устройства, установи, че средното време за постигане на хемостаза с устройство за затваряне на съдове е 5.4 минути. Средното време до хемостаза за отделните изделия за затваряне на съдове варира от 1 минута (FemoSeal™ VCS) до 14 минути; като при повечето изделия е между 4 и 10 минути<sup>1</sup>.

Често съобщаваните нежелани събития, свързани със затваряне на мястото на артериотомия с ръчна компресия, външни хемостатични изделия или изделия за затваряне на съдове, включват хематом, кървене на мястото на достъп, псевдоаневризма, артериовенозна фистула и инфекция. Същият систематичен преглед (34 рандомизирани контролирани изпитвания, 14 401 пациенти) установи, че честотата на нежеланите събития е сходна между ръчната компресия и използването на изделия за затваряне на съдове, с изключение на това, че кървенето е склонно да бъде малко по-високо при изделията за затваряне на съдове<sup>1</sup>.

## 1.6 Предложен потребителски профил и обучение

Целевите потребители на FemoSeal™ Vascular Closure System са лекари с обучение, което ги квалифицира да извършват артериален достъп и затваряне след ендоваскуларни процедури през общата феморална артерия и които са участвали в програмата за обучение на лекари на Terumo Medical Corporation за FemoSeal™.

## 1.7 Приложими хармонизирани и общи стандарти

Cílem tohoto souhrnu údajů o bezpečnosti a klinické funkci (SSCP) je zajistit veřejný přístup k aktualizovanému souhrnu hlavních aspektů bezpečnosti a klinické funkce systému na uzavírání cév FemoSeal™ Vascular Closure System (VCS).

Souhrn údajů o bezpečnosti a klinické funkci prostředku určený pro uživatele / zdravotnické pracovníky je uveden níže v **části 1.0**.

## **1.0 SOUHRN PRO UŽIVATELE / ZDRAVOTNICKÉ PRACOVNÍKY**

SSCP není určen jako náhrada návodu k použití, který je hlavním dokumentem k zajištění bezpečného používání prostředku, ani není určen k poskytování doporučení týkajících se diagnostiky nebo léčby určeným uživatelům nebo pacientům. Cílem SSCP není nahradit povinné údaje na kartě s informacemi o implantátu ani v žádných jiných povinných dokumentech.

### **1.1 Určené použití prostředku**

#### **1.1.1 Určené použití**

Systém FemoSeal™ Vascular Closure System je zdravotnický prostředek určený k uzavření arteriální punkce po perkutánní katetrizaci přes společnou femorální tepnu.

#### **1.1.2 Indikace pro použití**

Systém FemoSeal™ Vascular Closure System je indikován k použití při uzavírání punkce společné femorální tepny (arteriotomie) u pacientů, kteří podstoupili perkutánní katetrizaci pomocí zavaděče velikosti 7F (2,33 mm) nebo menšího.

#### **1.1.3 Kontraindikace a/nebo omezení**

Systém FemoSeal™ Vascular Closure System je kontraindikován u pacientů s arteriotomiemi, u nichž byly použity zavaděče nebo prostředky větší než 7F (2,33 mm).

#### **1.1.4 Cílové populace pacientů**

Bezpečnost a účinnost systému FemoSeal™ Vascular Closure System byla stanovena u pacientů starších 18 let, kteří podstoupili perkutánní katetrizaci s použitím zavaděče velikosti 7F (2,33 mm) nebo menšího.

#### **1.1.5 Zvláštní populace pacientů**

Bezpečnost a účinnost systému FemoSeal™ Vascular Closure System nebyla stanovena u následujících populací pacientů:

- pacienti s již existujícím autoimunitním onemocněním,
- pacienti podstupující terapeutickou trombolýzu,
- pacienti s klinicky významným periferním cévním onemocněním,
- pacienti s nekontrolovanou hypertenzí (> 220 mmHg u systolického tlaku nebo > 110 mmHg u diastolického tlaku),
- pacienti s krvácivou poruchou, včetně trombocytopenie (počet trombocytů < 100 000) nebo anémie (Hgb < 10 mg/dl),

- pacienti s vnitřním lumenem společné femorální tepny menším než 5 mm,
- pacienti s poruchou funkce ledvin a/nebo jater,
- pacienti s jinou relevantní komorbiditou,
- populace s určitým rasovým a/nebo etnickým původem,
- pacienti s infarktem myokardu během 72 hodin,
- pacienti s cévním štěpem nebo stentem v místě vpichu,
- pacientky, které jsou těhotné nebo kojí,
- pacienti mladší 18 let.

### 1.1.6 Určení uživatelé

Určenými uživateli systému FemoSeal™ Vascular Closure System jsou lékaři, kteří jsou vyškoleni v oblasti vytváření a uzavírání arteriálního přístupu k provádění endovaskulárních výkonů přes společnou femorální tepnu a absolvovali školicí program pro lékaře o prostředku FemoSeal™ společnosti Terumo Medical Corporation.

## 1.2 Popis prostředku

### 1.2.1 Popis prostředku

Systém FemoSeal™ Vascular Closure System, který vyrábí společnost Terumo Medical Corporation (TMC), je vstřebatelný prostředek na uzavírání cév určený k dosažení hemostázy po perkutánní katetrizaci přes společnou femorální tepnu.

Uzavírací prvky systému FemoSeal™ se skládají ze dvou vstřebatelných polymerních disků, vnitřního uzavíracího a vnějšího zamykacího disku, které jsou spojeny vstřebatelným pleteným vláknem a tím mechanicky utěšňují arteriotomii (viz **obrázek 1.1** a **obrázek 1.2**). Po umístění přes zavaděč s kuželovitým pouzdem se vnější zamykací disk přitlačí na dřík z pleteného vlákna, čímž dojde k mechanickému uzavření místa vpichu mezi vnitřním a vnějším zamykacím diskem. Vnitřní uzavírací a vnější zamykací disk drží na místě třením o dřík z pleteného vlákna. Hemostázy je dosaženo mechanickými prostředky. Uzavírací prvky se rozkládají hydrolyzou.

Implantovatelné uzavírací součásti, vnitřní uzavírací a vnější zamykací disk, se rozloží za osmnáct (18) měsíců, zatímco u pleteného vlákna se odhaduje, že rozklad a vstřebání hydrolyzou okolní tkáně nastane po dvou (2) až třech (3) letech. Schopnost implantovatelných uzavíracích součástí udržovat kompresi arteriotomie byla testována po dobu až osmi (8) hodin. Produkty rozkladu jsou metabolizovány a vylučovány močí nebo ve formě oxidu uhličitého vydechovány plícemi. Ve studiích na zvířatech nebyly pozorovány žádné kumulativní účinky. Dalšími součástmi systému

FemoSeal™, které se během výkonu dostanou do styku s živou tkání nebo krví, jsou zavaděč s kuželovitým pouzdem, dilatátor, přechovací trubice, zasunovací prvek a vodící drát.

**Obrázek 1.1 Vnitřní uzavírací disk a vnější zamykací disk**

**Obrázek 1.2 Umístění vnitřního uzavíracího a vnějšího zamykacího disku**

Jednotka FemoSeal™ je balena společně s dilatátorem a vodícím drátem o délce 70 cm (27,5") s vnějším průměrem 0,97 mm (0,038") a s vyrovnávačem ve tvaru J, viz **obrázek 1.3** níže. Vodicí drát je uzavřen v polyetylenové hadičce. Všechny součásti jsou zabaleny na pevné papírové podložce. Balení obsahuje také kartu s informacemi o implantátu pacienta. Systém FemoSeal™ Vascular Closure System nevyžaduje další příslušenství, aby mohl fungovat tak, jak má, a je určen pouze pro použití s dilatátorem a vodícím drátem, které jsou součástí balení výrobku.

\*Implantovatelná část prostředku; implantovatelné součásti jsou bezpečné při MR

Systém FemoSeal™ VCS je sterilizován etylenoxidem (EO) a je to zdravotnický prostředek pro jedno použití. Systém FemoSeal™ VCS je navržen tak, aby jej nebylo možné použít znovu.

### **Způsob účinku**

Systém FemoSeal™ VCS podporuje mechanickou hemostázu umístěním implantovatelných uzavíracích prvků uvnitř a vně společné femorální tepny. Mechanismus, který zabraňuje krvácení, zajišťuje vnitřní uzavírací disk, který utěsňuje místo vpichu, a vnější zamykací disk, který drží vnitřní uzavírací disk na místě.

### **1.2.3 Klinický přínos**

Systém FemoSeal™ VCS poskytuje v souvislosti s uzavřením cévy po punkci společné femorální tepny následující klinické přínosy:

- Zkrácení doby do dosažení hemostázy<sup>1</sup>
- Zkrácení doby do mobilizace pacienta<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Předchozí generace nebo varianty

- První verze systému FemoSeal™ VCS (č. 11200) se prodávala na evropském trhu v průběhu roku 2005 a po část roku 2006.
- Současný systém FemoSeal™ VCS (č. 11202) s vylepšeným zaváděcím systémem je na trhu od 28. března 2006.

#### 1.2.5 Příslušenství určené k použití v kombinaci s prostředkem

Jednotka FemoSeal™ je balena společně s dilatátorem, vodicím drátem o délce 70 cm (27,5") s vnějším průměrem 0,97 mm (0,038") a s vyrovnávačem ve tvaru J. Vodicí drát je příslušenstvím jednotky FemoSeal™. Vyrovnávač ve tvaru J je součástí vodicího drátu, zatímco dilatátor je součástí jednotky FemoSeal™. Vodicí drát je jediným vhodným příslušenstvím. Vodicí drát je uzavřen v polyetylenové hadičce. Všechny součásti jsou zabaleny na pevné papírové podložce. Balení obsahuje také kartu s informacemi o implantátu pacienta. Systém FemoSeal™ Vascular Closure System nevyžaduje další příslušenství, aby mohl fungovat tak, jak má, a je určen pouze pro použití s dilatátorem a vodicím drátem, které jsou součástí balení výrobku.

#### 1.2.6 Další prostředky a výrobky určené k použití v kombinaci s prostředkem

Systém FemoSeal™ VCS nevyžaduje k tomu, aby mohl fungovat tak, jak má, žádné další prostředky.

### 1.3 Rizika a výstrahy

#### 1.3.1 Zbytková rizika a nežádoucí účinky

Známé nebo předvídatelné nežádoucí příhody, poškození a komplikace spojené s použitím prostředku FemoSeal™ VCS v důsledku zbytkových rizik jsou uvedeny v **tabulce 1.2**. Četnost výskytu je založena na analýze dokumentace rizik a vypočítávána na základě údajů ze sledování po uvedení na trh od 1. září 2019 do 31. srpna 2024. Pro systém FemoSeal™ VCS nejsou známa žádná zbytková rizika a všechna příslušná rizika byla řešena prostřednictvím návodu k použití a procesu řízení rizik.

**Tabulka 1.2. Nežádoucí příhody / komplikace spojené s prostředkem FemoSeal**

| Újma                                   | Frekvence výskytu (%) | Zmírňující faktory                                                                                                                                           |
|----------------------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 1.3.2 Výstrahy a preventivní opatření

#### Výstrahy

1. Prostředek nepoužívejte, pokud je poškozen jeho obal nebo pokud je porušená některá ze sterilních bariér.
2. Prostředek nepoužívejte po uplynutí data expirace – biologicky rozložitelné součásti nemusí být dostatečně funkční.
3. Prostředek nepoužívejte, pokud se některé jeho součásti zdají být poškozené nebo vadné.
4. Použití systému FemoSeal™ Vascular Closure System v případech, kdy mohlo dojít k bakteriální kontaminaci zavaděče nebo okolní tkáně, může způsobit infekci.
5. Pokud existuje podezření, že došlo k punkci zadní arteriální stěny, nebo byla provedena více než jedna arteriální punkce, nespolehejte při zajišťování arteriální hemostázy výhradně na systém FemoSeal™ Vascular Closure System. Použijte dodatečnou manuální nebo mechanickou kompresi.
6. Pokud se místo vpichu nachází v oblasti bifurkace společné femorální tepny nebo distálně od ní, systém FemoSeal™ Vascular Closure System se nemá použít, protože by hrozilo riziko nesprávného umístění uzavíracího disku. To by mohlo vést ke krvácivým komplikacím a/nebo k narušení normálního průtoku krve.
7. Pokud dochází k přetrvávajícímu arteriálnímu krvácení z místa incize, neodřezávejte pletené vlákno, dokud nebude dosaženo hemostázy. Pokud není dosaženo hemostázy, připevněte pletené vlákno sterilním krytím na rány a proveďte dodatečnou kompresi, dokud nebude dosaženo hemostázy. V případě přetrvávajícího arteriálního krvácení mohou nastat závažné krvácivé komplikace, které mohou vést k poranění nebo smrti pacienta.
8. Nepoužívejte systém FemoSeal™ Vascular Closure System, pokud se místo vpichu nachází proximálně od tříselného vazů, protože by to mohlo způsobit retroperitoneální hematom.
9. Pacienti s vyšším rizikem krvácení mohou utrpět zvýšenou ztrátu krve vyžadující transfuzi.
10. Pokud se uvolní uzavírací disk, může potenciálně způsobit trombotickou a/nebo embolickou příhodu.

#### Preventivní opatření

1. Zárok zavedení systému FemoSeal™ Vascular Closure System by měli provádět lékaři s odpovídajícím školením v používání prostředku.

2. Před zavedením systému FemoSeal™ Vascular Closure System proveďte zjednodušený femorální angiogram nebo ultrazvukem naváděnou femorální punkci.
3. V následujících případech zákrok přerušte:
  - průměr lumen společné femorální tepny < 5 mm,
  - přítomnost stenózy a/nebo významného plaku v blízkosti místa punkce společné femorální tepny,
  - arteriální punkce se nachází v místě bifurkace femorální tepny nebo distálně k němu,
  - přítomnost anomálních větví nebo cévních abnormalit v blízkosti místa punkce společné femorální tepny.
4. Pokud je přítomen hematoma, je třeba věnovat zvláštní pozornost správnému zavedení zavaděče s kuželovitým pouzdrům do tepny.
5. Použijte techniku punkce jedné stěny. Nepropíchněte zadní stěnu tepny.
6. Při používání systému FemoSeal™ Vascular Closure System stále dodržujte sterilitu postupy.
7. Systém FemoSeal™ Vascular Closure System je určen pouze k jednorázovému použití a nesmí se v žádném případě opakovaně sterilizovat ani opakovaně používat. Jednotka FemoSeal™ je navržena tak, aby ji nebylo možné použít znovu.
8. Pokud se při zavádění vnitřního uzavíracího disku setkáte s neočekávaným odporem, zákrok přerušte.
9. Pro správné umístění vnitřního uzavíracího disku přesuňte palec tak, aby se tlačítko mohlo volně vrátit do původní polohy.
10. Před umístěním vnějšího zamykacího disku se ujistěte, zda je hrot zavaděče s kuželovitým pouzdrům jednotky FemoSeal™ pod povrchem kůže. U pacientů s krátkou vzdáleností mezi společnou femorální tepnou a úrovní kůže může být vnější zamykací disk neúmyslně umístěn nad úroveň kůže.
11. Aby bylo možné provést umístění správně, může být před umístěním nutné provést incizi kůže.
12. Pokud je vnitřní uzavírací disk uvnitř tepny, ale není možné zcela stisknout tlačítko a umístit vnější zamykací disk, může být nutné prvky uzavíracího systému FemoSeal™ chirurgicky odstranit.
13. Pokud je potřeba během 18 měsíců provést opětovnou punkci stejné společné femorální tepny, je nutné opětovnou punkci provést nejméně jeden centimetr proximálně od předchozího místa přístupu systému FemoSeal™ Vascular Closure System.

14. Poučte pacienta, aby dodržoval pokyny lékaře týkající se kontroly místa uzavření.

15. Poučte pacienta, aby po dobu následujících 18 měsíců u sebe nosil informační kartu pacienta.

### **Preventivní opatření v době propuštění**

Dříve než budete zvažovat propuštění pacienta, proveďte u něj posouzení následujících klinických stavů:

1. krvácení a/nebo hematom v místě uzavření,
2. bolest při chůzi,
3. známky infekce v místě uzavření.

### **1.3.3 Bezpečnostní nápravná opatření v terénu**

Jedno bezpečnostní nápravné opatření v terénu týkající se systému FemoSeal™ VCS bylo provedeno v období od 1. září 2019 do 31. srpna 2024.

V roce 2022 společnost Terumo dobrovolně stáhla systém FemoSeal™ VCS z důvodu stížností na selhání při testování procesu a uvolnění šarže prostředku FemoSeal pro měření přechovací síly a retrakční síly vyrobeného společností Elkton. Z Jižní Koreje bylo staženo celkem 950 jednotek.

## **1.4 Klinické hodnocení a následné klinické sledování po uvedení na trh**

**Tabulka 1.3** obsahuje seznam hlavních studií provedených za účelem uvedení systému FemoSeal™ VCS na trh, jakož i studií a následných klinických činností po uvedení na trh.

V tabulce níže je uvedena i verze prostředku použitého ve studii. První verze systému FemoSeal™ VCS (č. 11200) byla na trhu do roku 2006, přičemž další verze (č. C11202) byla na trh uvedena v roce 2006 a je to verze, která je na trhu i v současnosti.

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002</p> <p>Radi Medical System AB</p> <p>Provedla společnost Biomatech, Francie</p> | <p>Studie na zvířatech</p> | <p>Účelem studie bylo vyhodnotit biokompatibilitu a biologickou funkčnost biologicky rozložitelného implantátu určeného k dosažení hemostázy v cévním systému. Zkoušený prostředek byl určen k zavedení do punkčního otvoru v tepnách za účelem dosažení hemostázy. Jeden disk byl zaveden do punkčního otvoru v tepně a druhý byl připevněn k vnitřnímu disku z vnější strany tepny. Oba disky byly zasunuty přes zaváděcí pouzdro. Disky byly navrženy tak, aby bránily krvácení, vhojily</p> | <p>Doba implantace / následného sledování je u všech zvířat 5 týdnů.</p> <p>4 ovce, 1 prase</p> <p>14 uzavíracích prvků</p> <p>8 uzavíracích prvků implantovaných do 2 ovcí</p> <p>2 uzavírací prvky implantované do 1 prasete</p> <p>Pokud byly dva uzavírací prvky implantovány do stejné femorální tepny, byly implantovány ve vzdálenosti &gt; 30 mm.</p> | <p>Byla zaznamenána kritéria jakýchkoli nežádoucích účinků (zánět, nekróza, krvácení nebo jakákoli jiná léze) nebo vznik jakékoli tenké vrstvy pseudointimy. Zvláštní pozornost byla věnována počáteční tkáňové integraci prostředku se zvláštním důrazem na zapouzdření vnitřního disku.</p> <p>Z makroskopického hlediska nebyly pozorovány žádné významné známky lokální intolerance nebo vzniku trombů. Makroskopické pozorování neodhalilo po implantaci uzavíracích</p>                                                                                                                                                                                                                 |

|--|--|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  |  | <p>se do cévní stěny a nakonec se rozložily a byly absorbovány. Studie byla navržena tak, aby po funkční implantaci do ovcí a prasete bylo možné shromáždit a analyzovat data k vyhodnocení schopnosti implantátu zachovat si fyziologickou funkci při použití v oběhovém systému, ke stanovení reakce hostitele a reakce prostředku (fyzikální integrita, zapouzdření tkáně při utracení) a k posouzení rozkladu implantátu.</p> | <p>prvků do femorální tepny žádný rozdíl mezi ovcí a prasetem. Z makroskopického hlediska nebyly pozorovány žádné významné známky lokální intolerance nebo vzniku trombů. Makroskopické pozorování neodhalilo po implantaci uzavíracích prvků do femorální tepny žádný rozdíl mezi ovcí a prasetem.</p> <p>Histopatologická analýza místa implantace u ovcí neprokázala žádné lokální nežádoucí účinky. Vnitřní i vnější disky vykazovaly známky rozkladu a v některých případech byly rozděleny na menší části. Vnitřní disky byly zcela integrovány do neointimální tkáně. U prasete ukázala histopatologická analýza o něco více známek zánětu kolem vnitřních i vnějších disků. U obou zvířat vykazovalo pletené vlákno o něco více známek zánětu než materiál disků, což je u pletených vláken normální z důvodu větší plochy povrchu.</p> <p>Průchodnost cévy byla měřena po 5 týdnech pomocí tří různých metod, histomorfometrie, histomorfometrie v kombinaci s měřením průměru cévy s použitím posuvného měřidla a s použitím barevného dopplerovského ultrazvukového vyšetření. Průměrná průchodnost</p> |

U prasete činila průměrná průchodnost cévy 40 až 80 % (2 pozorování).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|--|--|--|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

V rámci plánu klinického vývoje před uvedením systému FemoSeal™ VCS na trh byly provedeny 3 zkoušky funkčnosti na zvířatech. V roce 2000 byla před zahájením klinických studií provedena studie na zvířatech s cílem posoudit biologickou funkčnost systému FemoSeal™ VCS. Tato studie hodnotila schopnost uzavíracích prvků zachovat si fyziologickou funkci a posuzovala jejich rozklad. Po 18 měsících již materiál vnitřního a vnějšího disku nebyl viditelný a byl nahrazen endoluminální fibrózní tkání. V závěru byla schopnost uzavíracího prvku systému FemoSeal™ VCS zachovat si fyziologickou funkci v oběhovém systému potvrzena.

V roce 2002 byla provedena studie na zvířatech za účelem vyhodnocení biokompatibility a biologické funkčnosti biologicky rozložitelného implantátu, systému FemoSeal™ VCS, určeného k zajištění hemostázy v cévním systému. Souhrnně lze říci, že rozklad implantátu byl téměř dokončen do 36 týdnů a nedošlo k žádné významné nežádoucí reakci tkáně.

Biokompatibilitu a biologickou funkčnost biologicky rozložitelného implantátu, systému FemoSeal™ VCS, určeného k zajištění hemostázy v cévním systému, hodnotila v roce 2002 i další studie na zvířatech. Po 5 týdnech bylo zapouzdření disku dokončeno a byly pozorovány známky rozkladu vnitřního i vnějšího disku. V závěru byla schopnost implantátu zachovat si fyziologickou funkci v oběhovém systému potvrzena.

V rámci plánu klinického vývoje systému FemoSeal™ VCS provedla společnost Radi Medical System AB klinickou zkoušku před uvedením na trh. Tato klinická zkouška není zveřejněna ani není k dispozici online. V letech 2002–2004 byla provedena studie s modelem prostředku č. 11200 podle evropské normy EN 540 (Klinické zkoušky zdravotnických prostředků pro humánní účely) a v souladu s Obecnými úvahami ke klinickým hodnocením ICH a pokyny pro správnou klinickou praxi. Podrobnosti o této studii jsou zdokumentovány ve zprávě EU-SE-001. Klinická studie byla zdokumentována v závěrečné zprávě společnosti Radi Medical Systems AB „Multi-

Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures“. Klinická studie byla provedena s prvním modelem prostředku FemoSeal č. 11200 a byla zaměřena na bezpečnost a účinnost implantovatelných uzavíracích součástí. Jediným rozdílem mezi prvním modelem č. 11200 a současným modelem č. C11202 je velikost French, 6F, respektive 7F, a vylepšený systém zavádění. Klinický přínos, určené použití, princip fungování a suroviny implantovatelných uzavíracích prvků, vnitřního uzavíracího a vnějšího zamykacího disku, zůstávají beze změny.

Prostředek byl určen k použití u pacientů podstupujících diagnostické nebo intervenční kardiologické zákroky s využitím femorální tepny jako přístupového bodu. Cílem této studie bylo stanovit bezpečnost, funkčnost a účinnost systému FemoSeal™ VCS. Jednalo se o prospektivní multicentrickou otevřenou studii s jedním ramenem a s 30denním sledováním.

Primárním cílovým ukazatelem funkce byla doba do dosažení hemostázy, která byla definována jako absence aktivního krvácení. Primárním cílovým parametrem bezpečnosti byl výskyt závažných cévních komplikací do 30 dnů. Sekundární cílové parametry zahrnovaly dobu do mobilizace pacienta, míru selhání léčby, výskyt nežádoucích účinků a vlastnosti prostředku z hlediska účinnosti během zavádění a umístění.

Pacienti zařazení do této studie byli dospělí pacienti schopní poskytnout informovaný souhlas, kteří měli alespoň jeden intaktní pulz na arteria dorsalis pedis. Ze studie byli vyloučeni pacienti, kteří měli některý z následujících stavů:

- periferní cévní onemocnění v anamnéze,
- autoimunitní onemocnění,
- známá krvácivá porucha v podobě závažné anemie,
- INR > 1,5,
- infarkt myokardu během 72 hodin,
- nekontrolovaná hypertenze navzdory léčbě,
- obezita bránící přístupu Seldingerovou technikou,
- přítomnost cévního štěpu nebo stentu v místě arteriotomie,
- předchozí ipsilaterální punkce během 3 měsíců,
- očekávaná délka života < 6 měsíců.

Pacienti byli navíc vyšetřováni v průběhu zákroku a pokud byly pozorovány některé z následujících situací, byli ze studie vyřazeni:

- průměr lumen společné femorální tepny < 5 mm,

- arteriální větve ve vzdálenosti do 2 cm proximálně od místa vpichu,
- významná stenóza ve vzdálenosti do 3 cm od místa vpichu,
- použití primárního zaváděcího pouzdra > 6 Fr,
- punkce v místě femorální bifurkace nebo distálně od ní,
- vícenásobná femorální punkce,
- známá nebo suspektní punkce zadní stěny femorální tepny,
- velký hematom (2–6 cm) po dokončení zákroku,
- obtížné zavádění primárního zaváděče k provedení výkonu z důvodu vinuté tkáně nebo cévy.

Tato studie v rámci jednoho protokolu byla provedena ve dvou částech: Během části 1 bylo zařazeno 20 pacientů, poté byla provedena analýza bezpečnosti a během části 2 bylo zařazeno dalších 60 pacientů.

V části 1 byl průměrný věk zařazených pacientů 65,9 let, 70,0 % pacientů byli muži a 95 % pacientů současně užívalo léky. V části 2 studie byl průměrný věk 63,8 let, 78 % byli muži a 100 % pacientů současně užívalo léky.

Pro zařazení do studie byli způsobilí pacienti podstupující zákrok spočívající v diagnostické (část 1 a část 2) nebo intervenční (část 2) srdeční katetrizaci. Zákroky byly v každé z nemocnic účastnících se studie v souladu se standardní péčí a po nich následovalo použití systému FemoSeal™ VCS. Údaje o pacientech byly získány při vstupu do studie, během zákroku a 1 den a 30 dní po zákroku. Výsledky jsou shrnuty v **tabulce 1.5** a ukazují, že systém FemoSeal™ VCS je bezpečný a účinný pro použití u této populace pacientů.

**Tabulka 1.5 Klinické výsledky vykázané ve studii před uvedením na trh**

|                                                  | Část 1      | Část 2                   |
|--------------------------------------------------|-------------|--------------------------|
| Počet pacientů                                   | 20          | 60                       |
| Průměrná doba do dosažení hemostázy              | 1,2 minuty  | 1,6 minuty <sup>a</sup>  |
| Průměrná doba do mobilizace pacienta             | 72,2 minuty | 87,5 minuty <sup>b</sup> |
| Výskyt závažných cévních komplikací <sup>c</sup> | 0 (0 %)     | 1 (2 %)                  |
| Počet pacientů s nežádoucími účinky              | 5 (25 %)    | 19 (32 %)                |

|                                                                                                 |         |          |
|-------------------------------------------------------------------------------------------------|---------|----------|
| Selhání léčby (definované jako závažné cévní komplikace, potřeba manuální komprese, nebo obojí) | 0 (0 %) | 3 (5 %)  |
| Závady prostředku                                                                               | 0 (0 %) | 6 (10 %) |

<sup>a</sup>Na základě vzorku o celkové velikosti 58, protože u 2 pacientů nebylo dosaženo hemostázy v době zákroku z důvodu předchozí ipsilaterální punkce. U těchto pacientů bylo hemostázy dosaženo po 7 minutách a 37 minutách.

<sup>b</sup>Na základě vzorku o celkové velikosti 59: 1 pacient nebyl zařazen, protože byl napojen na ventilátor z důvodu pulmonálního edému a nebyl déle než týden schopen mobilizace.

<sup>c</sup>Definované jako cévní komplikace vyžadující krevní transfuzi nebo chirurgickou opravu nebo lokální infekce vyžadující podání antibiotika, hospitalizaci nebo prodloužení hospitalizace nebo debridement rány.

V části 1 studie nebyly pozorovány žádné významné cévní komplikace. V části 2 studie byla hlášena 1 významná cévní komplikace: pseudoaneuryzma, které bylo hlášeno během jednoho dne po zákroku. Tato příhoda vyžadovala ultrazvukem naváděnou kompresi a injekci trombinu do pseudoaneuryzmatu a prodloužila hospitalizaci pacienta.

Z 5 nežádoucích příhod hlášených v části 1 studie mohla 1 nežádoucí příhoda souviset s prostředkem: nezávažná příhoda aktivního krvácení 1 den po zákroku. Z 19 nežádoucích příhod hlášených v části 2 studie byly pozorovány 3 nezávažné nežádoucí příhody hematomu souvisejícího s prostředkem a 6 nezávažných příhod možná souvisejících s prostředkem, včetně 3 hlášení přetrvávajícího prosakování, 2 hematomů a 1 bolesti nohy po cvičení.

V části 2 byli 3 pacienti považováni za selhání léčby: 2 z důvodu nedosažení hemostázy bez použití komprese a 1 z důvodu závažné cévní komplikace (pseudoaneuryzma). V části 1 studie nedošlo k žádnému selhání léčby.

Ze šesti případů selhání prostředku v části 2 studie tři případy nenarušily zákrok, jeden byl připisován chybě uživatele, jedním byl únik ze zavaděče a jedním zlomený spoj vláken. Poslední dva problémy byly vyřešeny aktualizacemi modelu implementovanými v modelu C11202.

V části 2 klinické studie před uvedením na trh nebyly uvedeny výsledky sledování po 6 měsících v důsledku nespolupráce pacientů. Výsledky klinické studie před uvedením na trh (EU-SE-001) získané v rámci kontroly po 30 dnech, která je v souladu s dobou následného sledování uváděnou v klinické literatuře, ukazují, že systém FemoSeal™ VCS je bezpečný a účinný.

#### 1.4.2 Souhrn údajů z klinických studií po uvedení na trh

V **tabulce 1.6** níže jsou popsány 4 dokončené klinické studie po uvedení na trh. Tato klinická hodnocení nejsou publikována ani nejsou k dispozici online.

**Tabulka 1.6 Realizované klinické studie po uvedení na trh**

| Realizované klinické studie po uvedení na trh                                               |                                                          |                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                             |    |     |          |       |          |           |    |          |           |                         |          |                    |            |                     |           |                   |         |                       |          |                                |          |                      |           |                          |           |                                   |          |                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|--|--|--|--|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Studie z roku 2006 byla provedena za účelem potvrzení bezpečnosti a účinnosti současného prostředku s vylepšeným zaváděcím systémem a získání zpětné vazby k návodu k použití a školicímu programu systému FemoSeal™ VCS. Studie zahrnovala 100 pacientů a primárním cílovým ukazatelem bylo, zda bylo dosaženo hemostázy, nebo zda byla nutná další manuální nebo mechanická komprese. Tato studie dospěla k závěru, že použití systému FemoSeal™ VCS bylo ve většině případů úspěšné (v 91 % případů bylo dosaženo okamžité hemostázy).

Do studie z roku 2008 bylo zařazeno 50 pacientů za účelem posouzení bezpečnosti a klinické funkce systému FemoSeal™ VCS při použití v běžné klinické praxi u pacientů podstupujících srdeční katetrizaci se zaváděčem 7F. Primárním cílovým ukazatelem studie bylo shromáždit údaje o době do dosažení hemostázy a době do mobilizace pacienta bez další komprese, manuální nebo mechanické. Z výsledků studie vyplynul závěr, že průměrná doba do dosažení hemostázy činila 57,8 sekund a všichni pacienti byli mobilizováni po 4 hodinách klidu na lůžku.

Studie z roku 2009 byla zaměřena na hodnocení nového obalu systému FemoSeal™ VCS. Do studie bylo zařazeno 25 pacientů. Primárním cílovým parametrem bylo, zda uživatel zaznamenal jakékoli problémy s obalem. Uživatelé nezaznamenali žádné problémy týkající se nového obalu systému FemoSeal™ VCS. Tato studie také shromažďovala údaje o době do dosažení hemostázy.

Cílem studie z roku 2022 bylo aktivně shromáždit údaje o bezpečnosti a účinnosti systému FemoSeal VCS při dosahování hemostázy v místech přístupu do společné femorální tepny používaného při běžné klinické praxi u reálných pacientů podstupujících perkutánní endovaskulární zákroky. Do studie bylo zařazeno 230 pacientů. Primárními cílovými parametry registru jsou úspěch zákroku (tj. úspěšná hemostáza v místě vpichu) a snížení počtu závažných komplikací (např. cévní poranění, krvácení související s místem přístupu, infekce v místě přístupu, opakovaná manuální komprese a nová akutní ipsilaterální ischemie dolních končetin v místě přístupu). Studie dospěla k závěru, že systém FemoSeal™ VCS funguje v reálném prostředí dobře a u pacientů podstupujících periferní endovaskulární zákroky poskytuje účinnou hemostázu a nízkou míru komplikací v místě přístupu. Vykazuje dobrou funkčnost s krátkou dobou do dosažení hemostázy a dobrou zpětnou vazbu operátora, díky čemuž je systém FemoSeal™ VCS cenným prostředkem pro uzavírání femorálního přístupu.

### **1.4.3 Souhrn údajů z klinických studií po uvedení na trh**

#### **1.4.3.1 Dokončené klinické sledování po uvedení na trh**

Souhrn dokončených činností klinického sledování po uvedení na trh je popsán v **tabulce 1.7** níže.

**Tabulka 1.7. Následné klinické činnosti po uvedení na trh**

| Realizované následné klinické činnosti po uvedení na trh |  |  |  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------|--|--|--|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                          |  |  |  |  | 57,0 (36,0-81,0)<br>(medián (IQR)) <ul style="list-style-type: none"> <li>○ Všechna hodnocení výkonu systému FemoSeal™ VCS byla příznivá.</li> <li>○ Všechna hodnocení vodícího drátu dodávaného se systémem FemoSeal™ VCS byla příznivá.</li> <li>○ Jedna nežádoucí příhoda (0,8 %): disky systému FemoSeal™ VCS nebyly správně vyrovnány pravděpodobně kvůli použití tuhého vodícího drátu (Boston Scientific Amplatz Super Stiff, 75 cm, 0,035 palce), který vyžadoval manuální kompresi k dosažení hemostázy.</li> </ul> |

Společnost Terumo Medical Corporation provedla tři vysoce kvalitní průzkumy mezi lékaři a uživateli během aktuálního vykazovaného období (od 01. září 2019 do 31. srpna 2024).

V klinických průzkumech týkajících se prostředku FemoSeal™ byly shromážděny proaktivní klinické údaje ohledně bezpečnosti a klinické funkce systému FemoSeal™ VCS při klinickém použití. Průzkum zahrnoval otázky zaměřené na prostředek jako celek i na jeho související příslušenství včetně vodícího drátu o průměru 0,038" a jejich přímé interakce. V klinických průzkumech týkajících se vodícího drátu byly shromážděny proaktivní klinické údaje ohledně

bezpečnosti a klinické funkce při klinickém použití vodicího drátu o průměru 0,038" dodávaného se systémem FemoSeal™ VCS. Otázky průzkumu byly konkrétně zaměřeny na obecné použití vodicího drátu od jeho zavedení přes zavaděč do cévního systému až po odstranění drátu.

Systém FemoSeal™ VCS a vodicí drát o průměru 0,038", který je součástí prostředku, získal všechna přijatelná hodnocení. Na základě vyhodnocení komentářů získaných ve vysoce kvalitních klinických průzkumech bylo podáno šest (6) stížností týkajících se prostředku a devět (9) jiných komentářů týkajících se vodicího drátu. Stížnosti jak na prostředek FemoSeal, tak na vodicí drát byly vyhodnoceny a byly posouzeny v rámci procesu sledování společnosti Terumo po uvedení na trh. Nebyla identifikována žádná nová rizika nebo úrovně rizika.

V roce 2024 byl v rámci činností PMCF proveden průzkum mezi lékaři a uživateli. Výsledky průzkumu prokázaly, že hodnocení výkonu a bezpečnosti systému FemoSeal™ VCS je celkově velmi příznivé. Byla také prokázána kompatibilita s jinými vodicími dráty než s těmi, které jsou standardně dodávány s prostředkem FemoSeal™ VCS.

#### **1.4.3.2 Probíhající/plánovaná následná klinická sledování po uvedení na trh**

Společnost TMC provádí jednu probíhající/plánovanou klinickou činnost v rámci následného sledování po uvedení na trh. Bude proveden klinický průzkum, který bude výhledově zaměřen na získání zpětné vazby týkající se používání vodicího drátu se systémem FemoSeal VCS distribuovaným na trhu EU. Průzkum budou vyplňovat lékaři, kteří uvedou, jaké vodicí dráty během výkonu používali. Účelem tohoto průzkumu je vyřešit mezeru identifikovanou jako nedostatek literatury a komentářů externích recenzentů ke kompatibilitě systému FemoSeal™ VCS s použitím vodicích drátů jiných značek než Terumo. Zpětná vazba bude zahrnovat technické výsledky, klinickou funkci a bezpečnost související s funkčností prostředku s různými vodicími dráty.

#### **1.4.4 Souhrn údajů ze systematického přezkoumání literatury**

Společnost Terumo Medical Corporation provádí systematický přezkum literatury za účelem shromažďování a vyhodnocování údajů o klinické bezpečnosti a funkci z publikovaných studií týkajících se prostředku FemoSeal™ VCS a/nebo podobných prostředků. Cílem každoročního screeningu publikované literatury je identifikace dříve neznámých vedlejších účinků, sledování známých nežádoucích účinků, identifikace vzniklých rizik a identifikace možného systematického nesprávného použití nebo použití prostředku FemoSeal™ VCS mimo rozsah rozhodnutí o registraci.

Nejnovější systematický přezkum literatury, který zahrnoval období od 1. září 2019 do 31. srpna 2024, identifikoval 29 publikovaných studií, které poskytly údaje o klinické bezpečnosti a funkci prostředku FemoSeal™ VCS. V devíti studiích bylo hlášeno dvacet tři referencí použití systému FemoSeal™ VCS v rozsahu a mimo rozsah rozhodnutí o registraci. Celkově lze říci, že přehled literatury u studií specifických pro použití systému FemoSeal™ VCS ukazuje ve studiích

populaci, která je reprezentativní pro pacienty v EU podstupující perkutánní katetrizační zákroky. Seznam těchto 23 recenzovaných publikací v rozsahu rozhodnutí o registraci naleznete v **části 3.**

Klinická funkce byla posouzena na základě následujících parametrů:

- Doba do dosažení hemostázy je lepší nebo srovnatelná s nejnovějšími technologiemi uzavření společné femorální tepny po perkutánním zákroku.
- Doba do mobilizace je lepší nebo srovnatelná s nejnovějšími technologiemi uzavření společné femorální tepny po perkutánním zákroku.
- Míra pooperačních komplikací je srovnatelná nebo nižší než při současné standardní péči.

Na základě těchto ukazatelů klinické funkce vyplynulo z údajů v tomto přehledu literatury, že systém FemoSeal™ VCS lze úspěšně používat k uzavření femorální arteriální punkce (arteriotomie) u pacientů, kteří podstoupili perkutánní katetrizaci s použitím zavaděče velikosti 7F nebo menšího. Úplné hemostázy bylo dosaženo u většiny pacientů (79,65-100 %) a byla spojena s mediánovou dobou do dosažení hemostázy 0,5 minuty a průměrnou dobou do propuštění z nemocnice 3 dny. Od 69,2 do 86,7 % pacientů bylo schopno pohybovat se 5 hodin po uzavření, přičemž průměrná doba pooperačního odpočinku na lůžku byla 349 minut. Selhání systému FemoSeal™ VCS bylo pozorováno v 3,68-4 % případů a dodatečná manuální komprese byla potřebná v 0,9-4,4 % případů.

Klinická bezpečnost byla posouzena na základě nežádoucích příhod, které zahrnovaly mimo jiné:

- Krvácení
- Hematom
- Pseudoaneuryzma
- Odřenniny
- Arteriovenózní píštěl
- Infekce
- Smrt

U každého z těchto nežádoucích účinků byla míra výskytu hlášena při použití systému FemoSeal™ VCS v rámci zahrnutých studií nižší nebo srovnatelná s historicky hlášenými mírami při použití manuální komprese a jiných prostředků na uzavírání cév.

Při přezkumu 10 kazuistik nebyly zjištěny žádné nežádoucí účinky, neboť nebyla identifikována žádná nová, neočekávaná, vznikající nebo nepříjemná rizika.

Celková účinnost použití systému FemoSeal™ VCS během diagnostické angiografie nebo intervenčních operací závisí na několika faktorech, jako je pohlaví, věk, anatomie pacienta, komorbidita, anatomické umístění místa vpichu, zkušenosti chirurga, metoda zavedení VCD,

pooperační péče, atd. Kromě technického úspěchu, včetně dosažení hemostázy, nabízel systém FemoSeal™ VCS klinický přínos ve vztahu k uzavření cévy po vpichu do femorální tepny, jako je zkrácení doby do dosažení hemostázy a zkrácení doby do chůze. Výsledky týkající se klinické funkce prostředku FemoSeal™ VCS jsou v souladu s výsledky očekávanými u tohoto typu prostředku při použití v souladu s určeným účelem. Některé reference získané během aktuálního období vyhledávání ukázaly použití předmětného prostředku v jiném anatomickém umístění než ve společné femorální tepně a pro uzavření arteriotomií > 7 Fr, což je považováno za použití mimo rozsah rozhodnutí o registraci.

Během revize nebyly zjištěny žádné neznámé vedlejší účinky, nově vznikající rizika nebo možné systematické nesprávné použití prostředku. Nicméně pokud je systém FemoSeal™ VCS používán s opatrností vyškolenými lékaři, funguje zdravotnický prostředek jako užitečný a nezbytný klinický prostředek. Celkově cílová terapie, a tudíž systém FemoSeal™ VCS, řeší klinickou potřebu, která v současné době existuje při léčbě komplikací souvisejících s cévním přístupem.

Celkově lze říci, že v údajích v tomto přehledu literatury nebyly zjištěny žádné problémy s klinickou funkcí nebo bezpečností v klinickém prostředí, které by dříve byly neznámé, ani nežádoucí účinky, ke kterým by došlo ve vyšší míře, než se předpokládá / než je přijatelné. Z tohoto přehledu literatury lze proto vyvodit závěr, že systém FemoSeal™ VCS při použití k zajištění komprese pro dosažení hemostázy při arteriotomii po perkutánní katetrizaci funguje i nadále dle očekávání a není spojen s vážnými bezpečnostními příhodami.

#### 1.4.5 Souhrn údajů ze sledování po uvedení na trh

Je zaveden systém aktivního sledování po uvedení na trh a každý měsíc se provádí přezkum všech reklamací v souladu s interními výrobními postupy. Údaje o reklamacích byly analyzovány v období od 1. září 2019 do 31. srpna 2024. Celkově bylo výrobcí předloženo 28 hlášení v rámci vigilance pro zdravotnické prostředky (MDV) a 476 hlášení o zákaznických reklamacích. Z 28 hlášení MDV souviselo 27 s nežádoucími účinky a jeden s poruchou prostředku. Během vykazovaného období došlo ke dvěma úmrtím, ale žádné z hlášených úmrtí nebylo považováno za související s předmětným prostředkem. Ze 476 reklamací podaných výrobcí byly nejčastějšími důvody obtíže při nasazení (146 výskytů, četnost výskytu 0,0142 %). Druhým nejčastějším výskytem je poruchový režim příhod vytažení s četností 0,0126 % (130 událostí).

V celém světě bylo prodáno více než 1 030 136 prostředků FemoSeal™ Vascular Closure System, z toho 827 843 v Evropském hospodářském prostoru. Vypočítaná četnost reklamací na základě celosvětového prodeje je 0,046 %. Celková míra reklamací zákazníků je velmi nízká. Nebyla zjištěna žádná nová rizika, která by nebyla uvedena v návodu k použití a v dokumentaci týkající se rizik.

Frekvence výskytu nežádoucích účinků je uvedena v **tabulce 1.2**. Nebyla identifikována žádná nová nepředvídaná, vznikající nebo nepřijatelná rizika. Nebylo pozorováno žádné významné zvýšení četnosti nebo závažnosti známých nežádoucích vedlejších účinků.

#### 1.4.6 Celkový souhrn údajů o klinické funkci a bezpečnosti

Systém FemoSeal™ VCS je indikován k použití při uzavírání punkce společné femorální tepny (arteriotomie) u pacientů, kteří podstoupili perkutánní katetrizaci pomocí zavaděče velikosti 7F (2,33 mm) nebo menšího. Toto klinické hodnocení vychází z komplexní analýzy dostupných klinických údajů před uvedením na trh a po uvedení na trh a z literatury týkající se určeného použití prostředku FemoSeal™ VCS.

Byl proveden komplexní přezkum literatury publikované v období od 1. září 2019 do 31. srpna 2024. Soubor důkazů zahrnoval 29 studií týkajících se prostředku FemoSeal™ VCS. Z důkazů poskytnutých v klinickém hodnocení lze učinit závěr, že dotčený prostředek je při použití v souladu s určeným použitím bezpečný a účinný a veškerá rizika nebo nežádoucí účinky, které mohou být za normálních podmínek použití s prostředkem spojeny, představují při zvážení přínosů pro pacienta přijatelná rizika. Výsledky týkající se klinické funkce dotčených prostředků jsou v souladu s výsledky očekávanými u tohoto typu prostředku při použití v souladu s určeným účelem.

Potenciální nežádoucí účinky spojené s použitím systému FemoSeal™ VCS zahrnují nežádoucí příhody běžně hlášené u alternativních prostředků na uzavření arteriotomie, např. krvácení a hematom. Celkově byla frekvence výskytu nežádoucích příhod hlášených při použití systému FemoSeal™ VCS podobná jako frekvence hlášené při použití manuální komprese a podobných prostředků na uzavírání cév. Konkrétně u krvácení a hematomu byla frekvence hlášená při použití systému FemoSeal™ VCS nižší než frekvence hlášené při použití podobných prostředků na uzavírání cév. Všechny nahlášené nežádoucí příhody, jak z publikované literatury, tak i ze sledování po uvedení na trh, byly identifikovány již dříve (viz **část 1.3**).

Stávající údaje týkající se klinické bezpečnosti a funkce systému FemoSeal™ VCS naznačují, že přínosy použití tohoto prostředku na uzavírání cév pro pacienta převažují nad jeho možnými riziky, pokud je používán v souladu s návodem k použití.

Jak je uvedeno v předchozích částech výše, údaje získané o prostředku FemoSeal™ VCS prokazují soulad mezi údaji týkajícími se hodnoceného prostředku (např. použití prostředku, výsledky týkající se bezpečnosti, klinická funkce a klinické přínosy), identifikovanými ekvivalentními prostředky a údaji souvisejícími s podobnými prostředky dle nejnovějšího vývoje.

Křížová analýza údajů o bezpečnosti neodhalila žádné nesrovnalosti mezi následujícími:

- Údaji uvedenými v analýze nejnovějšího vývoje
- Údaji specifickými pro hodnocený prostředek
- Údaji uvedenými v souboru/souborech řízení rizik

- Údaji uvedenými v označení a/nebo v návodu k použití (tj. jsou uvedena zbytková rizika, která mají být sdělena uživateli).

Klinická bezpečnost byla prokázána nízkými četnostmi komplikací zjištěnými v publikované recenzované klinické literatuře, v klinických studiích zadaných společnostmi, při přezkumu údajů po uvedení na trh a skutečností, že nedošlo k žádnému stažení z trhu. Nebyly zjištěny žádné obavy v souvislosti s klinickou funkcí, literatura hodnotila dlouhodobé použití prostředku FemoSeal™ VCS, které bylo v souladu s použitím určeným výrobcem.

### 1.5 Možné diagnostické nebo léčebné alternativy

K dosažení hemostázy v místě arteriotomie po cévní katetrizaci se tradičně používá manuální komprese. Manuální komprese je spojena s delší imobilizací pacienta (až 8 hodin po zákroku) a se značným nepohodlím a delším pobytem v nemocnici. V jednom nedávném systematickém přezkumu bylo zjištěno, že medián doby pro dosažení hemostázy s manuální kompresí je 20,8 minuty.<sup>1</sup>

K alternativám manuální komprese patří externí hemostatické prostředky, které v místě arteriotomie aplikují mechanickou kompresi. Tyto prostředky nezkracují dobu do dosažení hemostázy ani dobu do mobilizace pacienta, ale snižují nároky na personál nahrazením manuální komprese mechanickou kompresí. Míra nežádoucích příhod spojených s použitím mechanické komprese je podobná jako u manuální komprese.

Prostředky na uzavírání cév, jako je systém FemoSeal™ VCS, jsou určeny k uzavírání arteriotomie. Jejich účelem je zkrácení doby do dosažení hemostázy a umožnění dřívější mobilizace pacienta. V jednom nedávném systematickém přezkumu zaměřeném na 13 komerčně dostupných prostředků bylo zjištěno, že medián doby do dosažení hemostázy s prostředkem na uzavírání cév je 5,4 minut. Medián doby do dosažení hemostázy se u jednotlivých prostředků na uzavírání cév pohyboval v rozmezí od 1 minuty (systém FemoSeal™ VCS) do 14 minut, přičemž většina prostředků se pohybovala mezi 4 a 10 minutami.<sup>1</sup>

Mezi běžně hlášené nežádoucí příhody spojené s uzavřením místa arteriotomie, s manuální kompresí, externími hemostatickými prostředky nebo prostředky na uzavírání cév patří hematoma, krvácení v místě přístupu, pseudoaneuryzma, arteriovenózní píštěl a infekce. Ve stejném systematickém přezkumu (34 randomizovaných kontrolovaných studií, 14 401 pacientů) bylo zjištěno, že míra nežádoucích účinků byla u manuální komprese a při použití prostředků na uzavírání cév podobná, s výjimkou toho, že krvácení bylo při použití prostředků na uzavírání cév o něco vyšší.<sup>1</sup>

## 1.6 Doporučený profil uživatele a školení uživatele

Určenými uživateli systému FemoSeal™ Vascular Closure System jsou lékaři, kteří jsou vyškoleni v oblasti vytváření a uzavírání arteriálního přístupu k provádění endovaskulárních výkonů přes společnou femorální tepnu a absolvovali školicí program pro lékaře o prostředku FemoSeal™ společnosti Terumo Medical Corporation.

Formålet med dette resumé af sikkerhed og klinisk ydelse (SSCP) er at give offentlig adgang til et opdateret resumé af de vigtigste aspekter af sikkerhed og kliniske ydelse for FemoSeal™ Vascular Closure System (VCS).

**Afsnit 1.0** nedenfor indeholder et resumé af anordningens sikkerhed og kliniske ydeevne, beregnet til brugere/sundhedspersoner.

## **1.0 RESUMÉ TIL BRUGERE/SUNDHEDSPERSONALE**

SSCP'et er ikke beregnet til at erstatte brugsanvisningen som hoveddokument for at garantere sikker brug af enheden, og det er heller ikke beregnet til at give diagnostiske eller terapeutiske forslag til tilsigtede brugere eller patienter. SSCP'en er ikke beregnet til at erstatte de obligatoriske oplysninger på implantatkortene eller i andre obligatoriske dokumenter.

### **1.1 Tilsigtet brug af udstyret**

#### **1.1.1 Tilsigtet brug**

FemoSeal™ Vascular Closure System er en medicinsk anordning, der er beregnet til at lukke en arteriepunktur efter perkutan kateterisering gennem femoralarterien.

#### **1.1.2 Indikationer for brug**

FemoSeal™ Vascular Closure System er indiceret til lukning af en punktur af femoralarterien (arteriotomi) hos patienter, som har fået foretaget en perkutan kateterisation ved hjælp af et 7F (2,33 mm) eller mindre indføringshylster.

#### **1.1.3 Kontraindikationer og/eller begrænsninger**

FemoSeal™ Vascular Closure System er kontraindiceret til patienter med arteriotomier, hvor der er anvendt indføringshylstre eller anordninger større end 7F (2,33 mm).

#### **1.1.4 Tilsigtede patientpopulationer**

Sikkerheden og effektiviteten af FemoSeal™ Vascular Closure System er blevet fastslået hos patienter på 18 år og derover, som har fået foretaget perkutan kateterisation med et 7F (2,33 mm) eller mindre indføringshylster.

#### **1.1.5 Særlige patientpopulationer**

Sikkerhed og effektivitet af FemoSeal™ Vascular Closure System er ikke blevet fastslået hos følgende patientpopulationer:

- Patienter med eksisterende autoimmun sygdom.
- Patienter, der gennemgår terapeutisk trombolyse.
- Patienter med klinisk signifikant perifer vaskulær sygdom.
- Patienter med ukontrolleret hypertension (> 220 mmHg systolisk eller > 110 mmHg diastolisk).
- Patienter med blødningsforstyrrelser, herunder trombocytopeni (< 100.000 trombocytter/l) eller anæmi (Hgb < 10 mg/dl).

- Patienter med en indvendig lumen i femoralarterien, der er mindre end 5 mm.
- Patienter med nedsat nyre- og/eller leverfunktion.
- Patienter med anden relevant komorbiditet.
- Population med specifik racemæssig og/eller etnisk oprindelse.
- Patienter med myokardieinfarkt inden for 72 timer.
- Patienter med et vaskulært transplantat eller en stent på punkturstedet.
- Gravide eller ammende patienter.
- Patienter under 18 år.

### 1.1.6 Tilsigtede brugere

De tilsigtede brugere af FemoSeal™ Vascular Closure System er læger med en uddannelse, der kvalificerer dem til at udføre arteriel adgang og lukning i forbindelse med endovaskulære procedurer gennem femoralarterien, og som har deltaget i et Terumo Medical Corporations FemoSeal™ lægevejledningsprogram.

## 1.2 Produktbeskrivelse

### 1.2.1 Beskrivelse af produktet

FemoSeal™ Vascular Closure System, der er fremstillet af Terumo Medical Corporation (TMC), er en resorberbar vaskulær lukkeanordning, der er designet til at opnå femoral arteriel hæmostase efter perkutan kateterisering gennem femoralarterien.

FemoSeal™ lukkeelementer består af to resorberbare polymerskiver, den indvendige forsegling og den udvendige låseskive, som holdes sammen af et resorberbart multifilament, hvorved arteriotomien forsegles mekanisk (se **figur 1.1** og **figur 1.2**). Når den udvendige låseskive er anlagt via indføringssheathet, trykkes den fast på multifilamentskafte, hvilket resulterer i mekanisk lukning af punkturstedet mellem den indvendige og udvendige låseskive. Den indvendige forsegling og den udvendige låseskive holdes på plads via friktion på multifilamentakslen. Hæmostase opnås mekanisk. Lukkeelementerne nedbrydes ved hydrolyse.

De implanterbare lukkekomponenter, den indvendige forsegling og den udvendige låseskive nedbrydes i løbet af atten (18) måneder, mens multifilamentet skønnes at være nedbrudt og absorberet ved hydrolyse af det omgivende væv efter to (2) til tre (3) år. De implanterbare lukkekomponenters evne til at opretholde kompression på arteriotomien er blevet testet i op til otte (8) timer. Nedbrydningsprodukterne metaboliseres og udskilles i urinen eller udskilles som kuldioxid via lungerne. Der er ikke observeret nogen akkumulerende virkninger i dyreforsøg. De

andre FemoSeal™-komponenter, der kommer i kontakt med levende væv eller blod under indgrebet, er indføringssheath, dilatator, stamper, skubber og guidewire.

**Figur 1.1** Henholdsvis indvendig forsegling og udvendig låseskive

**Figur 1.2** Indvendig forsegling og udvendig låseskive anbragt

FemoSeal™-enheden er pakket sammen med en dilatator og en guidewire med en ydre diameter på 0,038" (0,97 mm) og en længde på 27,5" (70 cm) samt en J-spids, se **figur 1.3** nedenfor. Guidewiren er indkapslet i et polyethylenrør. Alle dele er pakket i en fast papirbakke. Pakningen indeholder desuden patientens implantatkort. FemoSeal™ Vascular Closure System kræver ikke yderligere tilbehør, for at enheden kan fungere efter hensigten, og enheden er kun beregnet til brug med dilatatorens og guidewiren, der er inkluderet i produktets emballage.

**Figur 1.3 FemoSeal™ Vascular Closure System med guidewire og dilatator**

**1.2.2 Råmaterialer og komponenter**

Tabel 1.1 nedenfor viser komponenterne i FemoSeal™ VCS.

**Tabel 1.1 FemoSeal™ VCS Råmaterialer og komponenter**

\* Implanterbar del af anordningen; implanterbare komponenter er MR-sikre

FemoSeal™ VCS er steriliseret med ethylenoxid (EO) og er medicinsk udstyr til engangsbrug. FemoSeal™ VCS-enheden er konstrueret på en sådan måde, at den ikke kan genbruges.

### **Virkningsmekanisme**

FemoSeal™ Vascular Closure System fremmer mekanisk hæmostase ved at anbringe implanterbare lukkeelementer inde i og uden for femoralarterien. Mekanismen, der forebygger blødning, leveres af den indvendige forsegling, som forsegler punkturstedet, og den udvendige låseskive, der holder den indvendige forsegling på plads.

#### **1.2.3 Klinisk fordel**

FemoSeal™ Vascular Closure System giver følgende kliniske fordele i forhold til lukning af blodkar efter punktur af femoralarterien:

- Reduceret tid indtil hæmostase <sup>1</sup>
- Reduceret tid indtil patienten er mobil <sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Tidligere generation(er) eller varianter

- Den første version af FemoSeal™ Vascular Closure System (#11200) blev solgt på det europæiske marked i 2005 og en del af 2006.
- Det nuværende FemoSeal™ Vascular Closure System (#11202) med et forbedret applikationssystem har været på markedet siden 28. marts 2006.

#### 1.2.5 Tilbehør, der er beregnet til brug sammen med anordningen

FemoSeal™-enheden er pakket sammen med en dilatator, en guidewire med en ydre diameter på 0,038" (0,97 mm), en længde på 27,5" (70 cm) og en J-spids. Guidewiren er tilbehør til FemoSeal™-enheden. J-spidsen er en komponent til guidewiren, mens dilatatoren er en komponent til FemoSeal™-enheden. Guidewiren er det eneste, der regnes som tilbehør. Guidewiren er indkapslet i et polyethylenrør. Alle dele er pakket i en fast papirbakke. Pakningen indeholder desuden patientens implantatkort. FemoSeal™ Vascular Closure System kræver ikke yderligere tilbehør, for at enheden kan fungere efter hensigten, og enheden er kun beregnet til brug med dilatatoren og guidewiren, der er inkluderet i produktets emballage.

#### 1.2.6 Andre anordninger og produkter, der er beregnet til at blive brugt i kombination med udstyret

FemoSeal™ Vascular Closure System kræver ikke yderligere udstyr for at fungere efter hensigten.

### 1.3 Risici og advarsler

#### 1.3.1 Resterende risici og bivirkninger

Kendte eller forudsigelige utilsigtede hændelser, skader og komplikationer i forbindelse med brug af FemoSeal™ VCS som følge af resterende risici er anført i **tabel 1.2**.

Forekomsthypigheden er baseret på en analyse af risikodokumentationen og beregnet på baggrund af data fra overvågning efter markedsføringen fra 1. September 2019 til og med 31. August 2024. Der er ingen ukendte resterende risici for FemoSeal™ VCS, og alle relevante risici er blevet håndteret gennem brugsanvisningen og risikostyringsprocessen.

**Tabel 1.2. FemoSeal utilsigtede hændelser/komplikationer**

| Skade                                     | Incidenshyppighed (%) | Afbødende faktorer                                                                                                                                                         |

### 1.3.2 Advarsler og forholdsregler

#### Advarsler

1. Må ikke anvendes, hvis emballagen er beskadiget, eller en steril barriere ikke er intakt.
2. Må ikke anvendes efter udløbsdatoen – de biologisk nedbrydelige komponenter fungerer muligvis ikke korrekt.
3. Må ikke anvendes, hvis nogen af delene ser ud til at være beskadigede eller defekte på nogen måde.
4. Brug af FemoSeal™ Vascular Closure System, hvor der kan være opstået bakteriel kontaminering af indføringssheathet eller det omgivende væv, kan forårsage infektion.
5. Hvis der er mistanke om, at den posteriore arterievæg er punkteret, eller der er foretaget mere end én arteriepunktur, må man ikke udelukkende stole på, at FemoSeal™ Vascular Closure System kan give arteriel hæmostase. Brug yderligere manuel eller mekanisk kompression.
6. Hvis punkturstedet er i eller distalt for femoralisarteriens bifurkation, må FemoSeal™ Vascular Closure System ikke anvendes, da der er risiko for, at den indvendige forsegling kan blive anbragt forkert. Denne hændelse kan medføre blødningskomplikationer og/eller afbrydelse af den normale blodgennemstrømning.
7. Hvis der er vedvarende arteriel blødning fra incisionsstedet, må multifilamentet ikke klippes, før der er opnået hæmostase. Hvis der ikke opnås hæmostase, skal multifilamentet fastgøres med en steril sårbandage, og der skal anvendes supplerende kompression, indtil der opnås hæmostase. I tilfælde af vedvarende arteriel blødning kan der opstå signifikante blødningskomplikationer, som kan resultere i skade på patienten, eller at denne dør.
8. FemoSeal™ Vascular Closure System må ikke anvendes, hvis punkturstedet er proksimalt for det ingvinale ligament, da dette kan resultere i et retroperitonealt hæmatom.
9. Patienter med en højere risiko for blødning kan opleve øget blodtab, hvilket kræver transfusion.
10. Hvis den indvendige skive løsner sig, kan det potentielt forårsage en trombotisk og/eller embolisk hændelse.

#### Forholdsregler

1. FemoSeal™ Vascular Closure System skal anlægges af læger med tilstrækkelig uddannelse i brugen af anordningen.

2. Der skal udføres et begrænset femoralt angiogram eller en ultralydsvejledt punktur af femoralarterien inden anlæggelse af FemoSeal™ Vascular Closure System.
3. Afbryd proceduren, hvis:
  - Lumendiameter af femoralarterien < 5 mm.
  - Stenose og/eller betydelig plaque i området omkring punkturstedet ved femoralarterien.
  - Arteriepunktur er ved eller distalt for bifurkationen af femoralarterien.
  - Der er abnorme grene eller karabnormiteter i området omkring punkturstedet ved femoralarterien.
4. Hvis der er hæmatomer til stede, skal der udvises ekstra forsigtighed for at sikre korrekt indføring af indføringssheathet i arterien.
5. Brug en punkturteknik, der gennembryder én væg. Arteriens bageste væg må ikke punkteres.
6. Følg altid steril teknik ved brug af FemoSeal™ Vascular Closure System.
7. FemoSeal™ Vascular Closure System er kun til engangsbrug og må ikke resteriliseres eller genanvendes på nogen måde. FemoSeal™-enheden er konstrueret således, at den ikke kan genanvendes.
8. Afbryd proceduren, hvis placeringen af den indvendige forsegling møder uventet modstand.
9. For korrekt placering af den indvendige forsegling skal tommelfingeren flyttes, så knappen frit kan springe tilbage.
10. Sørg for, at spidsen af FemoSeal™-anordningens indføringssheath er under hudens overflade, inden den udvendige låseskive placeres. Den udvendige låseskive kan uforvarende blive anbragt over hudniveau hos patienter, der har kort afstand mellem femoralarterien og hudniveauet.
11. Det kan være nødvendigt med en hudincision før anlæggelse for at opnå en korrekt placering.
12. Hvis den indvendige forsegling er inde i arterien, men det ikke kan lade sig gøre at trykke knappen helt ned og anbringe den udvendige låseskive, kan det være nødvendigt med et kirurgisk indgreb for at fjerne FemoSeal™ lukkeelementerne.
13. Hvis det bliver nødvendigt at foretage en ny punktur af den samme femoralarterie inden for 18 måneder, skal den nye punktur foretages mindst én centimeter proksimalt for det tidligere punktursted for FemoSeal™ Vascular Closure System.

14. Instruer patienten i at følge lægens anvisninger vedrørende inspektion af lukningsstedet.

15. Bed patienten om at have patientinformationskortet på sig i de næste 18 måneder

### **Forholdsregler ved udskrivning**

Inden udskrivning overvejes, skal patienten vurderes for følgende kliniske tilstande:

1. Blødning og/eller hæmatom ved lukningsstedet.
2. Smerter ved gang.
3. Tegn på infektion ved lukningsstedet.

### **1.3.3 Sikkerhedsrelaterede korrigerende handlinger**

Der var én sikkerhedsrelateret korrigerende handling, der involverede FemoSeal™ VCS, i perioden fra 1. september 2019 til og med 31. august 2024.

I 2022 tilbagekaldte Terumo frivilligt FemoSeal™ VCS på grund af klager over fejl i proces- og batchfrigivelsestest af Elkton-producerede FemoSeal-produkter til måling af kompressionskraft og tilbagetrækningskraft. I alt blev 950 enheder tilbagekaldt fra Sydkorea.

## **1.4 Klinisk evaluering og klinisk opfølgning efter markedsføring**

**Tabel 1.3** indeholder en liste over pivotale forsøg, der er inkluderet med henblik på markedsføringen af FemoSeal™ VCS samt forsøg efter markedsføring og kliniske opfølgningsaktiviteter efter markedsføring. Den version af udstyret, der anvendes i forsøget, er inkluderet i tabellen nedenfor. Den første version af FemoSeal™ VCS (#11200) var på markedet indtil 2006, mens den næste version (#C11202) blev lanceret på markedet i 2006 og er den, der er på markedet i dag.

**Tabel 1.3 Oversigt over pivotale forsøg**

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vasculature System. Functional Implantation Test in Sheep 12-, 15-, and 18-month Time Periods. (R1051-1), 2000, Radi Medical System AB (performed by Biomatech, France). | 2000<br>Radi Medical System AB<br><br>Udført af Biomatech, France | Dyreforsøg; Eksplorativ undersøgelse | Formålet med forsøget var at vurdere biokompatibiliteten og biofunktionaliteten af et bionedbrydeligt implantat, designet til at opnå hæmostase i det vaskulære system. Rapporten omhandler reservedyr fra forsøg nr. 862 (dokumentnr. 1051-01) | N = 3 voksne hunfår, 1 dyr pr. tidspunkt<br><br>Opfølgning med henblik på histopatologisk analyse, makroskopisk klassifikation og ultrastrukturel analyse<br><br><ul style="list-style-type: none"> <li>12 mdr.</li> <li>15 mdr.</li> <li>18 mdr.</li> </ul><br>Farve-Doppler ultralydsopfølgning – 30 dage på adgangsstederne i halspulsåre og femoralarterie | Arteriel åbenhed <ul style="list-style-type: none"> <li>Vurdering af blodgennemstrømning efter anlæggelse – 2/3 reduktion af blodgennemstrømning i forbindelse med midlertidig arteriel vasospasme, som blev tilskrevet proceduren, begge forekom ved venstre femoralarterie</li> <li>Farve-Doppler ultralydsvurdering (4 uger) – 3/3 (100 %) uden større reduktion af blodgennemstrømning 30 dage efter implantation</li> </ul> |

|  |  |  |  |  | <p>Makroskopiske observationer</p> <ul style="list-style-type: none"> <li>12 måneder – åbenhed bekræftet makroskopisk ved fravær af anatomisk synlig okklusion; ingen makroskopiske lokale intolerancelæsioner (blødning, nekrose eller neovaskularisering); indkapsling af intern skive syntes at være markeret</li> <li>15 måneder – makroskopisk observation viste ingen tegn på inflammation; ingen rester af indvendige eller udvendige skiver identificeret; indkapslingsvæv i området for den udvendige skive så ud som ved observationen efter 12 måneder</li> <li>18 måneder – makroskopisk observation viste ingen tegn på lokal intolerance, udvendig skive synlig (3/3 tilfælde), nedbrydning af indvendig skive komplet; 1/3 (venstre halspulsåre) - depression af arterievæggen observeret ved implantationsstedet (kan være relateret til anbringelse af anordningen)</li> </ul> <p>Konklusion</p> <ul style="list-style-type: none"> <li>Makroskopisk blev der ikke påvist nekrotiske, degenerative eller trombotiske tegn 12, 15 og 18 måneder efter implantationen.</li> <li>Nedbrydningsprocessen af de indvendige og udvendige skiver syntes at avancere mellem 12 og 18 måneder og er helt sammenføjet efter 18 måneder med et hvidligt væv, der dækkede det implanterede område.</li> <li>Histologisk var polymermateriale ikke længere synligt efter 18 måneder, men endoluminalt fibrøst væv var til stede. Der blev ikke observeret nekrotiske, degenerative eller trombotiske læsioner.</li> </ul> |

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Udført af Biomatech, France | Dyreforsøg | Formålet med forsøget var at vurdere biokompatibiliteten og biofunktionaliteten af et bionedbrydeligt implantat, designet til at opnå hæmostase i det vaskulære system. Det afprøvede produkt var beregnet til at gå ind i punkturhullet i arterierne for at opnå hæmostase. Den ene skive kom ind i punkturhullet i arterien, og den anden strammede den indvendige skive fra ydersiden af arterien. Begge skiver blev indført gennem et introducersheath. Skiverne var designet til at forhindre blødning, til at hele ind i karvæggen og til sidst nedbrydes og absorberes. Forsøget var designet til at indsamle og analysere data efter funktionel implantation hos får og grise for at evaluere implantatets evne til at opretholde den fysiologiske funktion, når det anvendes i kredsløbssystemet, med henblik på at bestemme værtens respons og implantatets respons (fysisk integritet, vævsindkapsling ved okklusion) og for at evaluere nedbrydningen af implantatet | Implantationsperiode/opfølgning er 5 uger for alle dyr<br><br>4 får, 1 gris<br><br>14 lukkeelementer<br><br>8 lukkeelementer implanteret i 2 får,<br><br>2 lukkeelementer implanteret i 1 gris<br><br>Da to lukkeelementer blev implanteret i samme femoralarterie, blev de implanteret i en afstand > 30 mm | Alle kriterier for uønskede tegn (inflammation, nekrose, blødning eller enhver anden læsion) eller enhver form for tynd pseudo-intimal lagdannelse blev registreret. Der blev lagt særlig vægt på den indledende vævsintegration af anordningen med særlig vægt på den indvendige indkapsling af skiven.<br><br>Makroskopisk blev der ikke observeret nogen signifikante tegn på lokal intolerance eller trombedannelse. Den makroskopiske observation afslørede ingen forskel mellem fårene eller grisen efter implantation af lukkeelementerne i femoralarterien. Makroskopisk blev der ikke observeret nogen signifikante tegn på lokal intolerance eller trombedannelse. Den makroskopiske observation afslørede ingen forskel mellem fårene eller grisen efter implantation af lukkeelementerne i femoralarterien.<br><br>Den histopatologiske analyse af implantationsstedet hos får viste ingen lokale bivirkninger. De indvendige og udvendige skiver viste tegn på nedbrydning og var i nogle tilfælde nedbrudt i mindre dele. De indvendige skiver blev fuldstændig integreret i neointimalt væv. Hos grisen viste den histopatologiske analyse lidt flere inflammatoriske tegn |

Som en del af udviklingsplanen for FemoSeal™ VCS før markedsføring blev der gennemført 3 funktionelle dyreforsøg. I 2000, før der blev indledt kliniske forsøg, blev der udført et dyreforsøg for at vurdere biofunktionaliteten af FemoSeal™ VCS. I dette forsøg vurderedes lukkeelementernes evne til at opretholde den fysiologiske funktion og evaluere deres nedbrydning. Efter 18 måneder var det indvendige og udvendige skivemateriale ikke længere synligt, efter at det var blevet erstattet med endoluminalt fibrøst væv. Konkluderende blev det bekræftet, at FemoSeal™ VCS lukkeelementet kan opretholde den fysiologiske funktion, når det anvendes i kredsløbssystemet.

I 2002 blev der udført et dyreforsøg for at vurdere biokompatibiliteten og biofunktionaliteten af et bionedbrydeligt implantat, FemoSeal™ VCS, der er designet til at opnå hæmostase i det vaskulære system. Sammenfattende var nedbrydningen af implantatet næsten fuldstændig efter 36 uger, og der var ingen signifikant uønsket vævsreaktion.

Et andet dyreforsøg i 2002 vurderede biokompatibiliteten og biofunktionaliteten af et bionedbrydeligt implantat, FemoSeal™ VCS, der er designet til at opnå hæmostase i det vaskulære system. Efter 5 uger var indkapslingen af skiven komplet, og tegn på nedbrydning blev observeret for indvendige og udvendige skiver. Afslutningsvis blev implantatets evne til at opretholde den fysiologiske funktion, når det anvendes i kredsløbssystemet, bekræftet.

Som en del af den kliniske udviklingsplan for FemoSeal™ VCS gennemførte Radi Medical System AB en klinisk undersøgelse før markedsføringen. Denne kliniske undersøgelse er ikke publiceret eller tilgængelig online. Forsøget med model #11200 blev udført i 2002-2004 i henhold til den europæiske standard EN 540 (Clinical Investigation of Medical Devices for Human Subjects) og i overensstemmelse med ICH General Considerations for Clinical Trials and Guideline for Good Clinical Practice. Detaljerne i dette forsøg er dokumenteret i rapport EU-SE-001. Det kliniske forsøg blev dokumenteret i den endelige rapport fra Radi Medical Systems AB, "Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures". Det kliniske forsøg blev udført med FemoSeal™s første model #11200 og fokuserede på sikkerheden og effektiviteten af de implanterbare lukkekomponenter. Den eneste forskel på den første model nr. 11200 og den nuværende model, C11202, er størrelsen, henholdsvis 6F og 7F, og det forbedrede applikationssystem. De kliniske fordele, den tilsigtede anvendelse, anvendelsesprincipperne og råmaterialerne til de implanterbare lukkeelementer, den indvendige forsegling og den udvendige låseskive forbliver uændrede.

Den tilsigtede anvendelse af enheden var til patienter, der gennemgik hjertediagnostiske eller interventionelle kardiologiske procedurer, hvor femoralarterien blev brugt som adgangspunkt. Formålet med dette forsøg var at bestemme sikkerheden, ydeevnen og effektiviteten af FemoSeal™ VCS. Dette var et prospektivt, åbent enkeltarmet multicenterforsøg med 30 dages opfølgning.

Det primære effektendepunkt var tid til hæmostase defineret som fravær af kraftig blødning. Det primære sikkerhedsendepunkt var forekomsten af større vaskulære komplikationer inden for 30 dage. Sekundære endepunkter omfattede tiden indtil patienten kunne gå, andel af behandlingssvigt, forekomst af uønskede hændelser og karakteristika for enhedens ydeevne under applikation og placering.

De patienter, der deltog i dette forsøg, var voksne, der var i stand til at afgive informeret samtykke og med mindst én intakt fodpuls. Patienterne blev ekskluderet fra forsøget, hvis de havde en eller flere af følgende tilstande:

- Perifer vaskulær sygdom i anamnesen
- Autoimmun sygdom
- Kendt blødningslidelse med svær anæmi
- INR >1,5
- Myokardieinfarkt inden for 72 timer
- Ukontrolleret hypertension på trods af behandling
- Fedme, der udelukker adgang med Seldinger-teknik
- Tilstedeværelse af vaskulær graft eller stent på arteriotomistedet
- Tidligere ipsilateral punktur inden for 3 måneder
- Forventet levetid < 6 måneder

Derudover blev patienterne undersøgt intraoperativt og udelukket fra forsøget, hvis et eller flere af følgende blev observeret:

- Lumendiameter af femoralarterien < 5 mm
- Arteriegrene inden for 2 cm proksimalt for punkturstedet
- Signifikant stenose inden for 3 cm fra punkturstedet
- Anvendelse af originalt indføringshylster > 6Fr
- Punktur ved eller distalt for bifurkation af femoralarterien
- Flere punkturer i femoralarterien
- Kendt eller formodet punktur af bagvæg i femoralarterien
- Stort hæmatom (2:6 cm) ved afslutningen af proceduren
- Vanskelig indføring af originalt indføringshylster for proceduren på grund af snoet væv eller kar

Dette enkeltprotokolforsøg blev udført i to dele: 20 patienter blev inkluderet i Del 1, hvorefter der blev gennemført en sikkerhedsanalyse, og derefter blev der inkluderet yderligere 60 patienter i Del 2.

I Del 1 var gennemsnitsalderen for inkluderede patienter 65,9 år, 70,0 % af patienterne var mænd, og 95 % af patienterne fik samtidig medicin. I Del 2 var gennemsnitsalderen 63,8 år, 78 % var mænd, og 100 % fik samtidig medicin.

Patienter, der gennemgik diagnostiske (Del 1 og Del 2) eller interventionelle (Del 2) hjertekateteriseringer, var egnede til inklusion i forsøget. Procedurene var i overensstemmelse

med standardbehandlingen på hvert af de inkluderede hospitaler efterfulgt af brugen af FemoSeal™ VCS. Patientdata blev indsamlet ved baseline, under proceduren og 1 dag og 30 dage efter proceduren. Resultaterne er opsummeret i **Tabel 1.5** og viser, at FemoSeal™ VCS er sikker og effektiv til brug i denne patientpopulation.

**Tabel 1.5 Kliniske resultater rapporteret i forsøget før markedsføring**

|                                                                                                                 | Del 1         | Del 2                      |
|-----------------------------------------------------------------------------------------------------------------|---------------|----------------------------|
| Antal patienter                                                                                                 | 20            | 60                         |
| Gennemsnitlig tid til hæmostase                                                                                 | 1,2 minutter  | 1,6 minutter <sup>a</sup>  |
| Gennemsnitlig tid til patienten var mobil                                                                       | 72,2 minutter | 87,5 minutter <sup>b</sup> |
| Incidens af større vaskulære komplikationer <sup>c</sup>                                                        | 0 (0 %)       | 1 (2 %)                    |
| Antal patienter med uønskede hændelser                                                                          | 5 (25 %)      | 19 (32 %)                  |
| Behandlingssvigt (defineret som større vaskulære komplikationer, behov for manuel kompression eller begge dele) | 0 (0 %)       | 3 (5 %)                    |
| Funktionsfejl på udstyret                                                                                       | 0 (0 %)       | 6 (10 %)                   |

<sup>a</sup> Baseret på en samlet forsøgsstørrelse på 58, fordi 2 forsøgspersoner ikke opnåede hæmostase på tidspunktet for indgrebet på grund af tidligere ipsilaterale punkturer. Hæmostase blev opnået efter 7 minutter og 37 minutter for disse patienter.

<sup>b</sup> Baseret på en samlet prøvestørrelse på 59: 1 patient blev ikke inkluderet, fordi denne blev lagt i respirator på grund af et lungeødem og ikke kunne mobiliseres i over en uge.

<sup>c</sup> Defineret som en vaskulær komplikation, der kræver blodtransfusion eller operation, eller en lokal infektion, der kræver administration af antibiotika, indlæggelse eller forlængelse af indlæggelse eller debridement af stedet

Der blev ikke observeret større vaskulære komplikationer i Del 1 af forsøget. Der blev rapporteret om 1 større vaskulær komplikation i Del 2 af forsøget: en pseudoaneurisme, som blev rapporteret inden for 1 dag efter proceduren. Hændelsen krævede ultralydsvejledt kompression og en injektion af trombin i pseudoaneurismen og forlængede patientens indlæggelse.

Ud af de 5 uønskede hændelser, der blev rapporteret i Del 1 af forsøget, var der 1 mulig udstyrsrelateret bivirkning: en ikke-alvorlig hændelse med kraftig blødning 1 dag efter indgrebet. Ud af de 19 uønskede hændelser, der blev rapporteret i Del 2 af forsøget, blev der observeret 3 ikke-alvorlige, udstyrsrelaterede, uønskede hændelser med et hæmatom, og der blev observeret 6

mulige, udstyrsrelaterede, ikke-alvorlige, uønskede hændelser, herunder 3 rapporter om vedvarende udsivning, 2 hæmatomer og smerter i 1 ben efter motion.

3 patienter i Del 2 blev betragtet som behandlingssvigt: 2 på grund af manglende opnåelse af hæmostase uden brug af kompression og 1 på grund af den større vaskulære komplikation (pseudoaneurisme). Der var ingen behandlingssvigt i Del 1 af forsøget.

Ud af de seks svigt i forsøgets Del 2 forstyrrede tre ikke proceduren, den ene skyldtes en brugerfejl, den anden var lækage fra indføringshylsteret og én var et knækket filamentled. De to sidste problemer blev håndteret ved hjælp af modelopdateringer implementeret i C11202.

Del 2 af det kliniske forsøg før markedsføring rapporterede ikke de opfølgende resultater efter 6 måneder på grund af manglende patientkomplians. Det kliniske forsøg før markedsføring (EU-SE-001) med 30 dages resultater, som er i overensstemmelse med den kliniske litteraturs opfølgningsperiode, viser, at FemoSeal™ VCS er sikker og effektiv.

#### 1.4.2 Resumé af data fra kliniske forsøg efter markedsføring

Der er udført 4 kliniske forsøg efter markedsføring, som er beskrevet i **tabel 1.6** nedenfor. Disse kliniske undersøgelser er ikke publiceret eller tilgængelige online.

**Tabel 1.6 Gennemførte kliniske forsøg efter markedsføring**

|--|--|--|--|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

2006-forsøget blev udført for at bekræfte sikkerheden og effektiviteten af det aktuelle udstyr med et forbedret applikationssystem og for at få feedback på FemoSeal™ VCS-brugsanvisning og -uddannelsesprogram. Forsøget omfattede 100 patienter, og det primære endepunkt var, om der blev opnået hæmostase, eller om der var behov for yderligere manuelle eller mekaniske kompressioner. Forsøget konkluderede, at anvendelsen af FemoSeal™ VCS var vellykket i flertallet af tilfældene (91 % opnåede øjeblikkelig hæmostase).

2008-forsøget inkluderede 50 patienter for at vurdere sikkerheden og ydeevnen af FemoSeal™ VCS ved brug af normal klinisk praksis hos patienter, der fik foretaget hjertekateterisering med et 7 F-indføringssheath. Det primære endepunkt for forsøget var at indsamle data om tiden til hæmostase og tiden til, at patienten var mobil uden yderligere kompression, manuelt eller mekanisk. Studiets resultater konkluderede, at middeltiden til hæmostase var 57,8 sekunder, og at alle patienter var mobile efter 4 timers sengeleje.

2009-forsøget skulle evaluere den nye FemoSeal™ VCS-emballage. 25 patienter blev inkluderet i forsøget. Det primære endepunkt var, om brugeren havde problemer med emballagen. Brugerne bemærkede ingen problemer med den nye FemoSeal™ VCS-emballage. Dette forsøg indsamlede også data for tiden til hæmostase.

2022-forsøget skulle proaktivt indsamle data om sikkerheden og effektiviteten af FemoSeal VCS med hensyn til at opnå hæmostase gennem adgang via femoralartieren (CFA) hos virkelige forsøgsdeltagere, der gennemgår perkutane endovaskulære procedurer. 230 patienter blev inkluderet i forsøget. De primære endepunkter for registeret er et vellykket forløb (dvs. vellykket hæmostase på punkturstedet) og færre alvorlige komplikationer (f.eks. vaskulær skade, blødning relateret til adgangsstedet, infektion på adgangsstedet, gentagen manuel kompression og ny ipsilateral akut beniskæmi, der er relateret til adgangsstedet). Forsøget konkluderede, at FemoSeal™ VCS fungerer godt i virkelige omgivelser og giver effektiv hæmostase og lave forekomster af komplikationer ved adgangsstedet for patienter, der gennemgår perifere endovaskulære indgreb. Det udviser god ydeevne med kort tid til hæmostase og god feedback fra operatøren om brugervenlighed, hvilket gør FemoSeal™ VCS til en værdifuld anordning til lukning af femoral adgang.

### 1.4.3 Resumé af data fra kliniske forsøg efter markedsføring

#### 1.4.3.1 Gennemført klinisk opfølgning efter markedsføring

Et resumé af de gennemførte kliniske opfølgningsaktiviteter efter markedsføring er beskrevet i **tabel 1.7** nedenfor.

**Tabel 1.7. Kliniske opfølgningsaktiviteter efter markedsføring**

Terumo Medical Corporation har gennemført tre kvalitetsundersøgelser hos læger i løbet af den aktuelle rapporteringsperiode (01. september 2019 til 31. august 2024).

FemoSeal™ kliniske undersøgelser indsamlede proaktive kliniske data i forhold til sikkerheden og ydeevnen af FemoSeal™ VCS i forbindelse med klinisk brug. Undersøgelsen omfattede spørgsmål, der fokuserede på det samlede udstyr og tilhørende tilbehør, herunder guidewiren på 0,038", og deres direkte interaktioner. De kliniske undersøgelser af guidewiren indsamlede proaktive kliniske data vedrørende sikkerhed og ydeevne i forbindelse med klinisk brug af den 0,038" guidewire, der blev leveret med FemoSeal™ VCS. Spørgsmålene i undersøgelsen fokuserede specifikt på den generelle brug af guidewiren, lige fra indføring gennem indføringsheathet og ind i vaskulaturen til fjernelse af guidewiren.

FemoSeal™ VCS og den 0,038" guidewire, som fulgte med anordningen, fik alle acceptable bedømmelser. Der blev indgivet seks (6) klager over anordningen og ni (9) klager over guidewiren baseret på evaluering af kommentarerne fra de kliniske undersøgelser af høj kvalitet. Klagerne er blevet evalueret for både FemoSeal og guidewiren og blev vurderet som en del af Terumos overvågningsproces efter markedsføring. Der blev ikke identificeret nogen nye risici eller risikoniveauer.

Der blev gennemført en brugerundersøgelse hos læger i 2024 som en del af PMCF-aktiviteterne. Resultaterne af undersøgelsen viste, at FemoSeal™ VCS' ydeevne og sikkerhed generelt var meget gunstige. Kompatibiliteten af andre guidewirer end den standard, der leveres med FemoSeal™ VCS, blev også påvist.

### 1.4.3.2 Igangværende/planlagt klinisk opfølgning efter markedsføring

TMC har én igangværende/planlagt klinisk opfølgningsaktivitet efter markedsføring. Der vil blive gennemført en klinisk spørgeundersøgelse med henblik på prospektivt at indsamle feedback relateret til brugen af guidewiren med FemoSeal VCS distribueret på EU-markedet. Spørgeskemaet udfyldes af læger med henblik på at undersøge, hvilke guidewirer de brugte under proceduren. Formålet med denne undersøgelse er at adressere et hul, der er identificeret som mangel på litteratur og kommentarer fra eksterne reviewere om FemoSeal™ VCS' kompatibilitet med brugen af andre guidewirer fra ikke-Terumo-mærker. Feedback omfatter tekniske resultater, klinisk ydeevne og sikkerhed i forbindelse med anordningens ydeevne med forskellige guidewirer.

#### 1.4.4 Sammenfatning af data fra systematisk litteraturgennemgang

Terumo Medical Corporation gennemfører systematiske litteraturgennemgange for at indsamle og evaluere kliniske sikkerheds- og ydeevnedata fra offentliggjorte forsøg med FemoSeal™ VCS og/eller lignende udstyr. Formålet med den årlige screening af den offentliggjorte litteratur er at identificere tidligere ukendte bivirkninger, overvåge kendte bivirkninger, identificere nye risici og identificere muligt systematisk misbrug eller off-label brug af FemoSeal™ VCS.

Den seneste systematiske litteraturgennemgang, som omfattede perioden fra 1. september 2019 til og med 31. august 2024, identificerede 29 offentliggjorte forsøg, som gav kliniske sikkerheds- og ydeevnedata om FemoSeal™ VCS. Der var 23 referencer, der rapporterede om on-label brug af FemoSeal™ VCS, og off-label brug blev rapporteret i ni studier. Samlet set viser litteraturgennemgangen af forsøg, der specifikt omhandler brugen af FemoSeal™ VCS, en forsøgspopulation, som er repræsentativ for patienter i EU, der gennemgår perkutane vaskulære kateteriseringsprocedurer. Se **afsnit 3** for en liste over disse 23 on-label, fagfællebedømte publikationer.

Den kliniske ydeevne blev vurderet ved hjælp af følgende målinger:

- Tiden til hæmostase er bedre end eller sammenlignelig med den nyeste teknologi for almindelig perkutan lukning af femoralarterien.
- Tiden til mobilisering er bedre end eller sammenlignelig med den nyeste teknologi til perkutan lukning af femoralarterien.
- Hyppigheden af postoperative komplikationer er sammenlignelig eller lavere end den aktuelle behandlingsstandard.

På baggrund af disse kliniske præstationsmål viste dataene i denne litteraturgennemgang, at FemoSeal™ VCS med succes kan anvendes til at lukke punktur af femoralarterien (arteriotomi) hos patienter, som har fået foretaget perkutan kateterisation ved hjælp af et 7 Fr eller mindre indføringshylster. Komplet hæmostase blev opnået hos størstedelen af patienterne (79,65-100 %) og var forbundet med en mediantid til hæmostase på 0,5 min., gennemsnitlig tid til udskrivelse var 3 dage. Mellem 69,2-86,7 % af patienterne var i stand til at gå 5 timer efter lukning med en gennemsnitlig postoperativ sengeleje på 349 min. Der blev observeret svigt af FemoSeal™ VCS i 3,68-4 % af tilfældene, og yderligere manuel kompression var nødvendig i 0,9-4,4 % af procedurerne.

Klinisk sikkerhed blev vurderet ved uønskede hændelser, herunder, men ikke begrænset til:

- Blødning
- Hæmatom
- Pseudoaneurisme
- Blå mærker

- Arteriovenøs fistel
- Infektion
- Død

For hver af disse uønskede hændelser var den rapporterede incidensrate for FemoSeal™ VCS i de inkluderede studier mindre end eller svarende til tidligere rapporterede forekomster for manuelle kompressionsanordninger og andre vaskulære lukkeanordninger.

Der blev ikke identificeret nogen uønskede hændelser ved gennemgang af 10 case-rapporter, da der ikke blev identificeret nogen nye, uventede, opståede eller uacceptable risici.

Den overordnede effektivitet ved brug af FemoSeal™ VCS under diagnostisk angiografi eller interventionelle operationer afhænger af flere faktorer som f.eks. køn, alder, patientens anatomi, komorbiditeter, anatomisk placering af punkturstedet, kirurgens erfaring, VCD-anlæggelsesmetode, postoperativ pleje, osv. Ud over teknisk succes, herunder opnåelse af hæmostase, gav FemoSeal™ VCS kliniske fordele i forhold til vaskulær lukning efter punktering af femoralarterien, såsom reduktion af tiden til hæmostase og reduktion af tiden til mobilisering. Ydeevneresultaterne for FemoSeal™ VCS er i overensstemmelse med dem, der forventes for denne type anordning, når den anvendes som tilsigtet. Nogle af de referencer, der blev indhentet i løbet af den aktuelle søgeperiode, viste anvendelse af forsøgsproduktet på et andet anatomisk sted end femoralarterien og til lukning af arteriotomier > 7 Fr, hvilket betragtes som off-label.

Der blev ikke identificeret ukendte bivirkninger, nye risici eller mulig systematisk misbrug af anordningen under gennemgangen. Hvis FemoSeal™ VCS imidlertid anvendes med forsigtighed af uddannede læger, fungerer det medicinske udstyr som et nyttigt og nødvendigt klinisk udstyr. Samlet set imødekommer målbehandlingen og dermed FemoSeal™ VCS det kliniske behov, der i øjeblikket eksisterer ved behandling af komplikationer relateret til vaskulær adgang.

Samlet set viste dataene i denne litteraturgennemgang ingen præstations- eller sikkerhedsmæssige problemer i forbindelse med kliniske forsøg, som ikke tidligere var kendt, eller negative effekter, som forekom med højere hyppighed end forudset/acceptabelt. Det kan derfor ud fra denne litteraturgennemgang konkluderes, at FemoSeal™ VCS, når systemet anvendes til at give kompression med henblik på hæmostase ved arteriotomien efter perkutan kateterisering, fortsat fungerer som forventet og ikke er forbundet med alvorlige sikkerhedshændelser.

#### **1.4.5 Resumé af data fra overvågning efter markedsføring**

Et proaktivt PMS-system er på plads, og en gennemgang af alle klager gennemføres månedligt og i overensstemmelse med interne produktionsprocedurer. Reklamationsdata blev analyseret i perioden 1. september 2019 til 31. august 2024. Overordnet set var der 28 indberetninger om overvågning af medicinsk udstyr (MDV) og 476 indberetninger om kundereklamationer til producenten. Af de 28 MDV-rapporter var 27 relateret til uønskede hændelser og en til funktionsfejl i anordningen. Der var to dødsfald i rapporteringsperioden, men ingen af de rapporterede dødsfald blev vurderet at være relateret til forsøgsproduktet. Blandt de 476

reklamationer, der blev indgivet til producenten, var de hyppigste årsager til reklamationerne vanskeligheder ved anlæggelse (146 tilfælde, 0,0142 % forekomsthypighed). Fejltilstand for udtrækningshændelser er den næstmest almindelige med en frekvens på 0,0126 % (130 hændelser).

FemoSeal Vascular Closure System har over 1.030.136 salg globalt og 827.843 i Det Europæiske Økonomiske Samarbejdsområde. Den beregnede reklamationshypighed baseret på globalt salg er 0,046 %. Den samlede procent af kundeklager er meget lav. Der blev ikke identificeret nye risici, som ikke er inkluderet i brugsanvisningen og risikodokumentationen.

Incidensrater for bivirkninger er vist i **tabel 1.2**. Der blev ikke identificeret nogen nye uventede, opståede eller uacceptable risici i forbindelse med reklamationerne. Der var ingen signifikante stigninger i hypigheden eller sværhedsgraden af kendte bivirkninger.

#### 1.4.6 Samlet resumé af klinisk ydeevne og sikkerhed

FemoSeal™ VCS er indiceret til brug ved lukning af punkturen af femoralarterien (arteriotomi) hos patienter, som har fået foretaget perkutan kateterisation ved hjælp af et 7F (2,33 mm) eller mindre indføringshylster. Denne kliniske evaluering er baseret på en omfattende analyse af tilgængelige kliniske data og litteratur før og efter markedsføring, der er relevante for den tilsigtede brug af FemoSeal™ VCS.

Der er foretaget en omfattende gennemgang af den offentliggjorte litteratur i perioden fra 1. september 2019 til og med 31. august 2024. Evidensen omfattede 29 forsøg med FemoSeal™ VCS. Den evidens, der er fremlagt i den kliniske evaluering, konkluderer, at forsøgsproduktet, når det anvendes som indiceret, er sikkert og effektivt, og at eventuelle risici eller uønskede bivirkninger, der kan være forbundet med produktet under normale brugsforhold, udgør acceptable risici og opvejes af fordelene for patienten. Ydeevneresultaterne for forsøgspersonernes anordninger er i overensstemmelse med dem, der forventes for denne type anordning, når den anvendes som tilsigtet.

De potentielle bivirkninger, der er forbundet med brugen af FemoSeal™ VCS, omfatter de bivirkninger, der almindeligvis rapporteres med alternative metoder til lukning af arteriotomi, f.eks. blødning og hæmatom. Samlet set svarer incidensraten for de bivirkninger, der er indberettet ved brug af FemoSeal™ VCS, til dem, der er indberettet ved manuel kompression og lignende vaskulære lukkeanordninger. Specifikt for blødning og hæmatom er den rapporterede hypighed for FemoSeal™ VCS mindre end den rapporterede hypighed for lignende vaskulære lukkeanordninger. Hver enkelt af de rapporterede uønskede hændelser, både fra den offentliggjorte litteratur og fra overvågningen efter markedsføringen, var tidligere blevet identificeret (se **afsnit 1.3**).

De eksisterende data vedrørende den kliniske sikkerhed og ydeevne for FemoSeal VCS tyder på, at patientfordelene ved brug af denne vaskulære lukkeanordning opvejer mulige risici, når den anvendes i overensstemmelse med brugsanvisningen.

Som angivet i de foregående afsnit ovenfor viser dataene for FemoSeal™ VCS overensstemmelsen mellem de data, der er relateret til den enhed, der evalueres (f.eks. brug af udstyret, sikkerhedsudfald, klinisk ydeevne og kliniske fordele), identificerede ækvivalente anordninger og de data, der er relateret til lignende anordninger, der er anført med den nyeste teknologi.

Krydsanalysen af sikkerhedsdata identificerede ingen huller mellem følgende:

- Data, der er omtalt i den nyeste teknologi
- Data, der er specifikke for det udstyr, der evalueres
- Data, der er nævnt i risikostyringsfil(er)
- Data, der er nævnt i mærkningen og/eller brugsanvisningen (dvs. resterende risici, der skal overføres til brugeren, behandles).

Den kliniske sikkerhed er blevet påvist ved lave komplikationsrater, der er identificeret i den offentliggjorte fagfællebedømte kliniske litteratur, virksomhedssponsorerede kliniske forsøg, gennemgang af data efter markedsføring sammenkoblet med ingen tilbagetrækninger fra markedet. Der er ikke identificeret nogen fejl med hensyn til funktionen. Den gennemgæede litteratur beskrev anvendelse af FemoSeal™ VCS, som var i overensstemmelse med producentens tilsigtede brug.

## **1.5 Mulige diagnostiske eller terapeutiske alternativer**

Manuel kompression anvendes traditionelt til at opnå hæmostase på arteriotomistedet efter vaskulære kateterisationer. Manuel kompression er blevet forbundet med immobilisering af patienten i længere perioder (op til 8 timer efter en procedure) og med betydeligt ubehag og forlængede hospitalsophold. En nylig systematisk gennemgang viste, at mediantiden til opnåelse af hæmostase med manuel kompression var 20,8 minutter.<sup>1</sup>

Alternativer til manuel kompression omfatter eksterne hæmostatiske anordninger, der påfører mekanisk kompression på arteriotomistedet. Disse anordninger forkorter ikke tiden til hæmostase eller tiden til, at patienten er mobil, men reducerer kravene til personalet ved at erstatte manuel kompression med mekanisk kompression. Hyppigheden af uønskede hændelser i forbindelse med brug af mekanisk kompression svarer til hyppigheden med manuel kompression.

Vaskulære lukkeanordninger, såsom FemoSeal™ VCS, er designet til at lukke arteriotomien. De har til formål at reducere tiden til hæmostase og muliggøre tidligere mobilitet. En nylig systematisk gennemgang af 13 kommercielt tilgængelige anordninger, viste, at mediantiden til opnåelse af hæmostase med en vaskulær lukkeanordning var 5,4 minutter. Mediantiden til

hæmostase for de enkelte vaskulære lukkeanordninger varierede fra 1 minut (FemoSeal™ VCS) til 14 minutter, hvor størstedelen af anordningerne lå mellem 4 og 10 minutter.<sup>1</sup>

Almindeligt rapporterede bivirkninger, der er forbundet med lukning af arteriotomistedet med manuelle kompressioner, eksterne hæmostatiske anordninger eller vaskulære lukkeanordninger omfatter hæmatom, blødning ved adgangsstedet, pseudoaneurisme, arteriovenøs fistel og infektion. Den samme systematiske gennemgang (34 randomiserede kontrollerede forsøg, 14.401 patienter) fandt, at forekomsten af uønskede hændelser var ens mellem manuel kompression og brugen af vaskulære lukkeanordninger, bortset fra at blødning havde en tendens til at være lidt højere med vaskulære lukkeanordninger.<sup>1</sup>

## 1.6 Forslag til brugerprofil og uddannelse

De tilsigtede brugere af FemoSeal™ Vascular Closure System er læger med en uddannelse, der kvalificerer dem til at udføre arteriel adgang og lukning i forbindelse med endovaskulære procedurer gennem femoralarterien, og som har deltaget i et Terumo Medical Corporations FemoSeal™ lægevejledningsprogram.

## 1.7 Relevante harmoniserede og fælles standarder

| Standardreference | Indeværende år for komplians/rev. | Beskrivelse                                                                                                                              |

Durch diesen Kurzbericht über die Sicherheit und klinische Leistung (Summary of Safety and Clinical Performance, SSCP) soll die Öffentlichkeit eine aktualisierte Zusammenfassung der wichtigsten Aspekte der Sicherheit und der klinischen Eigenschaften des FemoSeal™ Vascular Closure Systems (VCS) erhalten.

Einen Kurzbericht über Sicherheit und klinische Leistung des Produkts für Anwender/medizinisches Fachpersonal finden Sie in **Abschnitt 1.0**.

## **1.0 KURZBERICHT FÜR ANWENDER/MEDIZINISCHES FACHPERSONAL**

Der SSCP soll die Bedienungsanleitung, die das wichtigste Dokument zur Sicherstellung der gefahrlosen Verwendung des Produkts ist, nicht ersetzen und den Anwendern oder den Patienten auch keine diagnostischen oder therapeutischen Anregungen geben. Der SSCP ersetzt nicht die Pflichtangaben auf den Implantatausweisen oder in anderen Pflichtdokumenten.

### **1.1 Bestimmungsgemäße Verwendung des Produkts**

#### **1.1.1 Bestimmungsgemäße Verwendung**

Das FemoSeal™ Vascular Closure System ist ein Medizinprodukt zum Verschließen einer Arterienpunktion nach perkutaner Katheterisierung durch die A. femoralis communis.

#### **1.1.2 Indikationen**

Das FemoSeal™ Vascular Closure System ist für das Verschließen der A. femoralis communis (Arteriotomie) bei perkutaner Katheterisierung mit einer Prozedurdurchleuse 7F (2,33 mm) oder kleiner indiziert.

#### **1.1.3 Kontraindikationen und/oder Einschränkungen**

Das FemoSeal™ Vascular Closure System ist kontraindiziert bei Patienten mit Arteriotomien, bei denen Schleusen oder Produkte mit einem Durchmesser von mehr als 2,33 mm (7F) verwendet wurden.

#### **1.1.4 Patientenpopulationen**

Die Sicherheit und Wirksamkeit des FemoSeal™ Vascular Closure Systems wurde bei Patienten ab 18 Jahren nachgewiesen, die sich einer perkutanen Katheterisierung mit einer Prozedurdurchleuse 7F (2,33 mm) oder kleiner unterzogen haben.

#### **1.1.5 Besondere Patientenpopulationen**

Die Sicherheit und Wirksamkeit des FemoSeal™ Vascular Closure Systems wurde bei den folgenden Patientengruppen nicht nachgewiesen:

- Patienten mit vorbestehender Autoimmunerkrankung.
- Patienten, die sich einer therapeutischen Thrombolysebehandlung unterziehen.
- Patienten mit klinisch signifikanter peripherer Gefäßerkrankung.
- Patienten mit unkontrollierter Hypertonie (> 220 mmHg systolisch oder > 110 mmHg diastolisch).

- Patienten mit einer Blutungsstörung, einschließlich Thrombozytopenie ( $< 100.000$  Thrombozyten) oder Anämie ( $\text{Hgb} < 10 \text{ mg/dl}$ ).
- Patienten, bei denen das Innenlumen der A. femoralis communis kleiner als 5 mm ist.
- Patienten mit Nieren- und/oder Leberfunktionsstörungen.
- Patienten mit anderen relevanten Komorbiditäten.
- Patienten bestimmter Abstammung und/oder ethnischer Herkunft.
- Patienten, die vor weniger als 72 Stunden einen Myokardinfarkt erlitten haben.
- Patienten mit einem Gefäßersatz oder Stent an der Punktionsstelle.
- Schwangere oder stillende Patientinnen.
- Patienten unter 18 Jahren.

### 1.1.6 Vorgesehene Anwender

Vorgesehene Anwender des FemoSeal™ Vascular Closure Systems sind Ärztinnen und Ärzte mit der erforderlichen Qualifizierung, um arterielle Zugänge und Verschlüsse bei endovaskulären Eingriffen über die A. femoralis communis herstellen zu dürfen, die an einem ärztlichen FemoSeal™ Schulungsprogramm der Terumo Medical Corporation teilgenommen haben.

## 1.2 Produktbeschreibung

### 1.2.1 Beschreibung des Produkts

Das von der Terumo Medical Corporation (TMC) hergestellte FemoSeal™ Vascular Closure System ist ein resorbierbares Gefäßverschlussystem, das entwickelt wurde, um nach einer perkutanen Katheterisierung durch die A. femoralis communis eine femorale arterielle Hämostase zu erreichen.

FemoSeal™ Verschlusselemente bestehen aus zwei resorbierbaren Polymerscheiben, der Innendichtung und der äußeren Sperrscheibe, die durch ein resorbierbares Multifilament zusammengehalten werden und so die Arteriotomie mechanisch abdichten (siehe **Abbildung 1.1** und **Abbildung 1.2**). Nach dem Entfalten durch die Kegelschleuse wird die äußere Sperrscheibe auf die Multifilamentwelle gedrückt, was zu einem mechanischen Verschluss der Punktionsstelle zwischen der Innendichtung und der äußeren Sperrscheibe führt. Die Innendichtung und die äußere Sperrscheibe werden durch Reibung auf der Multifilamentwelle gehalten. Die Hämostase wird mechanisch erzielt. Die Verschlusselemente werden durch Hydrolyse abgebaut.

Die implantierbaren Verschlusskomponenten, die Innendichtung und die äußere Sperrscheibe werden innerhalb von achtzehn (18) Monaten abgebaut, während das Multifilament

schätzungsweise nach zwei (2) bis drei (3) Jahren abgebaut und durch Hydrolyse vom umliegenden Gewebe absorbiert wird. In Tests wurde die Fähigkeit der implantierbaren Verschlusskomponenten nachgewiesen, die Kompression auf der Arteriotomie bis zu acht (8) Stunden aufrechtzuerhalten. Die Abbauprodukte werden metabolisiert und im Urin ausgeschieden oder als Kohlendioxid über die Lunge ausgeatmet. In Tierversuchen wurden keine Akkumulationseffekte beobachtet. Die zusätzlichen Komponenten des FemoSeal™ Vascular Closure Systems, die während des Eingriffs mit lebendem Gewebe oder Blut in Kontakt kommen, sind Kegelschleuse, Dilatator, Tamper, Pusher und Führungsdraht.

**Abbildung 1.1 Innendichtung und äußere Sperrscheibe**

**Abbildung 1.2 Innendichtung und äußere Sperrscheibe eingesetzt**

Die FemoSeal™ Einheit wird zusammen mit einem Dilatator und einem Führungsdraht mit 0,038" (0,97 mm) Außendurchmesser, 27,5" (70 cm) Länge sowie einer J-Spitze geliefert, siehe **Abbildung 1.3** unten. Der Führungsdraht befindet sich in einem Polyethylenschlauch. Alle Teile sind in einer stabilen Papierkassette verpackt. Die Verpackung enthält auch den Implantatausweis für den/die Patienten/Patientin. Das FemoSeal™ Vascular Closure System erfordert kein zusätzliches Zubehör, um wie vorgesehen zu funktionieren. Das Produkt ist nur für die Verwendung mit dem Dilatator und dem Führungsdraht vorgesehen, die in der Produktverpackung enthalten sind.

Abbildung 1.3 FemoSeal™ VCS Einheit mit Führungsdraht und Dilatator

### 1.2.2 Materialien und Komponenten

In **Tabelle 1.1** unten sind die Komponenten des FemoSeal™ VCS aufgeführt.

**Tabelle 1.1 FemoSeal™ VCS Materialien und Komponenten**

\*Implantierbarer Teil des Produkts; die implantierbaren Komponenten sind MRT-sicher

Das FemoSeal™ VCS wurde mittels Ethylenoxid (EO) sterilisiert und ist ein Medizinprodukt für den Einmalgebrauch. Das FemoSeal™ VCS ist so konzipiert, dass es nicht wiederverwendet werden kann.

**Wirkungsweise**

Das FemoSeal™ VCS fördert die mechanische Hämostase, indem implantierbare Verschlusselemente innerhalb und außerhalb der A. femoralis communis platziert werden. Der Mechanismus zur Verhinderung von Blutungen wird durch die Innendichtung, die die Punktionsstelle abdichtet, und die äußere Sperrscheibe, die die Innendichtung in Position hält, gewährleistet.

### 1.2.3 Klinischer Nutzen

Das FemoSeal™ VCS bietet folgenden klinischen Nutzen beim Gefäßverschluss nach Punktionen der A. femoralis communis:

- Verkürzung der Zeit bis zur Hämostase<sup>1</sup>
- Verkürzung der Zeit bis zur Mobilisierung<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, S. 32–44.

### 1.2.4 Vorherige Generation(en) oder Varianten

- Die erste Version des FemoSeal™ VCS (Nr. 11200) wurde 2005 und teilweise 2006 auf dem europäischen Markt verkauft.
- Das aktuelle FemoSeal™ VCS (Nr. 11202) mit verbessertem Applikationssystem ist seit dem 28. März 2006 auf dem Markt.

### 1.2.5 Zubehör zur Verwendung in Kombination mit dem Produkt

Die FemoSeal™ Einheit wird zusammen mit einem Dilatator und einem Führungsdraht mit 0,038" (0,97 mm) Außendurchmesser, 27,5" (70 cm) Länge sowie einer J-Spitze geliefert. Der Führungsdraht ist ein Zubehörteil der FemoSeal™ Einheit. Die J-Spitze ist eine Komponente des Führungsdrahts, während der Dilatator eine Komponente der FemoSeal™ Einheit ist. Der Führungsdraht ist das einzige Zubehör dieses Medizinprodukts. Der Führungsdraht befindet sich in einem Polyethylenschlauch. Alle Teile sind in einer stabilen Papierkassette verpackt. Die Verpackung enthält auch den Implantatausweis für den/die Patienten/Patientin. Das FemoSeal™ Vascular Closure System erfordert kein zusätzliches Zubehör, um wie vorgesehen zu funktionieren. Das Produkt ist nur für die Verwendung mit dem Dilatator und dem Führungsdraht vorgesehen, die in der Produktverpackung enthalten sind.

### 1.2.6 Andere Vorrichtungen und Produkte, die für die Verwendung in Kombination mit dem Produkt vorgesehen sind

Das FemoSeal™ VCS erfordert keine zusätzlichen Vorrichtungen, um wie vorgesehen zu funktionieren.

## 1.3 Risiken und Warnhinweise

### 1.3.1 Restrisiken und unerwünschte Wirkungen

Bekannte oder vorhersehbare unerwünschte Ereignisse, Probleme und Komplikationen im Zusammenhang mit der Verwendung des FemoSeal™ VCS als Folge von Restrisiken sind in **Tabelle 1.2** aufgeführt. Die Häufigkeitsrate basiert auf einer Analyse der Dokumentation zu Risiken und wurde auf der Grundlage von Überwachungsdaten nach dem Inverkehrbringen aus dem Zeitraum vom 1. September 2019 bis 31. August 2024 berechnet. Es gibt keine unbekannten Restrisiken für das FemoSeal™ VCS, und alle anwendbaren Risiken wurden durch die Bedienungsanleitung und den Risikomanagementprozess behandelt.

**Tabelle 1.2. FemoSeal™, unerwünschte Ereignisse/Komplikationen**

| Problem                   | Häufigkeitsrate (%) | Minderungsfaktoren                                                                                                                                                                            |

### 1.3.2 Warnhinweise und Sicherheitsmaßnahmen

#### Warnhinweise

1. Nicht verwenden, wenn die Verpackung beschädigt oder eine Sterilbarriere nicht intakt ist.
2. Nicht nach Ablauf des Verfallsdatums verwenden, da die biologisch abbaubaren Komponenten dann eventuell nicht mehr wie vorgesehen funktionieren.
3. Nicht verwenden, wenn Elemente beschädigt oder in irgendeiner Weise defekt erscheinen.
4. Wenn die Prozedurschleuse oder das umgebende Gewebe bakteriell kontaminiert sind, kann die Verwendung des FemoSeal™ Vascular Closure Systems eine Infektion verursachen.
5. Wenn vermutet wird, dass die hintere Arterienwand punktiert wurde, oder wenn mehr als eine arterielle Punktion vorgenommen worden ist, sollte nicht allein auf das FemoSeal™ Vascular Closure System zurückgegriffen werden, um eine arterielle Hämostase zu erreichen. Setzen Sie in diesem Fall zusätzliche manuelle oder mechanische Kompression ein.
6. Wenn die arterielle Punktionsstelle an oder distal der Bifurkation der A. femoralis liegt, sollte das FemoSeal™ Vascular Closure System nicht verwendet werden. In diesem Fall besteht die Gefahr, dass sich die Innendichtung nicht korrekt positionieren lässt. Ein solches Ereignis wiederum könnte zu einer Blutungskomplikation und/oder zu einer Unterbrechung des normalen Blutflusses führen.
7. Wenn eine persistierende arterielle Blutung am Ort der Inzision besteht, darf das Multifilament nicht gekappt werden, bevor die Blutung gestillt ist. Wenn keine Hämostase erreicht wird, befestigen Sie das Multifilament mit einem sterilen Wundverband und ergreifen Sie zusätzliche Maßnahmen zur Kompression, bis die

Hämostase erreicht ist. Bei einer persistierenden arteriellen Blutung können erhebliche Blutungskomplikationen auftreten, die zu Verletzungen oder zum Tod des Patienten führen können.

8. Verwenden Sie das FemoSeal™ Vascular Closure System nicht, wenn sich die Punktionsstelle in der Nähe des Ligamentum inguinale befindet, da dies zu einem retroperitonealen Hämatom führen kann.
9. Bei Patienten mit einem höheren Blutungsrisiko kann es zu einem verstärkten Blutverlust kommen, der eine Transfusion erfordert.
10. Wenn sich die Innendichtung löst, kann dies ein thrombotisches und/oder embolisches Ereignis verursachen.

### **Vorsichtsmaßnahmen**

1. Das Einsetzen des FemoSeal™ Vascular Closure Systems sollte ausschließlich von Ärzten durchgeführt werden, die im Einsatz des Systems entsprechend geschult wurden.
2. Führen Sie vor dem Einsetzen des FemoSeal™ Vascular Closure Systems ein begrenztes femorales Angiogramm oder eine ultraschallgeführte femorale Punktion durch.
3. Brechen Sie den Eingriff unter folgenden Umständen ab:
  - Der Lumendurchmesser der A. femoralis communis ist kleiner als 5 mm.
  - Es befinden sich eine Stenose und/oder signifikante Plaque in der Nähe der gemeinsamen Punktionsstelle der A. femoralis communis.
  - Die Punktionsstelle befindet sich an oder distal der Bifurkation der A. femoralis.
  - Es befinden sich abnorme Verzweigungen oder Gefäßanomalien in der Nähe der Punktionsstelle der A. femoralis communis.
4. Wenn ein Hämatom vorhanden ist, muss besonders darauf geachtet werden, dass die Kegelschleuse korrekt in die Arterie eingeführt wird.
5. Punktieren Sie einwandig. Punktieren Sie nicht die posteriore Arterienwand.
6. Bei der Verwendung des FemoSeal™ Vascular Closure Systems sind stets sterile Verfahren einzuhalten.
7. Das FemoSeal™ Vascular Closure System ist nur zum einmaligen Gebrauch bestimmt und darf nicht wiederverwendet oder erneut sterilisiert werden. Die FemoSeal™ Einheit ist so konzipiert, dass sie nicht wiederverwendet werden kann.
8. Wenn Sie beim Einsetzen der Innendichtung auf einen unerwarteten Widerstand stoßen, muss der Vorgang abgebrochen werden.

9. Um die Innendichtung richtig einzusetzen, positionieren Sie Ihren Daumen so, dass die Taste frei zurückfedern kann.
10. Stellen Sie sicher, dass sich die Spitze der Kegelschleuse der FemoSeal™ Einheit unter der Hautoberfläche befindet, bevor Sie die äußere Sperrscheibe befestigen. Bei Patienten mit kurzem Abstand zwischen der A. femoralis und der Hautoberfläche kann es zu einer unbeabsichtigten Festsetzung der äußeren Sperrscheibe über dem Hautlevel kommen.
11. Für eine korrekte Platzierung muss eventuell vor dem Einsetzen eine Hautinzision durchgeführt werden.
12. Wenn sich die Innendichtung in der Arterie befindet und es dennoch nicht möglich ist, die Verschluss Taste vollständig zu drücken und die äußere Sperrscheibe zu befestigen, muss eventuell ein chirurgischer Eingriff vorgenommen werden, um die FemoSeal™ Verschlusselemente zu entfernen.
13. Falls innerhalb von 18 Monaten eine erneute Punktion derselben A. femoralis erforderlich wird, ist diese mindestens einen Zentimeter proximal zur ersten Zugangsstelle des FemoSeal™ Vascular Closure Systems auszuführen.
14. Weisen Sie den Patienten/die Patientin an, sich genau an die ärztlichen Anweisungen zur Inspektion der Verschlussstelle zu halten.
15. Weisen Sie den Patienten/die Patientin an, die Patienteninformationskarte für die nächsten 18 Monate mitzuführen.

### **Vorsichtsmaßnahmen bei der Entlassung**

Untersuchen Sie den Patienten/die Patientin vor seiner/ihrer Entlassung auf folgende klinische Symptome:

1. Blutung und/oder Hämatom an der Verschlussstelle.
2. Schmerzen beim Gehen.
3. Entzündungszeichen an der Verschlussstelle.

### **1.3.3 Sicherheitsmaßnahmen im Feld**

Im Zeitraum vom 1. September 2019 bis zum 31. August 2024 gab es eine Sicherheitsmaßnahme im Feld, die das FemoSeal™ VCS betraf.

Im Jahr 2022 hat Terumo FemoSeal™ VCS freiwillig zurückgerufen, da Beschwerden eingereicht wurden, in denen Fehler bei Prozess- und Losfreigabeproofungen in von Elcton hergestellten FemoSeal-Produkten zur Messung der Stampfkraft und der Rückzugskraft gemeldet wurden. Insgesamt wurden 950 Einheiten aus Südkorea zurückgerufen.

## 1.4 Zusammenfassung der klinischen Bewertung und der klinischen Nachbeobachtung nach dem Inverkehrbringen

**Tabelle 1.3** enthält eine Liste der Zulassungsstudien, die für die Markteinführung von FemoSeal™ VCS durchgeführt wurden, sowie der Studien und der klinischen Nachbeobachtungen nach dem Inverkehrbringen. Die in der Studie verwendete Produktversion ist in der folgenden Tabelle aufgeführt. Die erste Version des FemoSeal™ VCS (Nr. 11200) war bis 2006 auf dem Markt, die Nachfolgeversion (Nr. C11202) wurde 2006 auf den Markt gebracht und ist bis heute erhältlich.

**Tabelle 1.3 Zusammenfassung der Zulassungsstudien**

| <b>Funktionelle Tierversuche vor dem Inverkehrbringen</b>                                                                                                                                                                                                               | <b>Produktversion</b>      |

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002</p> <p>Radi Medical System AB</p> <p>Durchgeführt von Biomatech, Frankreich</p> | <p>Tierstudie</p> | <p>Ziel der Studie war es, die Biokompatibilität und Biofunktionalität eines biologisch abbaubaren Implantats zu bewerten, das entwickelt wurde, um eine Hämostase im Gefäßsystem zu erreichen. Das geprüfte Produkt sollte in die Punktieröffnung der Arterien eindringen, um eine Hämostase zu erreichen. Eine Scheibe trat in die Punktionsöffnung in der Arterie ein, die andere zog die Innenscheibe von außerhalb der Arterie an. Beide Scheiben wurden durch eine Einführschleuse eingeführt. Die Scheiben wurden so konzipiert, dass sie Blutungen verhindern, in die Gefäßwand einheilen und schließlich abgebaut und resorbiert werden. Die Studie diente der Erfassung und Analyse von Daten nach funktioneller Implantation in Schafen und in einem Schwein, um die Fähigkeit des Implantats zur Aufrechterhaltung der physiologischen Funktion bei Verwendung im Kreislaufsystem zu bewerten, die Reaktion des Wirts und die Reaktion des Produkts</p> | <p>Implantationszeitraum/Nachbeobachtung beträgt 5 Wochen für alle Tiere</p> <p>4 Schafe, 1 Schwein</p> <p>14 Verschlusselemente</p> <p>8 Verschlusselemente in 2 Schafen implantiert,</p> <p>2 Verschlusselemente in 1 Schwein implantiert</p> <p>Wenn zwei Verschlusselemente in dieselbe A. femoralis implantiert wurden, wurden sie in einem Abstand von &gt; 30 mm implantiert</p> | <p>Alle unerwünschten Anzeichen (Entzündungen, Nekrosen, Blutungen oder andere Läsionen) oder die Bildung einer dünnen pseudo-intimalen Schicht wurden erfasst. Besondere Aufmerksamkeit wurde der anfänglichen geweblichen Integration des Produkts gewidmet, mit besonderem Augenmerk auf die Verkapselung der Innenscheibe.</p> <p>Makroskopisch wurden keine signifikanten Anzeichen einer lokalen Intoleranz oder Thrombusbildung beobachtet. Die makroskopische Beobachtung ergab keinen Unterschied zwischen Schaf und Schwein nach der Implantation der Verschlusselemente in die A. femoralis.</p> <p>Makroskopisch wurden keine signifikanten Anzeichen einer lokalen Intoleranz oder Thrombusbildung beobachtet. Die makroskopische Beobachtung ergab keinen Unterschied zwischen Schaf und Schwein nach der Implantation der Verschlusselemente in die A. femoralis.</p> |

|  |  |  | (körperliche Unversehrtheit, gewebliche Verkapselung bei der Tötung) zu bestimmen und die Degradation des Implantats zu bewerten |  | <p>Die histopatologische Analyse der Implantationsstelle bei Schafen ergab keine lokalen Nebenwirkungen. Die Innen- und Außenscheiben zeigten Anzeichen von Degradation und waren in einigen Fällen in kleinere Teile zerbrochen. Die Innenscheiben waren vollständig in das neointimale Gewebe integriert. Bei dem Schwein zeigte die histopatologische Analyse etwas mehr Entzündungszeichen um die Innen- und Außenscheibe. Bei beiden Tierrgattungen wies das Multifilament etwas mehr Entzündungszeichen auf als das Scheibenmaterial, was bei geflochtenem Nahtmaterial aufgrund der größeren Oberfläche normal ist.</p> <p>Die Durchgängigkeit der Gefäße wurde nach 5 Wochen mit drei verschiedenen Methoden gemessen: histomorphometrisch, histomorphometrisch in Kombination mit der Messung des Gefäßdurchmessers mit einer Schieblehre und mit Farbdoppler-Sonographie. Die mittlere Gefäßdurchgängigkeit bei den Schafen lag je nach Methode zwischen 60 und 80 % (12 Beobachtungen). Beim Schwein lag die mittlere</p> |

Im Rahmen des Entwicklungsplans für FemoSeal™ VCS vor dem Inverkehrbringen wurden drei Funktionstests an Tieren durchgeführt. Im Jahr 2000 wurde vor Beginn der klinischen Studien eine Tierstudie zur Bewertung der Biofunktionalität von FemoSeal™ VCS durchgeführt. In dieser Studie wurde der Abbau der Verschlusselemente beurteilt sowie deren Fähigkeit, die physiologische Funktion aufrechtzuerhalten. Nach 18 Monaten war das Material der Innen- und der Außenscheibe nicht mehr sichtbar, da es durch ein endoluminales fibröses Gewebe ersetzt worden war. Zusammenfassend lässt sich sagen, dass die Fähigkeit des FemoSeal™ VCS Verschlusselements zur Aufrechterhaltung der physiologischen Funktion bei Verwendung im Kreislaufsystem bestätigt wurde.

Im Jahr 2002 wurde eine Tierstudie durchgeführt, um die Biokompatibilität und Biofunktionalität eines biologisch abbaubaren Implantats, des FemoSeal™ VCS, zu untersuchen, das für die Hämostase im Gefäßsystem entwickelt wurde. Zusammenfassend lässt sich sagen, dass der Abbau des Implantats innerhalb von 36 Wochen nahezu abgeschlossen war und keine signifikanten unerwünschten Gewebereaktionen auftraten.

Eine weitere Tierstudie aus dem Jahr 2002 untersuchte die Biokompatibilität und Biofunktionalität eines biologisch abbaubaren Implantats, des FemoSeal™ VCS, das für die Hämostase im Gefäßsystem entwickelt wurde. Nach 5 Wochen war die Einkapselung der Innenscheibe abgeschlossen, und es wurden Anzeichen von Degradation bei der Innen- und der Außenscheibe beobachtet. Zusammenfassend wurde die Fähigkeit des Implantats zur Aufrechterhaltung der physiologischen Funktion beim Einsatz im Kreislaufsystem bestätigt.

Im Rahmen des klinischen Entwicklungsplans für das FemoSeal™ VCS hat Radi Medical System AB eine klinische Studie vor dem Inverkehrbringen durchgeführt. Diese klinische Studie ist weder veröffentlicht noch online verfügbar. Die Studie mit dem Produktmodell Nr. 11200 wurde 2002–2004 gemäß der Europäischen Norm EN 540 (Klinische Prüfung von Medizinprodukten an Menschen) und in Übereinstimmung mit den ICH General Considerations for Clinical Trials und der Guideline for Good Clinical Practice durchgeführt. Die Details dieser Studie sind im Bericht EU-SE-001 dokumentiert. Die klinische Prüfung wurde im Abschlussbericht von Radi Medical Systems AB, „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures“, dokumentiert. Die klinische Studie wurde mit der ersten FemoSeal™-Version Nr. 11200 durchgeführt und konzentrierte sich auf die Sicherheit und Wirksamkeit der implantierbaren Verschlusskomponenten. Der einzige Unterschied zwischen der ersten Version Nr. 11200 und der aktuellen Version Nr. C11202 ist die französische Größe, 6F bzw. 7F, und das verbesserte Applikationssystem. Der klinische Nutzen, der Verwendungszweck, die Funktionsprinzipien und die Ausgangsmaterialien der implantierbaren Verschlusselemente, der Innendichtung und der äußeren Sperrscheibe, sind unverändert.

Das Produkt war für Patienten bestimmt, die sich diagnostischen oder interventionellen kardiologischen Verfahren unter Verwendung der Oberschenkelarterie als Zugangsstelle unterziehen. Ziel dieser Studie war es, die Sicherheit, Leistung und Wirksamkeit des FemoSeal™ VCS zu bestimmen. Es handelte sich um eine prospektive, multizentrische, einarmige Open-Label-Studie mit einer Nachbeobachtung nach 30 Tagen.

Der primäre Leistungsendpoint war die Zeit bis zur Hämostase, definiert als das Ausbleiben von Blutungen. Der primäre Sicherheitsendpoint war die Inzidenz schwerer vaskulärer Komplikationen innerhalb von 30 Tagen nach dem Eingriff. Sekundäre Endpunkte waren die Zeit bis zur Mobilisierung, der Anteil der Behandlungsversagen, die Inzidenz unerwünschter Ereignisse und die Leistungsmerkmale des Produkts während der Applikation und des Einsetzens.

Die in diese Studie aufgenommenen Patienten waren Erwachsene, die in der Lage waren, eine Einwilligungserklärung abzugeben und mindestens einen intakten Pedalpuls hatten. Die Patienten wurden von der Studie ausgeschlossen, wenn sie an einer der folgenden Erkrankungen litten:

- Vorgeschichte einer peripheren Gefäßerkrankung
- Autoimmunerkrankung
- Bekannte Blutungsstörung oder schwere Anämie
- INR > 1,5
- Myokardinfarkt innerhalb von 72 Stunden

- Unkontrollierte Hypertonie trotz Behandlung
- Adipositas, die einen Zugang mithilfe der Seldinger-Technik ausschließt
- Vorhandensein eines Gefäßersatzes oder Stents an der Arteriotomiestelle
- Vorheriges ipsilaterales Punktieren innerhalb von 3 Monaten
- Lebenserwartung < 6 Monate

Darüber hinaus wurden die Patienten intraoperativ untersucht und aus der Studie ausgeschlossen, wenn eines der folgenden Merkmale festgestellt wurde:

- Lumendurchmesser der A. femoralis communis < 5 mm
- Arterienäste innerhalb von 2 cm proximal der Punktionsstelle
- Signifikante Stenose innerhalb von 3 cm der Punktionsstelle
- Verwendung einer Haupteinführschleuse > 6 Fr
- Punktion an oder distal der femoralen Bifurkation
- Mehrere femorale Punktionen
- Bekanntes oder vermutete Punktion der posterioren Femurwand
- Großes Hämatom (2:6 cm) nach Abschluss des Eingriffs
- Schwieriges Einführen der Primärschleuse bei Verfahren aufgrund von gewundenem Gewebe oder Gefäß

Diese Einzelprotokollstudie wurde in zwei Abschnitten durchgeführt: In Abschnitt 1 wurden 20 Patienten aufgenommen, dann wurde eine Sicherheitsanalyse durchgeführt, und in Abschnitt 2 wurden weitere 60 Patienten aufgenommen.

In Abschnitt 1 betrug das Durchschnittsalter der aufgenommenen Patienten 65,9 Jahre, 70,0 % der Patienten waren männlich und 95 % der Patienten erhielten Begleitmedikamente. In Abschnitt 2 der Studie lag das Durchschnittsalter bei 63,8 Jahren, 78 % waren männlich und 100 % der Patienten erhielten Begleitmedikamente.

Patienten, die sich einer diagnostischen (Abschnitt 1 und Abschnitt 2) oder interventionellen (Abschnitt 2) Herzkatheteruntersuchung unterzogen, konnten in die Studie aufgenommen werden. Die Verfahren entsprachen der Standardversorgung in jedem der teilnehmenden Krankenhäuser, gefolgt vom Einsatz des FemoSeal™ VCS. Die Patientendaten wurden zu Studienbeginn, während des Eingriffs sowie 1 Tag und 30 Tage nach dem Eingriff erhoben. Die Ergebnisse sind in **Tabelle 1.5** zusammengefasst und zeigen, dass das FemoSeal™ VCS für die Anwendung bei dieser Patientengruppe sicher und wirksam ist.

| Mittlere Zeit bis zur Mobilisierung                                                                                         | 72,2 Minuten | 87,5 Minuten <sup>b</sup> |
| Inzidenz schwerer vaskulärer Komplikationen <sup>c</sup>                                                                    | 0 (0 %)      | 1 (2 %)                   |
| Anzahl der Patienten mit unerwünschten Ereignissen                                                                          | 5 (25 %)     | 19 (32 %)                 |
| Behandlungsversagen (definiert als schwere vaskuläre Komplikationen, Notwendigkeit einer manuellen Kompression oder beides) | 0 (0 %)      | 3 (5 %)                   |
| Fehlfunktionen des Produkts                                                                                                 | 0 (0 %)      | 6 (10 %)                  |

<sup>a</sup>Basierend auf einer Gesamtstichprobengröße von 58, da 2 Patienten zum Zeitpunkt des Eingriffs aufgrund vorheriger ipsilateraler Punktionen keine Hämostase erreichten. Die Hämostase wurde bei diesen Patienten nach 7 Minuten bzw. nach 37 Minuten erreicht.

<sup>b</sup>Basierend auf einer Gesamtstichprobengröße von insgesamt 59: 1 Patient wurde nicht berücksichtigt, weil er aufgrund eines Lungenödems an ein Beatmungsgerät angeschlossen wurde und über eine Woche lang nicht mobil war.

<sup>c</sup>Definiert als vaskuläre Komplikation, die eine Bluttransfusion oder eine operative Intervention erfordert, oder lokale Infektion, die die Verabreichung von Antibiotika, einen Krankenhausaufenthalt oder eine Verlängerung des Krankenhausaufenthalts oder ein Debridement der betroffenen Stelle erfordert.

In Abschnitt 1 der Studie wurden keine größeren vaskulären Komplikationen beobachtet. In Abschnitt 2 der Studie wurde eine schwere vaskuläre Komplikation verzeichnet: ein Pseudoaneurysma, das innerhalb eines Tages nach dem Eingriff auftrat. Das Ereignis erforderte eine ultraschallgeführte Kompression und eine Thrombininjektion in das Pseudoaneurysma und verlängerte den Krankenhausaufenthalt des Patienten.

Von den fünf unerwünschten Ereignissen, die in Abschnitt 1 der Studie berichtet wurden, gab es ein möglicherweise produktbedingtes unerwünschtes Ereignis: ein nicht schwerwiegendes Ereignis mit starken Blutungen am ersten Tag nach dem Eingriff. Von den 19 unerwünschten Ereignissen, die in Abschnitt 2 der Studie berichtet wurden, wurden drei produktbedingte, nicht schwerwiegende unerwünschte Ereignisse in Form von Hämatomen und sechs möglicherweise produktbedingte, nicht schwerwiegende Ereignisse beobachtet, darunter drei Berichte über anhaltende Sickerblutungen, zwei Hämatome und ein Beinschmerz nach Belastung.

In Abschnitt 2 gab es drei Patienten, bei denen die Behandlung fehlschlug: Bei zweien war dies darauf zurückzuführen, dass die Hämostase ohne Kompression nicht erreicht werden konnte, und bei einem darauf, dass es zu einer schweren vaskulären Komplikation (Pseudoaneurysma) kam. In Abschnitt 1 der Studie kam es zu keinem Behandlungsversagen.

Von den sechs Fehlfunktionen des Produkts in Abschnitt 2 der Studie beeinträchtigten drei das Verfahren nicht, eine wurde auf einen Anwenderfehler zurückgeführt, eine war eine Undichtigkeit der Einführschleuse und eine war eine gebrochene Filamentverbindung. Die beiden letztgenannten Probleme wurden durch Aktualisierungen bei der Version Nr. C11202 gelöst.

In Abschnitt 2 der klinischen Studie vor dem Inverkehrbringen wurden die Ergebnisse der 6-monatigen Nachbeobachtung aufgrund der Nichteinhaltung der Vorgaben durch die Patienten nicht berichtet. Die 30-Tage-Ergebnisse der klinischen Studie vor dem Inverkehrbringen (EU-SE-001), die mit dem in der klinischen Literatur angegebenen Nachbeobachtungszeitraum übereinstimmen, zeigen, dass das FemoSeal™ VCS sicher und wirksam ist.

#### 1.4.2 Zusammenfassung der Daten aus klinischen Studien nach dem Inverkehrbringen

Es gibt vier abgeschlossene klinische Studien nach dem Inverkehrbringen, die in der folgenden **Tabelle 1.6** beschrieben sind. Diese klinischen Studien sind weder veröffentlicht noch online verfügbar.

**Tabelle 1.6 Klinische Studien nach dem Inverkehrbringen**

| Klinische Studien nach dem Inverkehrbringen                                                 |              |                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                     |

| Confirmatory Assessment of FemoSeal™ Vascular Closure System in 7F-Sheath. (2008) | Dr. Nicolas Moes, Medizinische Universität Innsbruck, Österreich | Bestätigende Bewertung nach dem Inverkehrbringen | Ziel dieser Studie war es, die Sicherheit und Leistungsfähigkeit von FemoSeal® bei der Verwendung in der normalen klinischen Routine bei Patienten zu bewerten, die sich einer diagnostischen Herzkatheteruntersuchung oder einem perkutanen kardiologischen Eingriff mit einer 7F-Schleuse unterziehen. | 50 konsekutive Patienten<br><br>Indikation: diagnostische oder invasive Herzkatheterisierung über die A. femoralis communis<br><br><table><tr><td>n</td><td>50</td></tr><tr><td>men</td><td>35 (70%)</td></tr><tr><td>women</td><td>15 (30%)</td></tr><tr><td>PCI cases</td><td>15</td></tr><tr><td>age (yrs)</td><td>62.8±11.1</td></tr><tr><td>body mass index (kg/m²)</td><td>25.4±6.7</td></tr><tr><td>systolic BP (mmHg)</td><td>131.2±20.9</td></tr><tr><td>diastolic BP (mmHg)</td><td>77.9±10.6</td></tr><tr><td>diabetes mellitus</td><td>9 (18%)</td></tr><tr><td>arterial hypertension</td><td>34 (68%)</td></tr><tr><td>previous coronary intervention</td><td>13 (26%)</td></tr><tr><td>preprocedure aspirin</td><td>50 (100%)</td></tr><tr><td>preprocedure clopidogrel</td><td>50 (100%)</td></tr><tr><td>Procedural unfractionated heparin</td><td>15 (30%)</td></tr><tr><td>Procedural abciximab</td><td>2 (4%)</td></tr></table> | n | 50 | men | 35 (70%) | women | 15 (30%) | PCI cases | 15 | age (yrs) | 62.8±11.1 | body mass index (kg/m²) | 25.4±6.7 | systolic BP (mmHg) | 131.2±20.9 | diastolic BP (mmHg) | 77.9±10.6 | diabetes mellitus | 9 (18%) | arterial hypertension | 34 (68%) | previous coronary intervention | 13 (26%) | preprocedure aspirin | 50 (100%) | preprocedure clopidogrel | 50 (100%) | Procedural unfractionated heparin | 15 (30%) | Procedural abciximab | 2 (4%) | Primäre Endpunkte <ul style="list-style-type: none"><li>Primärer Wirksamkeitsendpunkt – TTH (Zeit bis zur Hämostase) mit oder ohne Sickerblutung, aber ohne zusätzliche manuelle oder mechanische Kompression.</li><li>Sicherheitsendpunkt – Inzidenz unerwünschter Ereignisse – kleinere und größere vaskuläre Komplikationen und alle anderen unerwünschten Ereignisse – schwerwiegende und nicht schwerwiegende – während der Dauer der Studie (d. h. bis zur Entlassung des Patienten).</li></ul> Ergebnisse <ul style="list-style-type: none"><li>Mittlere Zeit bis zur Hämostase</li><li>Diagnostisch – 56,6 ± 29 Sekunden</li><li>Interventionell – 59,9 ± 16,2 Sekunden</li><li>Alle Patienten 57,8 ± 26,3</li><li>Alle Patienten konnten nach 4 Stunden Bettruhe problemlos mobilisiert werden.</li></ul> Sicherheitsergebnisse <ul style="list-style-type: none"><li>49/50 (98 %) frei von vaskulären Komplikationen bis zur Entlassung aus dem Krankenhaus</li><li>Mittlere Zeit bis zur Entlassung: 2,6 Tage</li><li>1/50 (2 %) leichte Blutungen am nächsten Tag nach ereignisloser Mobilisation am Tag der Angiographie</li></ul> |

|--|--|--|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Die Studie aus dem Jahr 2006 wurde durchgeführt, um die Sicherheit und Wirksamkeit des aktuellen Produkts mit einem verbesserten Applikationssystem zu bestätigen und um Rückmeldungen zur Bedienungsanleitung des FemoSeal™ VCS und zum Schulungsprogramm zu erhalten. Die Studie umfasste 100 Patienten, und der primäre Endpunkt war, ob eine Hämostase erreicht wurde oder ob zusätzliche manuelle oder mechanische Maßnahmen zur Kompression erforderlich waren. Diese Studie kam zu dem Schluss, dass die Anwendung von FemoSeal™ VCS in den meisten Fällen erfolgreich war (sofortige Hämostase in 91 % der Fälle).

In die Studie aus dem Jahr 2008 wurden 50 Patienten aufgenommen, um die Sicherheit und Leistungsfähigkeit des FemoSeal™ VCS bei der Anwendung in der normalen klinischen Routine bei Patienten zu bewerten, die sich einer Herzkatheteruntersuchung mit einer 7Fr-Schleuse unterziehen. Der primäre Endpunkt der Studie war die Erhebung von Daten über die Zeit bis zur Hämostase und die Zeit bis zur Mobilisierung ohne zusätzliche manuelle oder mechanische Kompression. Die Studienergebnisse zeigten, dass die durchschnittliche Zeit bis zur Hämostase 57,8 Sekunden betrug und alle Patienten nach 4 Stunden Bettruhe mobilisiert werden konnten.

Die Studie aus dem Jahr 2009 sollte die neue Verpackung des FemoSeal™ VCS evaluieren. Dazu wurden 25 Patienten in die Studie aufgenommen. Der primäre Endpunkt war, ob der Benutzer Probleme mit der Verpackung hatte. Die Benutzer stellten keine Probleme mit der neuen Verpackung des FemoSeal™ VCS fest. In dieser Studie wurden auch Daten für die Zeit bis zur Hämostase erhoben.

Im Rahmen der Studie im Jahr 2022 sollten Daten zur Sicherheit und Wirksamkeit des FemoSeal VCS bei der Erzielung der Hämostase von Zugangsstellen zur A. femoralis communis (CFA) bei Patienten, die sich perkutanen endovaskulären Eingriffen unterziehen, proaktiv erfasst werden. Dazu wurden 230 Patienten in die Studie aufgenommen. Die primären Endpunkte für das Register sind der Erfolg des Eingriffs (d. h. erfolgreiche Hämostase an der Punktionsstelle) und die Reduzierung schwerwiegender Komplikationen (z. B. Gefäßverletzungen, Blutungen an der Zugangsstelle, Infektionen an der Zugangsstelle, wiederholte manuelle Kompression und neue ipsilaterale akute Beinischämie an der Zugangsstelle). Die Schlussfolgerung aus der Studie war, dass das FemoSeal™ VCS in der Praxis gut funktioniert und eine effektive Hämostase sowie niedrige Raten von Komplikationen an der Zugangsstelle für Patienten ermöglicht, die sich peripheren endovaskulären Eingriffen unterziehen. Es konnte eine gute Leistung mit kurzer Zeit bis zur Hämostase festgestellt werden, und die Rückmeldungen der Benutzer zur Gebrauchstauglichkeit waren positiv, was FemoSeal™ VCS zu einem wertvollen Produkt zum Verschluss des femoralen Zugangs macht.

### 1.4.3 Zusammenfassung der Daten aus klinischen Nachbeobachtungsstudien nach dem Inverkehrbringen

#### 1.4.3.1 Abgeschlossene Aktivitäten der klinischen Nachbeobachtung nach dem Inverkehrbringen

Eine Zusammenfassung der abgeschlossenen klinischen Nachbeobachtungen nach dem Inverkehrbringen ist in **Tabelle 1.7** unten beschrieben.

**Tabelle 1.7. Klinische Nachbeobachtungen nach dem Inverkehrbringen**

| Abgeschlossene klinische Nachbeobachtungsaktivitäten nach dem Inverkehrbringen |             |                                                                              |                                                                                                                                                                                                          |                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Die Terumo Medical Corporation hat im laufenden Berichtszeitraum (01. September 2019 – 31. August 2024) drei hochwertige Umfragen unter Ärzten durchgeführt.

In den klinischen FemoSeal™ Umfragen wurden proaktiv klinische Daten in Bezug auf die Sicherheit und Leistung des FemoSeal™ VCS während der klinischen Verwendung erhoben. Die Umfrage umfasste Fragen zum gesamten Produkt und zu seinem Zubehör, einschließlich des 0,038-Zoll-Führungsdrahts, sowie zu deren direkter Interaktion. In den klinischen Umfragen zum Führungsdraht wurden proaktiv klinische Daten in Bezug auf Sicherheit und Leistung während der klinischen Verwendung des 0,038-Zoll-Führungsdrahts erfasst, der mit dem FemoSeal™ VCS geliefert wird. Die Fragen konzentrierten sich speziell auf die allgemeine Verwendung des Führungsdrahtes, von der Einführung durch die Prozedurschleuse in das Gefäßsystem bis zur Entfernung des Drahts.

Das FemoSeal™ VCS und der 0,038-Zoll-Führungsdraht, der dem Produkt beiliegt, erhielten beide akzeptable Bewertungen. Basierend auf der Auswertung der Kommentare aus den hochwertigen klinischen Umfragen wurden sechs (6) Reklamationen des Produkts und neun (9) Nichtbeanstandungen des Führungsdrahts eingereicht. Die Reklamationen wurden sowohl für FemoSeal als auch für den Führungsdraht ausgewertet und im Rahmen der Überwachung nach dem Inverkehrbringen durch Terumo beurteilt. Es wurden keine neuen Risiken und/oder Risikostufen identifiziert.

Im Rahmen der PMCF-Aktivitäten wurde 2024 eine Umfrage bei Ärzten durchgeführt. Die Ergebnisse der Umfrage zeigten, dass die Leistungsbewertung und Sicherheit des FemoSeal™ VCS insgesamt sehr positiv ausfielen. Die Kompatibilität anderer Führungsdrähte als des standardmäßig mit dem FemoSeal™ VCS gelieferten wurde ebenfalls nachgewiesen.

#### 1.4.3.2 Laufende/geplante klinische Nachbeobachtung nach dem Inverkehrbringen

TMC hat eine laufende/geplante klinische Nachbeobachtungsstudie nach dem Inverkehrbringen. Eine klinische Umfrage wird durchgeführt, um prospektiv Rückmeldungen in Bezug auf die Verwendung des Führungsdrahts mit FemoSeal VCS zu erfassen, der auf dem EU-Markt vertrieben wird. Die Umfrage wird von den Ärzten ausgefüllt, um zu untersuchen, welche Führungsdrähte sie während des Eingriffs verwendet haben. Fehlende Literatur und Kommentare externer Prüfer zur Kompatibilität des FemoSeal™ VCS mit der Verwendung anderer Führungsdrähte von Nicht-Terumo-Marken wurde als Lücke identifiziert, die mit dieser Umfrage geschlossen werden soll. Die Rückmeldungen beziehen sich unter anderem auf technische Ergebnisse und auf die klinische Leistung und Sicherheit bei der Verwendung des Produkts mit verschiedenen Führungsdrähten.

#### 1.4.4 Zusammenfassung der Daten aus der systematischen Literaturrecherche

Die Terumo Medical Corporation führt systematische Literaturrecherchen durch, um klinische Sicherheits- und Leistungsdaten aus veröffentlichten Studien zum FemoSeal™ VCS und/oder ähnlichen Produkten zu erfassen und zu bewerten. Ziel der jährlichen Prüfung der veröffentlichten Literatur ist es, zuvor unbekannte Nebenwirkungen zu ermitteln, bekannte Nebenwirkungen zu überwachen, entstehende Risiken zu ermitteln und eine mögliche systematische fehlerhafte oder zulassungsüberschreitende Verwendung des FemoSeal™ VCS festzustellen.

Bei der jüngsten systematischen Literaturrecherche, die den Zeitraum vom 1. September 2019 bis zum 31. August 2024 abdeckt, wurden 29 veröffentlichte Studien ermittelt, die klinische Daten zur Sicherheit und Leistung des FemoSeal™ VCS lieferten. In dreiundzwanzig Referenzen wurde ein On-Label-Gebrauch des FemoSeal™ VCS aufgeführt, in neun Studien ein Off-Label-Gebrauch gemeldet. Insgesamt zeigt die Literaturlauswertung über Studien, die sich speziell mit der Verwendung des FemoSeal™ VCS befassen, dass die untersuchte Population repräsentativ für Patienten in der EU ist, die sich perkutanen Gefäßkathetereingriffen unterziehen. Eine Liste dieser 23 nach dem Peer-Review-Verfahren überprüften On-Label-Anwendungen finden Sie in **Abschnitt 3**.

Die klinische Leistung wurde anhand der folgenden Kriterien bewertet:

- Die Zeit bis zur Hämostase ist besser als oder vergleichbar mit dem Stand der Technik für den perkutanen Verschluss der A. femoralis communis.
- Die Zeit bis zur Mobilisierung ist besser als oder vergleichbar mit dem Stand der Technik für den perkutanen Verschluss der A. femoralis communis.
- Die Rate postoperativer Komplikationen ist im Vergleich zum aktuellen Versorgungsstandard ähnlich hoch oder niedriger.

Auf der Grundlage dieser klinischen Leistungsdaten haben die Daten dieser Literaturlauswertung gezeigt, dass das FemoSeal™ VCS erfolgreich zum Verschließen der femoralen Arterienpunktion

(Arteriotomie) bei Patienten eingesetzt werden kann, die sich einer perkutanen Katheterisierung unter Verwendung einer 7Fr-Prozedurschleuse (oder kleiner) unterzogen haben. Die vollständige Hämostase wurde bei der Mehrheit der Patienten (79,65–100 %) erreicht und war mit einer medianen Zeit bis zur Hämostase von 0,5 Minuten und einer mittleren Zeit bis zur Entlassung von 3 Tagen verbunden. Zwischen 69,2 und 86,7 % der Patienten konnten 5 Stunden nach dem Verschluss umherlaufen, bei einer mittleren postoperativen Liegezeit von 349 Minuten. Ein Versagen des FemoSeal™ VCS wurde in 3,68–4 % der Fälle beobachtet, und bei 0,9–4,4 % der Eingriffe war zusätzliche manuelle Kompression erforderlich.

Die klinische Sicherheit wurde anhand unerwünschter Ereignisse bewertet, einschließlich, aber nicht beschränkt auf:

- Blutung
- Hämatom
- Pseudoaneurysma
- Hämatom
- Arteriovenöse Fistel
- Infektion
- Tod

Im Hinblick auf jedes dieser unerwünschten Ereignisse war die Häufigkeit des Auftretens bei FemoSeal™ VCS in den eingeschlossenen Studien geringer oder vergleichbar mit den in der Vergangenheit berichteten Raten für manuelle Kompression und andere Gefäßverschlussprodukte.

Bei der Überprüfung von zehn Fallberichten wurden keine unerwünschten Ereignisse festgestellt, da keine neuen, unerwarteten, neu auftretenden oder unannehmbaren Risiken identifiziert wurden.

Die Gesamtwirksamkeit der Verwendung des FemoSeal™ VCS während einer diagnostischen Angiographie oder interventionellen Operation hängt von mehreren Faktoren ab, wie z. B. Geschlecht, Alter, Anatomie des Patienten, Begleiterkrankungen, anatomische Platzierung der Punktionsstelle, Erfahrung des Chirurgen, VCD-Platzierungsmethode, postoperative Versorgung, usw. Neben dem Verschlusserfolg, einschließlich des Erreichens der Hämostase, bot FemoSeal™ VCS klinische Vorteile im Vergleich zum Gefäßverschluss nach der Punktierung der Oberschenkelarterie, wie z. B. verkürzte Zeit bis zur Hämostase und verkürzte Zeit bis zur Mobilisierung. Die Ergebnisse in Bezug auf die Leistung des FemoSeal™ VCS entsprechen denen, die bei bestimmungsgemäßer Verwendung für diesen Produkttyp zu erwarten sind. Einige der während des aktuellen Suchzeitraums abgerufenen Referenzen zeigten die Verwendung des Prüfprodukts an einer anderen anatomischen Stelle als der A. femoralis communis und zum Verschluss von Arteriotomien > 7 Fr, was als Off-Label gilt.

Während der Überprüfung wurden keine unbekannten Nebenwirkungen, neu auftretenden Risiken oder mögliche systematische fehlerhafte Verwendungen des Produkts festgestellt. Wenn das FemoSeal™ VCS jedoch von geschulten Ärzten mit Sorgfalt verwendet wird, funktioniert das Medizinprodukt als nützliches und notwendiges klinisches Gerät. Insgesamt erfüllt die Zieltherapie und damit das FemoSeal™ VCS den derzeit bestehenden klinischen Bedarf bei der Behandlung von Komplikationen im Zusammenhang mit dem Gefäßzugang.

Insgesamt ergaben die Daten dieser Literaturlauswertung keine bisher unbekannten Leistungs- oder Sicherheitsprobleme im klinischen Umfeld oder unerwünschte Wirkungen, die häufiger als erwartet/akzeptabel auftraten. Daher kann aus dieser Literaturlauswertung geschlossen werden, dass das FemoSeal™ VCS, wenn es zur Kompression für die Hämostase an der Arteriotomie nach perkutaner Katheterisierung verwendet wird, weiterhin die erwartete Leistung erbringt und nicht mit schwerwiegenden Sicherheitsereignissen verbunden ist.

#### **1.4.5 Zusammenfassung der Daten aus der Überwachung nach dem Inverkehrbringen**

Ein proaktives System zur Überwachung nach dem Inverkehrbringen ist vorhanden, und eine Prüfung aller Beschwerden wird monatlich und in Übereinstimmung mit den internen Herstellungsverfahren durchgeführt. Die Beschwerdendaten wurden im Zeitraum vom 1. September 2019 bis zum 31. August 2024 analysiert. Insgesamt wurden 28 MDV-Berichte (Medical Device Vigilance) und 476 Kundenreklamationen an den Hersteller übermittelt. Von den 28 MDV-Meldungen betrafen 27 unerwünschte Ereignisse und eine eine Fehlfunktion des Produkts. Während des Berichtszeitraums gab es zwei Todesfälle, aber keiner der gemeldeten Todesfälle wurde als mit dem Prüfprodukt zusammenhängend beurteilt. Von den 476 Reklamationen an den Hersteller waren die häufigsten Reklamationsgründe Probleme beim Platzieren (146 Vorkommnisse, 0,0142 % Häufigkeitsrate). „Fehlermöglichkeiten beim Herausziehen“ wird mit einer Rate von 0,0126 % (130 Ereignisse) am zweithäufigsten genannt.

Das FemoSeal™ Vascular Closure System wurde weltweit über 1.030.136 Mal und im europäischen Wirtschaftsraum über 827.843 Mal verkauft. Die berechnete Häufigkeit von Reklamationen auf Grundlage des Gesamtumsatzes beträgt 0,046 %. Insgesamt ist die Reklamationsquote durch Kunden sehr gering. Es wurden keine neuen Risiken identifiziert, die nicht in der Bedienungsanleitung und Risikodokumentation enthalten sind.

Die Häufigkeit des Auftretens der unerwünschten Nebenwirkungen ist in **Tabelle 1.2** dargestellt. Es wurden keine neuen unerwarteten, neu entstehenden oder unververtretbaren Risiken durch diese Reklamationen identifiziert. Es gab keinen signifikanten Anstieg der Häufigkeit oder des Schweregrads bekannter unerwünschter Nebenwirkungen.

#### 1.4.6 Allgemeine Zusammenfassung der klinischen Leistung und Sicherheit

FemoSeal™ VCS ist für den Einsatz beim Verschluss der A. femoralis communis (Arteriotomie) bei perkutanen Katheterisierungen mit einer 7F-Einführschleuse (2,33 mm oder kleiner) indiziert. Diese klinische Bewertung basiert auf einer umfassenden Analyse der verfügbaren klinischen Daten und Literatur vor und nach dem Inverkehrbringen, die für die vorgesehene Verwendung des FemoSeal™ VCS relevant sind.

Eine umfassende Überprüfung der veröffentlichten Literatur wurde für den Zeitraum vom 1. September 2019 bis zum 31. August 2024 durchgeführt. Die Evidenz umfasste 29 Studien für das FemoSeal™ VCS. Die in der klinischen Bewertung enthaltenen Nachweise lassen darauf schließen, dass das Prüfprodukt bei bestimmungsgemäßer Verwendung sicher und wirksam ist und dass alle Risiken oder unerwünschten Nebenwirkungen, die mit dem Produkt unter normalen Verwendungsbedingungen verbunden sein können, akzeptable Risiken darstellen, wenn die Vorteile für den Patienten abgewogen werden. Die Ergebnisse in Bezug auf die Leistung der Prüfprodukte entsprechen denen, die bei bestimmungsgemäßer Verwendung für diesen Produkttyp zu erwarten sind.

Zu den potenziellen unerwünschten Nebenwirkungen, die mit der Verwendung von FemoSeal™ VCS verbunden sind, gehören die unerwünschten Ereignisse, die häufig bei alternativen Methoden des Arterienverschlusses berichtet werden, z. B. Blutungen und Hämatome. Insgesamt ähneln die Häufigkeiten der unerwünschten Ereignisse, die bei der Verwendung von FemoSeal™ VCS gemeldet wurden, den Raten, die bei der manuellen Kompression und ähnlichen Gefäßverschlussverfahren gemeldet wurden. Insbesondere bei Blutungen und Hämatomen liegen die berichteten Raten beim FemoSeal™ VCS unter den berichteten Raten für ähnliche Gefäßverschlussverfahren. Jedes der gemeldeten unerwünschten Ereignisse, sowohl aus der veröffentlichten Literatur als auch aus der Überwachung nach dem Inverkehrbringen, war zuvor identifiziert worden (siehe **Abschnitt 1.3**).

Die vorhandenen Daten zur klinischen Sicherheit und Leistung des FemoSeal VCS deuten darauf hin, dass der Nutzen des Gefäßverschlusses für den Patienten gegenüber möglichen Risiken überwiegt, wenn es in Übereinstimmung mit der Bedienungsanleitung verwendet wird.

Wie in den vorherigen Abschnitten angegeben, zeigen die für das FemoSeal™ VCS bereitgestellten Daten die Übereinstimmung zwischen den Daten in Bezug auf das zu bewertende Produkt (z. B. Verwendung des Produkts, Ergebnisse in Bezug auf Sicherheit, klinische Leistung und klinischer Nutzen), ermittelte gleichwertige Produkte und die Daten in Bezug auf ähnliche Produkte, die im Stand der Technik aufgeführt sind.

Die Kreuzanalyse der Sicherheitsdaten ergab keine Lücken zwischen:

- im Stand der Technik erwähnten Daten,
- für das zu bewertende Produkt spezifischen Daten,

- in der/den Risikomanagementdatei(en) erwähnten Daten,
- in der Kennzeichnung und/oder Gebrauchsanweisung erwähnten Daten (d. h. man befasst sich mit den dem Benutzer zu übermittelnden Restrisiken).

Die klinische Sicherheit wurde nachgewiesen durch die niedrigen Komplikationsraten, die in der nach dem Peer-Review-Verfahren überprüften klinischen Fachliteratur, den vom Unternehmen gesponserten klinischen Studien, der Überprüfung der Daten nach dem Inverkehrbringen ermittelt wurden, sowie die Tatsache, dass es keine Marktrücknahmen gab. Es wurden keine Bedenken hinsichtlich der Leistung festgestellt. Die überprüfte Literatur enthielt eine Verwendung des FemoSeal™ VCS, die dem Verwendungszweck des Herstellers entsprach.

### **1.5 Mögliche diagnostische oder therapeutische Alternativen**

Traditionell wird die manuelle Kompression angewandt, um nach Gefäßkatheterisierungen eine Hämostase an der Arteriotomiestelle zu erreichen. Die manuelle Kompression ist mit einer langen Immobilisierung des Patienten (bis zu 8 Stunden nach einem Eingriff) sowie mit erheblichen Beschwerden und einem längeren Krankenhausaufenthalt verbunden. Eine kürzlich durchgeführte systematische Auswertung ergab, dass die mediane Zeit bis zur Hämostase bei manueller Kompression 20,8 Minuten beträgt.<sup>1</sup>

Zu den Alternativen zur manuellen Kompression gehören externe hämostatische Vorrichtungen, die eine mechanische Kompression auf die Arteriotomiestelle ausüben. Diese Vorrichtungen verkürzen nicht die Zeit bis zur Hämostase oder zur Mobilisierung, sondern reduzieren den Personalbedarf, indem sie die manuelle Kompression durch eine mechanische Kompression ersetzen. Unerwünschte Ereignisse im Zusammenhang mit einer mechanischen Kompression sind ähnlich wie bei der manuellen Kompression.

Gefäßverschlussvorrichtungen wie FemoSeal™ VCS sind für den Verschluss nach einer Arteriotomie vorgesehen. Sie zielen darauf ab, die Zeit bis zur Hämostase zu verkürzen und eine frühere Mobilisierung zu ermöglichen. Eine kürzlich durchgeführte systematische Auswertung, bei der 13 im Handel erhältliche Produkte berücksichtigt wurden, ergab, dass die mediane Zeit bis zum Erreichen der Hämostase mit einem Gefäßverschlussprodukt 5,4 Minuten beträgt. Die mediane Hämostasezeit für die einzelnen Gefäßverschlussvorrichtungen lag zwischen 1 Minute (FemoSeal™ VCS) und 14 Minuten, wobei die Mehrzahl der Produkte zwischen 4 und 10 Minuten lag.<sup>1</sup>

Häufig gemeldete unerwünschte Ereignisse im Zusammenhang mit dem Verschluss der Arteriotomiestelle – mithilfe manueller Kompression, externer hämostatischer Vorrichtungen oder Gefäßverschlussvorrichtungen – sind unter anderem: Hämatome, Blutungen an der Zugangsstelle, Pseudoaneurysmen, arteriovenöse Fisteln und Infektionen. Dieselbe systematische Auswertung (34 randomisierte kontrollierte Studien, 14.401 Patienten) ergab, dass die Rate der unerwünschten Ereignisse zwischen der manuellen Kompression und der

Verwendung von Gefäßverschlussvorrichtungen ähnlich ist, mit der Ausnahme, dass die Blutungswahrscheinlichkeit bei Gefäßverschlussvorrichtungen tendenziell etwas höher ist.<sup>1</sup>

## 1.6 Empfohlenes Anwenderprofil und Schulung

Vorgesehene Anwender des FemoSeal™ Vascular Closure Systems sind Ärztinnen und Ärzte mit der erforderlichen Qualifizierung, um arterielle Zugänge und Verschlüsse bei endovaskulären Eingriffen über die A. femoralis communis herstellen zu dürfen, die an einem ärztlichen FemoSeal™ Schulungsprogramm der Terumo Medical Corporation teilgenommen haben.

## 1.7 Einschlägige vereinheitlichte und gemeinsame Normen

| Standardreferenz | Aktuelles Jahr der Konformität/Rev. | Beschreibung                                                                                                                             |

La guía resumen de seguridad y rendimiento clínico (SSCP) tiene por objeto proporcionar acceso público a un resumen actualizado de los principales aspectos de seguridad y rendimiento clínico del FemoSeal™ Vascular Closure System (VCS).

A continuación, se ofrece un resumen de la seguridad y el rendimiento clínico del dispositivo, destinado a usuarios/profesionales sanitarios en la **sección 1.0**.

## **1.0 RESUMEN PARA USUARIOS/PROFESIONALES SANITARIOS**

La SSCP no pretende sustituir las instrucciones de uso, que son el documento principal para garantizar el uso seguro del producto, ni pretende proporcionar sugerencias de diagnóstico o tratamiento a los usuarios o pacientes previstos. La SSCP no pretende sustituir la información obligatoria de las tarjetas del implante ni de ningún otro documento obligatorio.

### **1.1 Uso previsto del producto**

#### **1.1.1 Uso previsto**

El FemoSeal™ Vascular Closure System es un producto sanitario indicado para cerrar una punción arterial después de un cateterismo percutáneo a través de la arteria femoral común.

#### **1.1.2 Indicaciones de uso**

El FemoSeal™ Vascular Closure System está indicado para cerrar la punción femoral habitual (arteriotomía) en pacientes que se hayan sometido a cateterismo percutáneo con una vaina quirúrgica de 2,33 mm (7F) o menor.

#### **1.1.3 Contraindicaciones y/o limitaciones**

El FemoSeal™ Vascular Closure System está contraindicado en pacientes con arteriotomías en las que se hayan utilizado vainas o dispositivos con un tamaño superior a 2,33 mm (7F).

#### **1.1.4 Poblaciones de pacientes objetivo**

La seguridad y eficacia del FemoSeal™ Vascular Closure System se ha establecido en pacientes de 18 años o más que se hayan sometido a cateterismo percutáneo con una vaina quirúrgica de 2,33 mm (7F) o menor.

#### **1.1.5 Poblaciones especiales de pacientes**

No se ha establecido la seguridad y eficacia del FemoSeal™ Vascular Closure System en las siguientes poblaciones de pacientes:

- Pacientes con enfermedad autoinmune preexistente
- Pacientes sometidos a trombolisis terapéutica
- Pacientes con enfermedad vascular periférica clínicamente significativa
- Pacientes con hipertensión no controlada ( $>220$  mmHg sistólica o  $>110$  mmHg diastólica)
- Pacientes con un trastorno hemorrágico, incluida trombocitopenia ( $<100\,000$  recuento de plaquetas) o anemia (Hgb  $<10$  mg/dl)

- Pacientes con un lumen interior de la arteria femoral común inferior a 5 mm
- Pacientes con insuficiencia renal o hepática
- Pacientes con otra comorbilidad relevante
- Población con orígenes raciales y/o étnicos específicos
- Pacientes con infarto de miocardio en las 72 horas siguientes
- Pacientes con injerto vascular o endoprótesis en el punto de punción
- Pacientes embarazadas o en periodo de lactancia
- Pacientes menores de 18 años

#### 1.1.6 Usuarios previstos

Los usuarios previstos del FemoSeal™ Vascular Closure System son médicos con formación que les permite realizar el acceso arterial y el cierre para procedimientos endovasculares a través de la arteria femoral común y han participado en un programa de formación médica FemoSeal™ de Terumo Medical Corporation.

## 1.2 Descripción del producto

### 1.2.1 Descripción del producto

El FemoSeal™ Vascular Closure System, fabricado por Terumo Medical Corporation (TMC), es un dispositivo de cierre vascular reabsorbible diseñado para lograr la hemostasia arterial femoral después de la cateterización percutánea a través de la arteria femoral común.

Los elementos de cierre FemoSeal™ constan de dos discos de polímero reabsorbible, la junta interior y el disco de bloqueo exterior, que se mantienen unidos mediante un multifilamento reabsorbible, así se sella mecánicamente la arteriotomía (consulte las **figuras 1.1 y 1.2**). Después de desplegarse a través de la vaina de la carcasa del cono, el disco de bloqueo exterior se apisona sobre el eje multifilamento, lo que resulta en el cierre mecánico del punto de punción entre el disco de bloqueo interior y exterior. La junta interior y el disco de bloqueo exterior se mantienen en su lugar mediante fricción en el eje multifilamento. La hemostasia se consigue por medios mecánicos. Los elementos de cierre se degradan por hidrólisis.

Los componentes de cierre implantables, la junta interior y el disco de bloqueo exterior se degradan en dieciocho (18) meses, mientras que se estima que el tejido circundante degrada y absorbe el multifilamento por hidrólisis después de entre dos (2) y tres (3) años. La capacidad de los componentes de cierre implantables para mantener la compresión en la arteriotomía se ha probado hasta ocho (8) horas. Los productos de degradación se metabolizan y se excretan en la orina o se

espiran como dióxido de carbono a través de los pulmones. No se han observado efectos de acumulación en estudios con animales. Los componentes adicionales de FemoSeal™ que entrarán en contacto con tejido vivo o sangre durante el procedimiento son la vaina de la carcasa del cono, el dilatador, el tubo de presión, el empujador y la guía.

**Figura 1.1 Junta interior y disco de bloqueo exterior, respectivamente**

**Figura 1.2 Junta interior y disco de bloqueo exterior desplegados**

La unidad FemoSeal™ se suministra junto con un dilatador y una guía de 0,97 mm (0,038 in) de diámetro externo, 70 cm (27,5 in) de longitud y un enderezador en J. Consulte la **figura 1.3**. La guía está contenida dentro de un tubo de polietileno. Todas las piezas se embalan en una bandeja de papel fija. El envase también incluye la tarjeta del implante del paciente. El FemoSeal™ Vascular Closure System no requiere accesorios adicionales para que el producto funcione según lo previsto y solo está diseñado para su uso con el dilatador y la guía incluidos en el envase del producto.

**Figura 1.3 Unidad FemoSeal™ VCS con guía y dilatador**

### 1.2.2 Materias primas y componentes

En la **tabla 1.1** se enumeran los componentes del FemoSeal™ VCS.

**Tabla 1.1 Materias primas y componentes de FemoSeal™ VCS**

\*Parte implantable del producto; los componentes implantables son seguros para RM

El FemoSeal™ VCS se esteriliza mediante óxido de etileno (OE) y es un producto sanitario de un solo uso. El dispositivo FemoSeal™ VCS está diseñado de tal manera que no se puede reutilizar.

### **Modo de funcionamiento**

El FemoSeal™ VCS promueve la hemostasia mecánica mediante el despliegue de elementos de cierre implantables dentro y fuera de la arteria femoral común. El mecanismo que evita la hemorragia lo proporciona la junta interior, que sella el punto de punción, y el disco de bloqueo exterior, que mantiene la junta interior en su posición.

#### **1.2.3 Beneficio clínico**

El FemoSeal™ VCS proporciona los siguientes beneficios clínicos en relación con el cierre vascular después de insertar una punción femoral común:

- Reducción del tiempo de hemostasia<sup>1</sup>
- Reducción del tiempo de deambulación<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R. y Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32-44.

#### 1.2.4 Generaciones o variantes anteriores

- La primera versión de FemoSeal™ VCS (n.º 11200) se vendió en el mercado europeo durante el año 2005 y parte de 2006.
- El actual FemoSeal™ VCS (n.º 11202), con un sistema de distribución mejorado, lleva en el mercado desde el 28 de marzo de 2006.

#### 1.2.5 Accesorios diseñados para su uso en combinación con el producto

La unidad FemoSeal™ se suministra con un dilatador, una guía de 0,97 mm (0,038 in) de diámetro externo y 70 cm (27,5 in) de longitud y un enderezador en J. La guía es un accesorio de la unidad FemoSeal™. El enderezador en J es un componente de la guía, mientras que el dilatador es un componente de la unidad FemoSeal™. La guía es el único accesorio considerado. La guía está contenida dentro de un tubo de polietileno. Todas las piezas se embalan en una bandeja de papel fija. El envase también incluye la tarjeta del implante del paciente. El FemoSeal™ Vascular Closure System no requiere accesorios adicionales para que el producto funcione según lo previsto y solo está diseñado para su uso con el dilatador y la guía incluidos en el envase del producto.

#### 1.2.6 Otros dispositivos y productos previstos para su uso en combinación con el dispositivo

El FemoSeal™ VCS no requiere dispositivos adicionales para funcionar según lo previsto.

### 1.3 Riesgos y advertencias

#### 1.3.1 Riesgos residuales y efectos no deseados

Los acontecimientos adversos, daños y complicaciones conocidos o previsibles asociados con el uso del FemoSeal™ VCS como resultado del riesgo residual se enumeran en la **tabla 1.2**. La tasa de incidencia se basa en un análisis de la documentación de riesgos y se calcula en función de los datos de vigilancia posteriores a la comercialización desde el 1 de septiembre de 2019 hasta el 31 de agosto de 2024. No se conocen riesgos residuales para el FemoSeal™ VCS y todos los riesgos aplicables se han abordado mediante el suministro de las instrucciones de uso y el proceso de gestión de riesgos.

**Tabla 1.2. Acontecimientos adversos/complicaciones del FemoSeal**

| <b>Daño</b>                                           | <b>Tasa de incidencia (%)</b> | <b>Factores de mitigación</b>                                                                                                                                                                               |

### 1.3.2 Advertencias y precauciones

#### Advertencias

1. No lo utilice si el envase está dañado o si alguna barrera estéril no está intacta.
2. No lo utilice después de la fecha de caducidad, ya que es posible que los componentes biodegradables no funcionen correctamente.
3. No lo utilice si alguno de los elementos parece dañado o defectuoso.
4. El uso del FemoSeal™ Vascular Closure System en los casos en los que se haya producido contaminación bacteriana de la vaina quirúrgica o del tejido circundante puede provocar una infección.
5. Si se sospecha que se ha insertado la pared posterior de la arteria o que se ha realizado más de una punción arterial, no confíe únicamente en el FemoSeal™ Vascular Closure System para conseguir la hemostasia arterial. Utilice compresión manual o mecánica adicional.
6. Si el punto de punción se encuentra en la bifurcación de la arteria femoral o distal a ella, el FemoSeal™ Vascular Closure System no debe utilizarse debido al riesgo de que la junta interior se coloque de forma incorrecta. Este acontecimiento puede provocar hemorragias y/o interrumpir el flujo sanguíneo normal.
7. Si hay una hemorragia arterial persistente en el lugar de la incisión, no corte el multifilamento hasta lograr la hemostasia. Si no se logra la hemostasia, fije el multifilamento con un apósito estéril y aplique compresión suplementaria hasta lograr la hemostasia. En caso de hemorragia arterial persistente, pueden producirse complicaciones significativas del sangrado que podrían provocar lesiones en el paciente o su muerte.
8. No utilice el FemoSeal™ Vascular Closure System si el punto de punción está próximo al ligamento inguinal, ya que esto podría provocar un hematoma retroperitoneal.
9. Los pacientes con un mayor riesgo de hemorragia pueden sufrir una mayor pérdida de sangre y requerir una transfusión.
10. Si el disco interior se desprende, puede causar un evento trombótico y/o embólico.

#### Precauciones

1. El procedimiento de despliegue del FemoSeal™ Vascular Closure System debe ser realizado por médicos con la formación adecuada en el uso del producto.
2. Realice un angiograma femoral limitado o una punción femoral guiada por ecografía antes de desplegar el FemoSeal™ Vascular Closure System.
3. Interrumpa el procedimiento en los siguientes casos:

- Diámetro del lumen de la arteria femoral común <5 mm
  - Estenosis y/o placa significativa presente en las proximidades del punto de punción femoral común
  - Punción arterial insertada en la bifurcación de la arteria femoral o distal a ella
  - Ramas o vasos anómalos presentes cerca del punto de punción femoral común
4. Si existe un hematoma, se debe tener especial cuidado para la correcta inserción de la vaina del cono en la arteria.
  5. Utilice una técnica de punción de pared única. No perfora la pared posterior de la arteria.
  6. Observe la técnica estéril en todo momento cuando utilice el FemoSeal™ Vascular Closure System.
  7. El FemoSeal™ Vascular Closure System es de un solo uso y no se debe volver a esterilizar ni a utilizar de ninguna manera. La unidad FemoSeal™ está diseñada de tal manera que no se puede reutilizar.
  8. Si el despliegue de la junta interior encuentra una resistencia inesperada, interrumpa el procedimiento.
  9. Para desplegar correctamente la junta interior, vuelva a colocar el pulgar de modo que el botón pueda retroceder libremente.
  10. Asegúrese de que la punta de la vaina de la carcasa del cono de la unidad FemoSeal™ esté debajo de la superficie de la piel antes de desplegar el disco de bloqueo exterior. El disco de bloqueo exterior puede desplegarse involuntariamente por encima del nivel de la piel en pacientes con una distancia corta entre la arteria femoral y el nivel de la piel.
  11. Para un despliegue correcto, puede ser necesaria una incisión cutánea antes del despliegue.
  12. Si la junta interior está dentro de la arteria, pero no es posible presionar completamente el botón y desplegar el disco de bloqueo exterior, puede ser necesaria una cirugía para retirar los elementos de cierre FemoSeal™.
  13. Si fuera necesario volver a perforar la misma arteria femoral en un plazo de 18 meses, debe volver a practicarse la punción al menos un centímetro proximal al punto de acceso anterior del FemoSeal™ Vascular Closure System.
  14. Indique al paciente que siga las indicaciones del médico con respecto a la inspección del lugar de cierre.
  15. Indique al paciente que lleve consigo la tarjeta de información para el paciente durante los próximos 18 meses.

**Precauciones en el momento del alta**

Antes de considerar el alta, evalúe al paciente para detectar las siguientes condiciones clínicas:

- 1. Hemorragia y/o hematoma en el lugar de cierre
- 2. Dolor al caminar
- 3. Signos de infección en el lugar de cierre

**1.3.3 Acciones correctivas de seguridad**

Hubo una acción correctiva de seguridad relacionada con el FemoSeal™ VCS durante el periodo comprendido entre el 1 de septiembre de 2019 y el 31 de agosto de 2024.

En 2022, Terumo retiró voluntariamente el FemoSeal™ VCS debido a la existencia de quejas que alegaban fallos en las pruebas de proceso y liberación de lotes del producto FemoSeal fabricado por Elkton para la medición de la fuerza de compactación y la fuerza de retracción. Se retiraron un total de 950 unidades en Corea del Sur.

**1.4 Evaluación clínica y del seguimiento clínico posterior al lanzamiento**

La **tabla 1.3** incluye una lista de estudios fundamentales incluidos para introducir el FemoSeal™ VCS en el mercado, así como estudios posteriores a la comercialización y actividades de seguimiento clínico posteriores a la comercialización. La versión del dispositivo utilizada en el estudio se incluye en la siguiente tabla. La primera versión del FemoSeal™ VCS (n.º 11200) estuvo en el mercado hasta 2006, mientras que la siguiente versión (n.º C11202) se lanzó al mercado en 2006 y es la que está actualmente en el mercado.

**Tabla 1.3 Resumen de estudios fundamentales**

| Pruebas funcionales con animales previas a la comercialización                                                                                                                                                                                                          | Versión del dispositivo |

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Realizado por Biomatech, Francia | Estudio en animales | El propósito del estudio consistía en evaluar la biocompatibilidad y biofuncionalidad de un implante biodegradable diseñado para lograr la hemostasia en el sistema vascular. El dispositivo sometido a prueba estaba destinado a insertarse en el orificio perforado en las arterias para lograr la hemostasia. Un disco entró en el orificio insertado en la arteria y el otro apretó el disco interno desde el exterior de la arteria. Ambos discos se insertaron a través de una vaina introductora. Los discos se diseñaron para prevenir hemorragias, para curarse en la pared del vaso y finalmente degradarse y absorberse. El estudio se diseñó para recopilar y analizar datos | El periodo de implantación/seguimiento es de 5 semanas para todos los animales<br><br>4 ovejas, 1 cerdo<br><br>14 elementos de cierre<br><br>8 elementos de cierre implantados en 2 ovejas<br><br>2 elementos de cierre implantados en 1 cerdo<br><br>Cuando se implantaron dos elementos de cierre en la misma arteria femoral, se implantaron a una distancia >30 mm | Se registró todo criterio de signos adversos (inflamación, necrosis, hemorragia o cualquier otra lesión) y toda formación de capa pseudointimal delgada. Se prestó especial atención a la integración tisular inicial del dispositivo, con especial atención a la encapsulación interna del disco.<br><br>Macroscópicamente, no se observaron signos significativos de intolerancia local ni formación de trombos. La observación macroscópica no reveló ninguna diferencia entre la oveja o el cerdo después de la implantación de los elementos de cierre en las arterias femorales. Macroscópicamente, no se |

|  |  |  | después de la implantación funcional en ovejas y cerdos con el fin de evaluar la capacidad del implante para mantener la función fisiológica cuando se utiliza en el sistema circulatorio, determinar la respuesta del huésped y la respuesta del dispositivo (integridad física, encapsulación tisular en el sacrificio) y evaluar la degradación del implante. |  | <p>observaron signos significativos de intolerancia local ni formación de trombos. La observación macroscópica no reveló ninguna diferencia entre la oveja o el cerdo después de la implantación de los elementos de cierre en las arterias femorales.</p> <p>El análisis histopatológico del lugar de implantación en ovejas no mostró reacciones adversas locales. Los discos interior y exterior mostraron signos de degradación y, en algunos casos, se rompieron en partes más pequeñas. Los discos internos se integraron completamente en el tejido neointimal. En el cerdo, el análisis histopatológico mostró ligeramente más signos inflamatorios alrededor de los discos interiores y exteriores. En ambos animales, el multifilamento exhibió ligeramente más signos inflamatorios que en el material de disco, lo cual es normal para las suturas trenzadas debido a la mayor dimensión de la zona superficial.</p> <p>La permeabilidad del vaso se midió después de cinco semanas por medio del uso de tres métodos diferentes, histomorfométrico, histomorfométrico en combinación con la medición del diámetro del vaso por medio del uso del calibre y por medio del uso</p> |

|--|--|--|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Como parte del plan de desarrollo previo a la comercialización del FemoSeal™ VCS, se realizaron tres pruebas funcionales en animales. En el 2000, antes de iniciar los estudios clínicos, se realizó un estudio en animales para evaluar la biofuncionalidad del FemoSeal™ VCS. Este estudio evaluó la capacidad de los elementos de cierre para mantener la función fisiológica y evaluar su degradación. A los 18 meses, el material del disco interior y exterior ya no era visible, después de haber sido reemplazado con un tejido fibroso endoluminal. En conclusión, se confirmó la capacidad del elemento de cierre FemoSeal™ VCS para mantener la función fisiológica cuando se utiliza en el sistema circulatorio.

En 2002 se realizó un estudio en animales para evaluar la biocompatibilidad y biofuncionalidad de un implante biodegradable, FemoSeal™ VCS, diseñado para lograr la hemostasia en el sistema vascular. En resumen, la degradación del implante casi se completó a las 36 semanas y no hubo una reacción tisular adversa significativa.

Otro estudio en animales en 2002 evaluó la biocompatibilidad y biofuncionalidad de un implante biodegradable, FemoSeal™ VCS, diseñado para lograr la hemostasia en el sistema vascular. Después de 5 semanas, la encapsulación del disco se completó, y se observaron signos de degradación para los discos internos y externos. En conclusión, se confirmó la capacidad del implante para mantener la función fisiológica cuando se utilizó en el sistema circulatorio.

Como parte del plan de desarrollo clínico para el FemoSeal™ VCS, Radi Medical System AB llevó a cabo una investigación clínica previa a la comercialización. Esta investigación clínica no está publicada ni disponible en línea. El estudio con el dispositivo modelo n.º 11200 se llevó a

cabo en 2002-2004 según la norma europea EN 540 (Clinical Investigation of Medical Devices for Human Subjects) y de acuerdo con «ICH General Considerations for Clinical Trials and Guideline for Good Clinical Practice». Los detalles de este estudio se documentan en el informe EU-SE-001. El estudio clínico se documentó en el informe final de Radi Medical Systems AB, «Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures». El estudio clínico se realizó con el primer modelo n.º 11200 de FemoSeal™ y se centró en la seguridad y efectividad de los componentes de cierre implantables. La única diferencia entre el primer modelo n.º 11200 y el modelo actual (C11202) es el tamaño francés, 6F y 7F respectivamente, y el sistema de distribución mejorado. Los beneficios clínicos, el uso previsto, los fundamentos de la operación y las materias primas de los elementos de cierre implantables, el sellado interior y el disco de bloqueo exterior permanecen sin cambios.

El uso previsto del dispositivo fue para pacientes que se sometieron a procedimientos cardíacos de diagnóstico o intervencionistas en los que se utilizó la arteria femoral como punto de acceso. El objetivo de este estudio era determinar la seguridad, el rendimiento y la eficacia del FemoSeal™ VCS. Se trataba de un estudio prospectivo, multicéntrico, de un solo grupo, abierto y con seguimiento a los 30 días.

El criterio de valoración principal del rendimiento fue el tiempo hasta la hemostasia definido como la ausencia de hemorragia rápida. El criterio de valoración principal de la seguridad fue la incidencia de complicaciones vasculares importantes durante 30 días. Los criterios secundarios de valoración incluyeron el tiempo hasta la deambulación, la proporción de fracasos del tratamiento, la incidencia de eventos adversos y las características de rendimiento del dispositivo durante la dispensación y el despliegue.

Los pacientes incluidos en este estudio fueron adultos capaces de dar su consentimiento informado y con al menos un pulso pedio intacto. Los pacientes fueron excluidos del estudio si presentaban alguna de las siguientes afecciones:

- Antecedentes de enfermedad vascular periférica
- Enfermedad autoinmune
- Trastorno hemorrágico conocido de anemia grave
- INR >1,5
- Infarto de miocardio a las 72 horas
- Hipertensión no controlada a pesar del tratamiento
- Obesidad que impide el acceso con la técnica de Seldinger
- Presencia de injerto vascular o stent en el lugar de la arteriotomía

- Punción ipsilateral previa insertada en un plazo de 3 meses
- Esperanza de vida prevista <6 meses

Además, se examinó a los pacientes de forma intraoperatoria y se excluyeron del estudio si se observaba alguna de los siguientes síntomas:

- Diámetro del lumen de la arteria femoral común <5 mm
- Ramas arteriales a menos de 2 cm del punto de punción
- Estenosis significativa a menos de 3 cm del punto de punción
- Uso de la vaina introductora principal >6 F
- Punción en o distal a la bifurcación femoral
- Múltiples punciones femorales
- Punción conocida o sospechada de la pared femoral posterior
- Hematoma grande (2:6 cm) al finalizar el procedimiento
- Dificil inserción de la vaina primaria para el procedimiento debido a tejido tortuoso o vaso

Este estudio de protocolo único se llevó a cabo en dos partes: en la primera parte participaron 20 pacientes; a continuación, se completó un análisis de seguridad y luego participaron 60 pacientes adicionales durante la segunda parte.

En la primera parte, la edad media de los pacientes participantes era de 65,9 años, el 70,0 % de los pacientes eran varones y el 95 % de los pacientes tomaban medicamentos concomitantes.

En la segunda parte del estudio, la edad media era de 63,8 años, el 78 % eran varones y el 100 % tomaban medicamentos concomitantes.

Los pacientes que se sometieron a procedimientos de cateterización cardíaca de diagnóstico (parte 1 y parte 2) o de intervención (parte 2) fueron elegibles para la participación en el estudio. Los procedimientos cumplían con el estándar de atención en cada uno de los hospitales participantes, seguido del uso del FemoSeal™ VCS. Los datos de los pacientes se recogieron al inicio, durante el procedimiento, y transcurridos un día y 30 días después del procedimiento. Los resultados se resumen en la **tabla 1.5** e indican que FemoSeal™ VCS es seguro y eficaz para su uso en esta población de pacientes.

**Tabla 1.5 Resultados clínicos informados en un estudio previo a la comercialización**

|                                                                                                                       | Parte 1      | Parte 2                   |
|-----------------------------------------------------------------------------------------------------------------------|--------------|---------------------------|
| Número de pacientes                                                                                                   | 20           | 60                        |
| Tiempo medio hasta la hemostasia                                                                                      | 1,2 minutos  | 1,6 minutos <sup>a</sup>  |
| Tiempo medio hasta la deambulación                                                                                    | 72,2 minutos | 87,5 minutos <sup>b</sup> |
| Incidencia de complicaciones vasculares graves <sup>c</sup>                                                           | 0 (0 %)      | 1 (2 %)                   |
| Número de pacientes con efectos adversos                                                                              | 5 (25 %)     | 19 (32 %)                 |
| Fracaso del tratamiento (definida como complicaciones vasculares importantes, necesidad de compresión manual o ambas) | 0 (0 %)      | 3 (5 %)                   |
| Fallos en el funcionamiento del dispositivo                                                                           | 0 (0 %)      | 6 (10 %)                  |

<sup>a</sup> Basado en el tamaño total de la muestra de 58, porque dos pacientes no alcanzaron la hemostasia en el momento de la intervención debido a punciones ipsilaterales anteriores. La hemostasia se logró a los 7 minutos y 37 minutos para estos pacientes.

<sup>b</sup> Basado en el tamaño total de la muestra de 59: Un paciente no estaba incluido porque se le colocó el ventilador debido a un edema pulmonar y no pudo caminar durante más de una semana.

<sup>c</sup> Definido como complicación vascular que requiere transfusión de sangre o reparación quirúrgica, o infección local que requiere la administración de antibióticos, hospitalización o prolongación de la hospitalización o desbridamiento del sitio.

No se observaron complicaciones vasculares importantes en la parte 1 del estudio. Se notificó una complicación vascular grave en la parte 2 del estudio: pseudoaneurisma que se notificó en el plazo de un día tras la intervención. El acontecimiento requirió compresión guiada por ultrasonido y una inyección de trombina en el pseudoaneurisma y extendió la hospitalización del paciente.

De los cinco acontecimientos adversos notificados en la parte 1 del estudio, hubo un posible acontecimiento adverso relacionado con el dispositivo: un acontecimiento no grave de hemorragia rápida un día después del procedimiento. De los 19 acontecimientos adversos notificados en la parte 2 del estudio, se observaron tres acontecimientos adversos no graves relacionados con el dispositivo del hematoma, y se observaron seis posibles acontecimientos no

graves relacionados con el dispositivo, incluidos tres informes de exudado persistente, dos hematomas y dolor en una pierna después del ejercicio.

En la parte 2, tres pacientes fueron considerados fracasos del tratamiento: dos debido a la imposibilidad de lograr la hemostasia sin el uso de compresión y uno debido a la complicación vascular importante (pseudoaneurisma). No hubo fracasos del tratamiento en la parte 1 del estudio.

De los seis fallos de funcionamiento del dispositivo en la parte 2 del estudio, tres no interfirieron con el procedimiento, uno se atribuyó a un error del usuario, uno fue una fuga del introductor y otro fue una rotura de la unión del filamento. Los dos últimos problemas se abordaron con actualizaciones de modelos implementadas en C11202.

La parte 2 del estudio clínico previo a la comercialización no informó de los resultados del seguimiento de 6 meses debido al incumplimiento por parte de los pacientes. El estudio clínico previo a la comercialización (EU-SE-001) de 30 días, que coincide con el periodo de seguimiento de la bibliografía clínica, demuestra que FemoSeal™ VCS es seguro y eficaz.

### 1.4.2 Resumen de datos de estudios clínicos posteriores a la comercialización

En la **tabla 1.6** se describen cuatro estudios clínicos posteriores a la comercialización finalizados. Estas investigaciones clínicas no están publicada ni disponibles en línea.

**Tabla 1.6 Estudios clínicos posteriores a la comercialización**

| Estudios clínicos posteriores a la comercialización finalizados                                |              |                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                            |

El estudio de 2006 se llevó a cabo para confirmar la seguridad y eficacia del dispositivo actual con un sistema de distribución mejorado y para obtener información sobre las instrucciones de uso y el programa de formación de FemoSeal™ VCS. El estudio incluyó a 100 pacientes y el criterio de valoración principal era si se logró la hemostasia o si se necesitaban compresiones manuales o mecánicas adicionales. Este estudio concluyó que la aplicación de FemoSeal™ VCS tuvo éxito en la mayoría de los casos (el 91 % logró hemostasia inmediata).

En el estudio de 2008 se incluyeron a 50 pacientes para evaluar la seguridad y el rendimiento del FemoSeal™ VCS cuando se utilizaba durante la rutina clínica normal en pacientes sometidos a cateterismo cardíaco con una vaina de 7 F. El criterio de valoración principal del estudio consistió en recopilar datos sobre el tiempo hasta la hemostasia y el tiempo hasta la deambulación sin compresión adicional, manual o mecánica. Los resultados del estudio concluyeron que el tiempo medio de hemostasia era de 57,8 segundos y que todos los pacientes deambulaban después de 4 horas de reposo en la cama.

El estudio de 2009 debía evaluar el nuevo envase del FemoSeal™ VCS. En el estudio participaron 25 pacientes. El criterio de valoración principal fue si el usuario experimentó algún problema con el envase. Los usuarios no notaron ningún problema con el nuevo envase del FemoSeal™ VCS. Este estudio también recopiló datos sobre el tiempo necesario para lograr la hemostasia.

El objetivo del estudio de 2022 es recopilar de manera proactiva datos de la seguridad y eficacia del FemoSeal VCS para lograr la hemostasia de los sitios de acceso de la arteria femoral común (CFA) en sujetos del mundo real sometidos a procedimientos endovasculares percutáneos. En el estudio participaron 230 pacientes. Los criterios de valoración principales para el registro son el éxito del procedimiento (es decir, la hemostasia correcta del punto de punción) y la reducción de complicaciones importantes (por ejemplo, lesión vascular, hemorragia relacionada con el lugar de acceso, infección del lugar de acceso, compresión manual repetida e isquemia aguda ipsilateral de la pierna relacionada con el nuevo lugar de acceso). El estudio concluyó que el FemoSeal™ VCS funciona bien en entornos reales y proporciona una hemostasia eficaz y bajas tasas de complicaciones en el lugar de acceso para pacientes sometidos a intervenciones endovasculares periféricas. Demuestra un buen rendimiento con un tiempo corto hasta la hemostasia y una buena respuesta de uso por parte del operador, lo que convierte al FemoSeal™ VCS en un dispositivo valioso para el cierre del acceso femoral.

### 1.4.3 Resumen de datos del seguimiento clínico posterior a la comercialización

#### 1.4.3.1 Seguimiento clínico posterior a la comercialización finalizado

En la **Tabla 1.7** se describe un resumen de las actividades de seguimiento clínico posteriores a la comercialización completadas.

**Tabla 1.7. Actividades de seguimiento clínico posterior a la comercialización**

Terumo Medical Corporation ha completado tres encuestas de alta calidad a los usuarios médicos durante el periodo de notificación actual (del 1 de septiembre de 2019 al 31 de agosto de 2024).

Los estudios clínicos de FemoSeal™ recopilaban datos clínicos proactivos en relación con la seguridad y el rendimiento del FemoSeal™ VCS durante el uso clínico. La encuesta incluyó preguntas centradas en el dispositivo general y los accesorios asociados, incluida la guía de 0,038 in y sus interacciones directas. Los estudios clínicos sobre la guía recopilaban datos clínicos proactivos en relación con la seguridad y el rendimiento durante el uso clínico de la guía de 0,038 in suministrada con el FemoSeal™ VCS. Las preguntas de la encuesta se centraron específicamente en el uso general de la guía, que va desde la inserción a través de la vaina del procedimiento en la vasculatura hasta la extracción de la guía.

El FemoSeal™ VCS y la guía de 0,038 in incluidos con el dispositivo recibieron todas las clasificaciones aceptables y se presentaron seis (6) reclamaciones por el dispositivo y nueve (9) no-reclamaciones por la guía basadas en la evaluación de los comentarios recibidos de los estudios clínicos de alta calidad. Las reclamaciones se han evaluado tanto para el FemoSeal como para la guía y se han evaluado como parte del proceso de seguimiento posterior a la comercialización de Terumo. No se identificaron nuevos riesgos ni niveles de riesgo.

Se completó una encuesta a los usuarios médicos en 2024 como parte de las actividades de PMCF. Los resultados de la encuesta demostraron que la calificación de rendimiento y la seguridad de FemoSeal™ VCS eran muy favorables en general. También se demostró la compatibilidad de otras guías distintas a la estándar suministrada con FemoSeal™ VCS.

#### 1.4.3.2 Seguimiento clínico posterior al lanzamiento en curso o previsto

TMC tiene una actividad de seguimiento clínico posterior a la comercialización en curso/planificada. Se realizará una encuesta clínica para recopilar prospectivamente información relacionada con el uso de la guía con FemoSeal VCS distribuida en el mercado de la UE. Los médicos completarán la encuesta para estudiar qué guías utilizaron durante el procedimiento. El objetivo de esta encuesta es abordar una brecha identificada como la falta de documentación y comentarios de revisores externos sobre la compatibilidad de FemoSeal™ VCS con el uso de otras guías de marcas ajenas a Terumo. La información incluye los resultados técnicos, el rendimiento clínico y la seguridad relacionados con el rendimiento del dispositivo con diferentes guías.

#### 1.4.4 Resumen de los datos de la revisión bibliográfica sistemática

Terumo Medical Corporation lleva a cabo revisiones sistemáticas de la bibliografía para recopilar y evaluar datos clínicos de seguridad y rendimiento a partir de estudios publicados sobre el FemoSeal™ VCS o dispositivos similares. El objetivo del análisis anual de la bibliografía publicada es identificar efectos secundarios desconocidos anteriormente, supervisar los efectos secundarios conocidos, identificar riesgos emergentes e identificar un posible uso indebido sistemático o un uso fuera de indicación del FemoSeal™ VCS.

La revisión bibliográfica sistemática más reciente, que cubrió el periodo desde el 1 de septiembre de 2019 hasta el 31 de agosto de 2024, identificó 29 estudios publicados que proporcionaron datos de seguridad clínica y rendimiento sobre FemoSeal™ VCS. Veintitrés referencias informaron del uso de FemoSeal™ VCS según las indicaciones y en nueve estudios se informó del uso no contemplado. En general, la revisión bibliográfica de los estudios específicos para el uso del FemoSeal™ VCS muestra una población en estudio que es representativa de los pacientes de la UE sometidos a procedimientos de cateterización vascular percutánea. Consulte la **sección 3** para obtener una lista de estas 23 publicaciones del uso según las indicaciones revisadas por expertos.

El rendimiento clínico se evaluó mediante las siguientes medidas:

- El tiempo hasta la hemostasia es mejor o comparable al estado de la técnica para el cierre percutáneo de la arteria femoral común.
- El tiempo hasta la deambulación es mejor o comparable la tecnología de vanguardia para el cierre percutáneo de la arteria femoral común.
- La tasa de complicaciones posoperatorias es comparable o inferior a la de los estándares de atención actuales.

Basándose en estas mediciones de rendimiento clínico, los datos de esta revisión bibliográfica demostraron que FemoSeal™ VCS se puede utilizar con éxito para cerrar la punción femoral (arteriotomía) en pacientes sometidos a cateterización percutánea utilizando una vaina de procedimiento de 7 F o menor. La hemostasia completa se logró en la mayoría de los pacientes (79,65-100 %) de los casos y se asoció con un tiempo medio hasta la hemostasia de 0,5 min, tiempo medio hasta el alta de 3 días. Entre el 69,2 y el 86,7 % de los pacientes pudieron deambular 5 h después del cierre, con una media de reposo posoperatorio en la cama de 349 min. Se observó un fallo de FemoSeal™ VCS en el 3,68-4 % de los casos y se necesitó compresión manual adicional en el 0,9-4,4 % de los procedimientos.

La seguridad clínica se evaluó mediante acontecimientos adversos que incluyen, entre otros:

- Sangrado
- Hematomas
- Pseudoaneurisma

- Moratón
- Fístula arteriovenosa
- Infección
- Muerte

Para cada uno de estos acontecimientos adversos, la tasa de incidencia informada para el FemoSeal™ VCS en los estudios incluidos fue inferior o comparable a las tasas informadas históricamente para la compresión manual y otros dispositivos de cierre vascular.

No se identificaron acontecimientos adversos mediante la revisión de 10 informes del caso, ya que no se identificaron riesgos nuevos, imprevistos, emergentes o inaceptables.

La eficacia general del uso de FemoSeal™ VCS durante la angiografía diagnóstica o las intervenciones quirúrgicas depende de múltiples factores, como el sexo, la edad, la anatomía del paciente, las comorbilidades, la colocación anatómica del punto de punción, la experiencia del cirujano, el método de despliegue del VCD, el cuidado posoperatorio, etc. Además del éxito técnico, incluido el logro de la hemostasia, FemoSeal™ VCS ofreció beneficios clínicos en relación con el cierre vascular después de la punción arterial femoral, como la reducción del tiempo hasta la hemostasia y la reducción del tiempo hasta la deambulación. Los resultados de rendimiento de FemoSeal™ VCS son coherentes con los esperados para este tipo de dispositivo cuando se usa según lo previsto. Algunas de las referencias recuperadas durante el periodo de búsqueda actual mostraron el uso del dispositivo en cuestión en una ubicación anatómica distinta de la arteria femoral común y para el cierre de arteriotomías >7 Fr, lo que se considera no contemplado.

Durante la revisión no se identificaron efectos secundarios desconocidos, riesgos emergentes ni un posible uso indebido sistemático del dispositivo. Sin embargo, si FemoSeal™ VCS lo utilizan médicos formados con cuidado, el producto sanitario funciona como un dispositivo clínico útil y necesario. En general, la terapia objetivo y, por lo tanto, FemoSeal™ VCS aborda la necesidad clínica que existe actualmente en el tratamiento de las complicaciones relacionadas con el acceso vascular.

En general, los datos de esta revisión bibliográfica no detectaron ningún problema de rendimiento o seguridad en el entorno clínico que se desconocía previamente, ni efectos adversos que se produjeron a tasas superiores a las previstas/aceptables. Por lo tanto, a partir de esta revisión bibliográfica se puede concluir que el FemoSeal™ VCS, cuando se utiliza para proporcionar compresión para la hemostasia en la arteriotomía después del cateterismo percutáneo, sigue funcionando como se esperaba y no está asociado con eventos de seguridad graves.

#### **1.4.5 Resumen de datos de vigilancia posteriores a la comercialización**

Existe un sistema de PMS proactivo y se completa una revisión de todas las quejas mensualmente y de conformidad con los procedimientos de fabricación internos. Se analizaron los datos de las quejas durante el periodo comprendido entre el 1 de septiembre de 2019 y el 31 de agosto de 2024. En total, se presentaron 28 informes de vigilancia de productos sanitarios

(MDV) y 476 informes de reclamaciones de clientes al fabricante. De los 28 informes de MDV, 27 estaban relacionados con eventos adversos y uno con mal funcionamiento del dispositivo. Se produjeron dos muertes durante el periodo de notificación, pero ninguna de las muertes notificadas se consideró relacionada con el dispositivo en cuestión. Entre las 476 quejas presentadas al fabricante, los motivos más comunes de las quejas fueron las dificultades de implementación (146 incidencias, tasa de incidencia del 0,0142 %). El modo de fallo de los eventos de extracción es el segundo más frecuente con una tasa del 0,0126 % (130 eventos).

FemoSeal Vascular Closure System tiene más de 1 030 136 de ventas en todo el mundo y 827 843 en el Espacio Económico Europeo. La frecuencia calculada de las reclamaciones basadas en las ventas globales es del 0,046 %. La tasa global de reclamaciones de los clientes es muy baja. No se identificaron nuevos riesgos que no estén incluidos en las instrucciones de uso y la documentación de riesgos.

Las tasas de incidencia de los efectos secundarios no deseados se muestran en la **tabla 1.2**. No se identificaron nuevos riesgos imprevistos, emergentes o inaceptables mediante las reclamaciones. No hubo aumentos significativos en la frecuencia o la gravedad de los efectos secundarios no deseados conocidos.

#### **1.4.6 Resumen general del rendimiento clínico y la seguridad**

El FemoSeal™ VCS está indicado para cerrar la punción femoral habitual (arteriotomía) en pacientes que se hayan sometido a cateterismo percutáneo con una vaina quirúrgica de 2,33 mm (7 F) o menor. Esta evaluación clínica se basa en un análisis exhaustivo de los datos clínicos y la bibliografía disponibles antes y después de la comercialización relevantes para el uso previsto del FemoSeal™ VCS.

Se llevó a cabo una revisión exhaustiva de la bibliografía publicada durante el periodo comprendido entre el 1 de septiembre de 2019 y el 31 de agosto de 2024. El conjunto de pruebas incluyó 29 estudios para el FemoSeal™ VCS. La evidencia proporcionada en la evaluación clínica concluye que, cuando se utiliza del modo indicado, el dispositivo en cuestión es seguro y eficaz y cualquier riesgo o efecto secundario no deseado, que pueda asociarse con el dispositivo en condiciones normales de uso, constituye riesgos aceptables cuando se ponderan frente a los beneficios para el paciente. Los resultados de rendimiento de los dispositivos en cuestión son coherentes con los esperados para este tipo de dispositivo cuando se usa según lo previsto.

Los posibles efectos secundarios no deseados asociados con el uso del FemoSeal™ VCS incluyen los acontecimientos adversos comúnmente notificados con medios alternativos de cierre de la arteriotomía, por ejemplo, hemorragia y hematoma. En general, las tasas de incidencia de los acontecimientos adversos notificados con el uso del FemoSeal™ VCS son similares a las tasas registradas con la compresión manual y dispositivos de cierre vascular similares.

Específicamente, en el caso de hemorragias y hematomas, las tasas registradas para FemoSeal™ VCS son inferiores a las tasas registradas para dispositivos de cierre vascular similares. Cada uno

de los eventos adversos notificados, tanto de la bibliografía publicada como de la vigilancia posterior a la comercialización, se habían identificado previamente (consulte la **sección 1.3**).

Los datos existentes sobre la seguridad clínica y el rendimiento de FemoSeal™ VCS sugieren que los beneficios para el paciente del uso de este dispositivo de cierre vascular superan los posibles riesgos cuando se utiliza de acuerdo con las instrucciones de uso.

Como se ha indicado en las secciones anteriores, los datos proporcionados para FemoSeal™ VCS demuestran la coincidencia entre los datos relacionados con el dispositivo en evaluación (p. ej., uso del dispositivo, resultados de seguridad, rendimiento clínico y beneficios clínicos), los dispositivos equivalentes identificados y los datos relacionados con dispositivos similares enumerados en la tecnología de vanguardia.

El análisis cruzado de los datos de seguridad no identificó ninguna laguna entre lo siguiente:

- Datos mencionados en la tecnología de vanguardia
- Datos específicos del dispositivo en evaluación
- Datos mencionados en los archivos de gestión de riesgos
- Los datos mencionados en el etiquetado y/o las instrucciones de uso (es decir, los riesgos residuales que se deben transmitir al usuario están abordados).

La seguridad clínica se ha demostrado por las bajas tasas de complicaciones identificadas en la bibliografía clínica revisada por pares publicada, los estudios clínicos promocionados por la empresa, la revisión de los datos posteriores a la comercialización y la ausencia de retiradas del mercado. No se han identificado problemas con el rendimiento, la bibliografía revisada contenía el uso de FemoSeal™ VCS que coincidía con el uso previsto del fabricante.

### **1.5 Posibles alternativas de diagnóstico o tratamiento**

La compresión manual se utiliza tradicionalmente para lograr la hemostasia en el lugar de la arteriotomía después de cateterismos vasculares. La compresión manual se ha asociado con la inmovilización del paciente durante largos periodos de tiempo (hasta 8 horas después de un procedimiento) y con molestias sustanciales y estancias hospitalarias prolongadas. Una revisión sistemática reciente reveló que la media de tiempo necesario para lograr la hemostasia con compresión manual era de 20,8 minutos.<sup>1</sup>

Las alternativas a la compresión manual incluyen dispositivos hemostáticos externos que aplican compresión mecánica al sitio de la arteriotomía. Estos dispositivos no acortan el tiempo de hemostasia o de deambulación, sino que reducen los requisitos del personal al sustituir la compresión manual por compresión mecánica. Los índices de acontecimientos adversos asociados al uso de la compresión mecánica son similares a los de la compresión manual.

Los dispositivos de cierre vascular, como FemoSeal™ VCS, están diseñados para cerrar la arteriotomía. Su objetivo es reducir el tiempo de hemostasia y permitir una deambulación más temprana. Una revisión sistemática reciente, que incluye 13 dispositivos disponibles comercialmente, halló que el tiempo medio para lograr la hemostasia con un dispositivo de cierre vascular era de 5,4 minutos. El tiempo medio de hemostasia para los dispositivos de cierre vascular individuales osciló entre 1 (FemoSeal™ VCS) y 14 minutos; la mayoría de los dispositivos es de entre 4 y 10 minutos.<sup>1</sup>

Entre los acontecimientos adversos notificados habitualmente asociados al cierre del lugar de la arteriotomía, con compresiones manuales, dispositivos hemostáticos externos o dispositivos de cierre vascular, se incluyen hematoma, sangrado en el lugar de acceso, pseudoaneurisma, fístula arteriovenosa e infección. La misma revisión sistemática (34 ensayos controlados aleatorizados, 14 401 pacientes) halló que las tasas de acontecimientos adversos eran similares entre la compresión manual y el uso de dispositivos de cierre vascular, con la excepción de que el sangrado tendía a ser un poco más alto con los dispositivos de cierre vascular.<sup>1</sup>

## 1.6 Perfil y formación sugeridos para los usuarios

Los usuarios previstos del FemoSeal™ Vascular Closure System son médicos con formación que les permite realizar el acceso arterial y el cierre para procedimientos endovasculares a través de la arteria femoral común y han participado en un programa de formación médica FemoSeal™ de Terumo Medical Corporation.

## 1.7 Normas armonizadas y comunes relevantes

Ohutuse ja kliinilise toimivuse kokkuvõtte (SSCP) eesmärk on anda avalikkusele ligipääs FemoSeal™ Vascular Closure Systemi (VSC) ohutuse ja kliinilise toimivuse peamiste aspektide uuendatud kokkuvõttele.

Kokkuvõtte seadme ohutusest ja kliinilisest toimivusest kasutajatele/tervishoiutöötajatele on esitatud **lõigus 1.0**.

## **1.0 KOKKUVÕTE KASUTAJATELE/TERVISHOIUTÖÖTAJATELE**

SSCP ei asenda kasutusjuhendit, mis on seadme ohutu kasutamise tagamise põhidokument, ega anna ettenähtud kasutajatele või patsientidele diagnoosimise või ravi soovitusi. SSCP ei asenda kohustuslikku teavet implantaadikaartidel ega muudes kohustuslikes dokumentides.

### **1.1 Seadme kavandatud sihtotstarve**

#### **1.1.1 Ettenähtud kasutus**

FemoSeal™ Vascular Closure System on meditsiiniseade, mis on ette nähtud arteri punktsioonikoha sulgemiseks pärast perkutaanset kateteriseerimist läbi ühisreiarteri.

#### **1.1.2 Kasutusnäidustused**

FemoSeal™ Vascular Closure System on ette nähtud kasutamiseks ühisreiarteri punktsioonikoha (arteriotoomia) sulgemiseks patsientidel, kellele on tehtud perkutaanne kateteriseerimine 7 Fr (2,33 mm) või väiksema protseduurikanüüliga.

#### **1.1.3 Vastunäidustused ja/või piirangud**

FemoSeal™ Vascular Closure Systemi kasutamine on vastunäidustatud patsientidel, kelle arteriotoomias kasutati kanüüle ja seadmeid, mis olid suuremaid kui 7 Fr (2,33 mm).

#### **1.1.4 Patsientide sihtrühmad**

FemoSeal™ Vascular Closure Systemi ohutus ja efektiivsus on tõestatud 18-aastastel ja vanematel patsientidel, kes on läbinud perkutaanse kateteriseerimise, kus kasutati 7 Fr (2,33 mm) või väiksemat protseduurikanüüli.

#### **1.1.5 Patsientide erirühmad**

FemoSeal™ Vascular Closure Systemi ohutus ja efektiivsus ei ole tõestatud järgmistel patsiendirühmadel.

- Olemasoleva autoimmuunhaigusega patsiendid.
- Terapeutilist trombolüüsi saavad patsiendid.
- Kliiniliselt olulise perifeersete veresoonte haigusega patsiendid.
- Ravimata hüpertensiooniga patsiendid ( $> 220$  mmHg süstoolne või  $> 110$  mmHg diastoolne).
- Veritsushäiretega patsiendid, sh trombotsütoopenia (trombotsüütide arv  $< 100\,000$ ) või aneemia (Hgb  $< 10$  mg/dl).
- Patsiendid, kelle ühisreiarteri valendik on väiksem kui 5 mm.

- Neeru- ja/või maksakahjustusega patsiendid.
- Muu asjakohase kaasuva haigusega patsiendid.
- Spetsiifilise rassilise ja/või etnilise päritoluga patsiendid.
- Patsiendid, kellel oli 72 tunni jooksul müokardiinfarkt.
- Patsiendid, kellel on punktsioonikohas veresoonesiirik või stent.
- Rasedad või imetavad patsiendid.
- Alla 18-aastased patsiendid.

### 1.1.6 Ettenähtud kasutajad

FemoSeal™ Vascular Closure Systemi ettenähtud kasutajad on arstid, kes on saanud väljaõppe arteriaalse ligipääsu ja sulgemisega endovaskulaarseteks protseduurideks ühisreiarteri kaudu ning kes on osalenud Terumo Medical Corporationi FemoSeal™-i arstide väljaõppeprogrammis.

## 1.2 Seadme kirjeldus

### 1.2.1 Seadme kirjeldus

FemoSeal™ Vascular Closure System, mida toodab Terumo Medical Corporation (TMC), on resorbeeruv vaskulaarne sulgemisseade, mis on kavandatud reiarteri hemostaasi saavutamiseks pärast perkutaanset kateteriseerimist ühisreiarteri kaudu.

FemoSeal™-i sulgemiselemendid koosnevad kahest resorbeeruvast polümeerkettast, sisemisest sulgurist ja välimisest lukustusplaadist, mida hoiab koos resorbeeruv multifilament, mis koos sulgevad arteriotoomia mehhaaniliselt (vt **joonis 1.1** ja **joonis 1.2**). Pärast korpuse koonilisest kanüülist väljutamist pressitakse välimine lukustusplaat mööda multifilamendist telge alla, tekitades sisemise sulguri ja välimise lukustusplaadi vahel punktsioonikoha mehaanilise sulguse. Sisemist sulgurit ja välimist lukustusplaati hoiab multifilamendist teljel paigal hõordejõud. Hemostaas saavutatakse mehaaniliste vahenditega. Sulgemiselemendid lagunevad hüdroolüüsi teel.

Implanteeritavad sulgemiskomponendid, sisemine sulgur ja välimine lukustusplaat lagunevad kaheksateistkümne (18) kuuga, multifilament laguneb ja resorbeerub hüdroolüüsi teel ümbritsevasse kudedesse hinnanguliselt kahe (2) kuni kolme (3) aastaga. Implanteeritavate sulgemiskomponentide võimet säilitada arteriotoomial kompressiooni on katsetatud kuni kaheksa (8) tunni vältel. Laguproduktid metaboliseeruvad ja erituvad uriiniga või hingatakse süsinikdioksiidi kujul välja kopsude kaudu. Loomkatsetes ei ole täheldatud akumulatsiooniefekti. FemoSeal™-i komponendid, mis puutuvad protseduuri ajal kokku eluskudede või verega, on korpuse kooniline kanüül, dilataator, tihendustoru, tõukur ja juhtetraat.

**Joonis 1.1 Sisemine sulgur ja välimine lukustusplaat**

**Joonis 1.2 Sisemine sulgur ja välimine lukustusplaat paigaldatuna**

FemoSeal™-i seade on pakendatud koos dilataatori ja 0,038-tollise (0,97 mm) läbimõõduga, 27,5-tollise (70 cm) pikkuse juhtetraadi ja J-sirgendajaga, vt **joonis 1.3** allpool. Juhtetraat asub polüetüleentorus. Kõik osad on pakitud kinnisele paberalusele. Pakend sisaldab ka patsiendi implantaadikaarti. FemoSeal™ Vascular Closure System ei vaja seadme sihtotstarbeliseks tööks lisatarvikuid ning seade on mõeldud kasutamiseks ainult koos dilataatori ja juhtetraadiga, mis on kaasas toote pakendis.

**Joonis 1.3 FemoSeal™ VCS-i seade koos juhtetraadi ja dilataatoriga**

## 1.2.2 Toormaterjalid ja komponendid

Allolevas tabelis 1.1 on loetletud FemoSeal™ VCS-i komponendid.

**Tabel 1.1 FemoSeal™ VCS-i toormaterjalid ja komponendid**

\* Seadme implanteeritav osa; implanteeritavad komponendid on MRT-ohutud

FemoSeal™ VCS on steriliseeritud etüleenoksiidiga (EO) ja see on ühekordselt kasutatav meditsiiniseade. FemoSeal™ VCS-i seade on välja töötatud selliselt, et seda ei saa korduvalt kasutada.

### **Toimimisviis**

FemoSeal™ VCS võimaldab saavutada mehaanilise hemostaasi implanteeritavate sulgemiselementide paigaldamisega ühisreiearterisse ja sellest väljapoole. Verejooksu tõkestava mehhanismi tekitavad sisemine sulgur, mis sulgeb punktsioonikoha, ja välimine lukustusplaat, mis hoiab sisemist sulgurit paigal.

### **1.2.3 Kliiniline kasu**

FemoSeal™ VCS-i kasutamine pakub pärast ühisreiearteri punktsiooni järgmisi kliinilisi eeliseid.

- Lüheneb hemostaasiks kuluv aeg<sup>1</sup>
- Lüheneb liikuma hakkamiseni kuluv aeg<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### **1.2.4 Varasemad põlvkonnad või variandid**

- FemoSeal™ VCS-i esimest versiooni (nr 11200) müüdi Euroopa turul 2005. aastal ja osaliselt ka 2006. aastal.
- Praegune FemoSeal™ VCS (nr 11202), millel on täiustatud paigaldussüsteem, on olnud turul alates 28. märtsist 2006.

### 1.2.5 Seadmega koos kasutatavad lisatarvikud

FemoSeal™-i seade on pakendatud koos dilataatori ja 0,038-tollise (0,97°mm) läbimõõduga, 27,5-tollise (70°cm) pikkusega juhtetraadi ja J-sirgendajaga. Juhtetraat on FemoSeal™-i seadme lisatarvik. J-sirgendaja on juhtetraadi osa, dilataator on FemoSeal™-i seadme osa. Juhtetraat on ainus vajaminev lisatarvik. Juhtetraat asub polüetüleentorus. Kõik osad on pakitud kinnisele paberalusele. Pakend sisaldab ka patsiendi implantaadikaarti. FemoSeal™ Vascular Closure System ei vaja seadme sihtotstarbeliseks tööks lisatarvikuid ning seade on mõeldud kasutamiseks ainult koos dilataatori ja juhtetraadiga, mis on kaasas toote pakendis.

### 1.2.6 Muude seadmega koos kasutamiseks ette nähtud seadmete ja toodete kirjeldus

FemoSeal™ VCS ei vaja ettenähtud viisil toimimiseks lisaseadmeid.

## 1.3 Riskid ja hoiatused

### 1.3.1 Jääkriskid ja soovimatud mõjud

Teadaolevad või eeldatavad kõrvalnähud, kahjustused ja tüsistused, mis on seotud jääkriskidega FemoSeal™ VCS-i kasutamise tõttu, on loetletud **tabelis 1.2**. Juhtude esinemismäär põhineb riskidokumentatsiooni analüüsil ja arvutati turustamisjärgse järelevalve andmete põhjal ajavahemikust 1. septembrist 2019 kuni 31. augustini 2024. FemoSeal™ VCS-iga ei ole teadaolevaid jääkriske ning kõiki kohaldatavaid riske on käsitletud kasutusjuhendis ja riskijuhtimisprotsessis.

**Tabel 1.2. FemoSeali kõrvalnähud/tüsistused**

| Kahju                  | Esinemissagedus (%) | Leevendavad tegurid                                                                                                                                       |
|------------------------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|

### 1.3.2 Hoiatused ja ettevaatusabinõud

#### Hoiatused

- Ärge kasutage, kui pakend on kahjustatud või kui steriilsusbarjääri on rikutud.
- Ärge kasutage pärast kõlblikkusaja lõppu, kuna biolagunevad komponendid ei pruugi piisavalt hästi toimida.
- Ärge kasutage, kui mõni ese on mingil viisil kahjustatud või defektne.
- FemoSeal™ Vascular Closure Systemi kasutamine olukorras, kus protseduurikanüül või ümbritsev kude võib olla bakteriaalselt saastunud, võib põhjustada infektsiooni.
- Kui kahtlustate tagumise arteriseina punktsiooni või mitut arteripunktsiooni, siis ärge tuginege arteriaalse hemostaasi saavutamiseks üksnes FemoSeal™ Vascular Closure Systemile. Kasutage manuaalset või mehaanilist lisakompressiooni.

6. Kui punktsioonikoht asub reiearteri bifurkatsioonil või sellest distaalsel, ei tohi FemoSeal™ Vascular Closure Systemit kasutada, sest see võib põhjustada sisemise sulguri valepaigutust. See võib põhjustada veritsustüsistusi ja/või normaalse verevoolu häireid.
7. Kui sisselõike kohas on püsiv arteriaalne verejooks, siis ärge lõigake multifilamenti enne, kui on saavutatud hemostaas. Kui hemostaasi ei saavutata, kinnitage multifilament steriilse haavaplaastriga ja avaldage kuni hemostaasi saavutamiseni lisasurvet. Püsiva arteriaalse verejooksu korral võivad tekkida tõsised veritsustüsistused, mis võivad lõppeda patsiendi tervisekahjustuse või surmaga.
8. Ärge kasutage FemoSeal™ Vascular Closure Systemit, kui punktsioonikoht on kubemesidemest proksimaalsel, sest see võib põhjustada retroperitoneaalse hematoomi.
9. Suurema verejooksuriskiga patsientidel võib tekkida suurem verekaotus, mis nõuab vereülekannet.
10. Kui sisemine ketas tuleb lahti, võib see põhjustada tromboosi ja/või embooliat.

#### **Ettevaatusabinõud**

1. FemoSeal™ Vascular Closure Systemi paigaldamise protseduuri peavad tegema arstid, kes on saanud seadme kasutamiseks piisava väljaõppe.
2. Enne FemoSeal™ Vascular Closure Systemi paigaldamist tehke piiratud reieangiogramm või ultraheliga juhitud reiepunktsioon.
3. Katkestage protseduur, kui:
  - ühisreiearteri valendiku läbimõõt on  $< 5$  mm;
  - ühisreiearteri punktsioonikoha läheduses on stenoos ja/või märkimisväärne naastulisus;
  - arteri punktsioonikoht asub reiearteri bifurkatsioonil või sellest distaalsel;
  - ühisreiearteri punktsioonikoha läheduses on anomaalsed sooneharud või sooneanomaaliad.
4. Hematoomi korral peab korpuse koonilise kanüüli arterisse sisestamisel olema eriti hoolikas.
5. Kasutage ühe seina punktsiooni tehnikat. Arteri tagaseina mitte punkteerida.
6. FemoSeal™ Vascular Closure Systemi kasutamisel tuleb alati järgida steriilset tehnikat.
7. FemoSeal™ Vascular Closure System on mõeldud ainult ühekordseks kasutamiseks ja seda ei tohi mingil viisil uuesti kasutada ega resteriliseerida. Seade FemoSeal™ on välja töötatud selliselt, et seda ei saa korduvalt kasutada.

8. Kui sisemise sulguri vabastamisel tekib ootamatu takistus, katkestage protseduur.
9. Sisemise sulguri õigeks paigaldamiseks paigutage oma põial nii, et nupp saaks vabalt tagasi hüpata.
10. Enne välimise lukustusplaadi paigaldamist veenduge, et FemoSeal™-i seadme korpuse koonilise kanüüli ots oleks nahapinna all. Kui patsendil on reiearteri ja naha vahel vähe ruumi, siis võib välimine lukustusplaat kogemata vabaneda naha peal.
11. Õigeks paigaldamiseks võib enne paigaldamist olla vajalik teha nahalõige.
12. Kui sisemine sulgur on arteri sees, kuid nuppu ei ole võimalik lõpuni alla vajutada ja välimist lukustusplaati paigaldada, võib olla vajalik operatsioon FemoSeal™-i sulgemiselementide eemaldamiseks.
13. Kui 18 kuu jooksul osutub vajalikuks sama reiearteri punktsioon, tuleb uus punktsioon teha vähemalt üks sentimeeter varasemast FemoSeal™ Vascular Closure Systemi paikmest proksimaalsele.
14. Andke patsiendile juhised, et ta järgiks sulgemiskoha ülevaatuse osas arsti suuniseid.
15. Andke patsiendile juhised, et ta kannaks patsiendikaarti järgmised 18°kuud endaga kaasas.

### **Ettevaatusabinõud väljakirjutamisel**

Enne väljakirjutamise kaalumist tuleb patsiendi seisundit hinnata järgmiste kliiniliste seisundite suhtes.

1. Veritsus ja/või hematoom sulgemiskohas.
2. Valu kõndimise ajal.
3. Infektsioonitunnused sulgemiskohas.

### **1.3.3 Valdkonna ohutuse parandusmeetmed**

Vahemikus 1. septembrist 2019 kuni 31. augustini 2024 anti teada ühest FemoSeal™ VCS-iga seotud valdkonna ohutuse parandusmeetmest.

2022. aastal kutsus Terumo vabatahtlikult tagasi FemoSeal™ VCS-i kaebuste tõttu, milles väideti, et Elktoni toodetud FemoSeali toote survejõu mõõtmise ja tagasitõmbeljõu katsetamise protsessis ja partiide vabastamisel esines tõrkeid. Lõuna-Koreast kutsuti tagasi kokku 950 seadet.

## 1.4 Kliiniline hindamine ja turustamisjärgne kliiniline järelkontroll

**Tabel 1.3** sisaldab loendit olulisematest uuringutest enne FemoSeal™ VCS-i turuletoomist ning turustamisjärgsetest uuringutest ja turustamisjärgse kliinilise järelkontrolli toimingutest. Tabelis on nimetatud ka uuringus kasutatud seadme versioon. FemoSeal™ VCS-i esimene versioon (nr 11200) oli turul kuni 2006. aastani, järgmine versioon (nr C11202) tuli turule 2006. aastal ja seda turustatakse ka praegu.

**Tabel 1.3 Olulisemate uuringute kokkuvõte**

| Turustamiseelsed funktsionaalsed loomkatsed                                                                                                                                                                                                                             | Seadme versioon            |

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Teostanud Biomatech, Prantsusmaa | Loomkatse | Uuringu eesmärk oli hinnata bioühilduvust ja biofunktsionaalsust biolagunevas implantaadis, mis on ette nähtud hemostaasi tekitamiseks veresoonekonnas. Testitud seade oli ette nähtud sisestamiseks arteriseina punktsiooniavasse ja hemostaasi tekitamiseks. Üks ketas sisenes arteri punktsiooniavasse ja teine tõmbas sisemise ketta arteri välisküljelt pingule. Mõlemad kettad sisestati sisestuskanüüli kaudu. Plaadid olid ette nähtud ära hoidma veritsust, sulandudes paranemise käigus veresoone seina, | Implanteerimisperiood/järelkontroll on kõigi loomade puhul 5 nädalat<br><br>4 lammast, 1 siga<br><br>14 sulgemiselementi<br><br>8 sulgemiselementi implanteeriti 2 lambale,<br><br>2 sulgemiselementi implanteeriti 1 seale<br><br>Kui samasse reiearterisse implanteeriti kaks | Registreeriti kõik kõrvaltoimete kriteeriumid (põletik, nekroos, verejooks või muud kahjustused) ja õhukese pseudointima kihi teke. Erilist tähelepanu pöörati seadme esmasele koeintegratsioonile, eelkõige sisemise ketta kapseldumisele.<br><br>Makroskoopiliselt ei täheldatud olulist kohalikku talumatust ega trombi teket. Pärast sulgemiselementide implanteerimist reiearteritesse ei ilmnunud makroskoopilisel vaatlusel                                                                                                                                                                                                                                                                  |

|  |  |  | ning lõpuks lagunema ja resorbeeruma. Uuringu eesmärk oli koguda ja analüüsida andmeid pärast seadme funktsionaalset implanteerimist lambale ja seale, et hinnata implantaadi võimekust säilitada füsioloogilist funktsiooni kasutamisel vereringesüsteemis, määrata peremeeslooma reaktsioon ja seadme reaktsioon (füüsiline terviklikkus, koesse kapseldumine eutaneerimis) ning hinnata implantaadi lagunemist. | sulgemiselementi, implanteeriti need > 30 mm vahega | <p>mingit erinevust lammaste ja sea vahel. Makroskoopiliselt ei täheldatud olulist kohalikku talumatust ega trombi teket. Pärast sulgemiselementide implanteerimist reicararteritesse ei ilmnunud makroskoopilisel vaatlusel mingit erinevust lammaste ja sea vahel.</p> <p>Lammaste implantatsioonikoha histopatoloogiline analüüs ei näidanud lokaalseid kõrvaltoimeid. Sise- ja välisketastel ilmnis lagunemise märke ning osal juhtudel olid need purunenud väiksemateks osadeks. Sisemised kettad olid täielikult integreerunud neointima koesse. Seal näitas histopatoloogiline analüüs sise- ja välisketaste ümbruses veidi rohkem põletikutunnuseid. Mõlemal loomal näitas multifilament veidi rohkem põletikutunnuseid kui ketta materjal, mis on põimitud õmblusmaterjali puhul suurema pindala tõttu normaalne.</p> <p>Soone avatust mõõdeti 5 nädala pärast, kasutades kolme eri meetodit: histomorfomeetriline, histomorfomeetriline koos soone läbimõõdu mõõtmisega nihiku abil ning värvidoppler-ultraheliuuringuga. Keskmise soone avatus lambal oli vahemikus 60–80%, olenevalt meetodist</p> |

|--|--|--|--|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Osana FemoSeal™ VCS-i turuletoomiseelsest arenduskavast viidi läbi 3 funktsionaalset loomkatset. 2000. aastal enne kliiniliste uuringute alustamist viidi läbi loomkatse, et hinnata FemoSeal™ VCS-i biofunktsionaalsust. Selles uuringus hinnati sulgemiselementide võimet säilitada füsioloogilist funktsiooni ja hinnati nende lagunemist. 18 kuu möödudes ei olnud sisemise ja välimise ketta materjal enam nähtav ning oli asendunud valendikusisese fibrooskoega. Kokkuvõttes sai kinnitust FemoSeal™ VCS-i sulgemiselemendi võime säilitada füsioloogilist funktsiooni kasutamisel vereringesüsteemis.

2002. aasta loomkatse eesmärk oli hinnata bioühilduvust ja biofunktsionaalsust biolagunevas implantaadis FemoSeal™ VCS, mis on ette nähtud hemostaasi saavutamiseks veresoonekonnas. Kokkuvõttes lagunes implantaat peaaegu täielikult 36 nädalaga ja ühtegi olulist ebasoodsat koereaktsiooni ei esinenud.

Teise 2002. aasta loomkatse eesmärk oli hinnata bioühilduvust ja biofunktsionaalsust biolagunevas implantaadis FemoSeal™ VCS, mis on ette nähtud hemostaasi saavutamiseks veresoonekonnas. 5 nädalaga oli ketas täielikult kapseldunud ning nii sisemise kui ka välimise ketta puhul täheldati lagunemise märke. Kokkuvõttes sai kinnitust implantaadi võime säilitada füsioloogilist funktsiooni kasutamisel vereringesüsteemis.

Osana FemoSeal™ VCS-i kliinilisest arenduskavast viis Radi Medical System AB läbi turustamiseelse kliinilise uuringu. Seda kliinilist uuringut ei ole avaldatud ja see ei ole veebis saadaval. Uuring seadme mudeliga nr 11200 viidi läbi aastatel 2002–2004 Euroopa standardi EN 540 (meditsiiniseadmete kliiniline uuring inimestel) alusel ja kooskõlas ICH kliiniliste uuringute ja heade kliiniliste tavade üldiste kaalutlustega. Uuringu üksikasjad on dokumenteeritud aruandes EU-SE-001. See kliiniline uuring dokumenteeriti Radi Medical Systems AB lõpparuandes „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures” (mitmekeskuseline kliiniline uuring reiarteri punktsiooni sulgemiseks pärast

diagnostilisi/interventsionaalseid reiearteri punktsioone FemoSeal Vascular Closure Systemiga). See kliiniline uuring viidi läbi FemoSeal™-i esimese mudeliga nr 11200 ja keskendus implanteeritavate sulgemiskomponentide ohutusele ning efektiivsusele. Ainus erinevus esimese mudeli nr 11200 ja praeguse mudeli C11202 vahel on Fr-suurus, vastavalt 6 Fr ja 7 Fr, ja täiustatud paigaldussüsteem. Kliinilised eelised, ettenähtud kasutus, tööpõhimõtted ja implanteeritavate sulgemiselementide, sisemise sulguri ja välimise lukustusplaadi toormaterjalid on samad.

Seade on ette nähtud kasutamiseks patsientidel, kellele on tehtud südame diagnostiline või interventsionaalne protseduur, kasutades ligipääsuks reiearterit. Selle uuringu eesmärk oli teha kindlaks FemoSeal™ VCS-i ohutus, toimivus ja efektiivsus. See oli prospektiivne, mitmekeskuseline, ühe rühmaga avatud uuring 30-päevase järelkontrolliga.

Esmane tulemusnäitaja oli aeg kuni hemostaasini, mis määratleti tugeva verejooksu puudumisena. Esmane ohutuse tulemusnäitaja oli raskete vaskulaarsete tüsistuste avaldumus 30 päeva jooksul. Teisesteks tulemusnäitajateks olid aeg kuni liikuma hakkamiseni, ravi ebaõnnestumiste osakaal, kõrvalnähtude avaldumus ja seadme toimivuse näitajad sisseviimise ja vabastamise ajal.

Sellesse uuringusse kaasatud patsiendid olid täiskasvanud, kes suutsid anda teadva nõusoleku ja kellel oli vähemalt üks intaktne jalgaseljaarteri pulss. Patsiendid jäeti uuringust välja, kui neil oli mõni järgmistest seisunditest.

- Anamneesis perifeerne vaskulaarne haigus
- Autoimmuunhaigus
- Teadaolev raske aneemiline veritsushäire
- INR > 1,5
- Müokardiinfarkt 72 tunni vältel
- Ravile allumatu hüpertensioon
- Rasvumus, mis välistab ligipääsu Seldingeri tehnika abil
- Veresoonesiirik või stent arteriotoomia kohas
- Varasem ipsilateraalne punktsioon 3 kuu jooksul
- Eeldatav elumus < 6 kuud

Lisaks uuriti patsiente operatsiooni ajal ja nad jäeti uuringust välja, kui täheldati mõnda järgmistest olukordadest.

- Ühisreiearteri valendiku läbimõõt < 5 mm
- Arteriharud 2 cm punktsioonikohast proksimaalsel

- Oluline stenoos kuni 3 cm kaugusel punktsioonikohast
- > 6 Fr primaarse sisestuskanüüli kasutamine
- Punktsioon reiearteri bifurkatsioonil või sellest distaalsel
- Mitu reiearteri punktsiooni
- Teadaolev või kahtlustatav reiearteri tagaseina punktsioon
- Suur hematoom (2:6 cm) protseduuri lõpetamisel
- Keeruline esmase protseduurikanüüli sisestamine, mis on tingitud väänilisest koest või veresoonest

See ühe uuringuplaaniga uuring viidi läbi kahes osas. 1. osas registreeriti 20 patsienti, seejärel tehti ohutusanalüüs ja 2. osas registreeriti veel 60 patsienti.

1. osas registreeritud patsientide keskmine vanus oli 65,9 aastat, 70,0% patsientidest olid mehed ja 95% patsientidest said samaaegselt ravimeid. 2. osas registreeritud patsientide keskmine vanus oli 63,8 aastat, 78% patsientidest olid mehed ja 100% patsientidest said samaaegselt ravimeid.

Uuringusse kaasamiseks sobisid patsiendid, kellele tehti diagnostilisi (1. ja 2. osa) või interventsionaalseid (2. osa) südame kateteriseerimisprotseduure. Protseduurid olid kooskõlas kõigi patsiente uuringusse registreerivate haiglate ravistandardiga ning seejärel kasutati FemoSeal™ VCS-i. Patsiendiandmeid koguti ravieelselt, protseduuri ajal ning 1. ja 30. päeval pärast protseduuri. Tulemused on kokku võetud **tabelis 1.5** ja näitavad, et FemoSeal™ VCS on selles patsiendirühmas kasutamiseks ohutu ja efektiivne.

**Tabel 1.5. Turustamiseelse uuringu kliinilised tulemused**

|                                                                                                                          | 1. osa       | 2. osa                    |
|--------------------------------------------------------------------------------------------------------------------------|--------------|---------------------------|
| Patsientide arv                                                                                                          | 20           | 60                        |
| Keskmine aeg hemostaasini                                                                                                | 1,2 minutit  | 1,6 minutit <sup>a</sup>  |
| Keskmine aeg kõndima hakkamiseni                                                                                         | 72,2 minutit | 87,5 minutit <sup>b</sup> |
| Suurte vaskulaarsete tüsistuste avaldumus <sup>c</sup>                                                                   | 0 (0%)       | 1 (2%)                    |
| Kõrvalnähtudega patsientide arv                                                                                          | 5 (25%)      | 19 (32%)                  |
| Ravi ebaõnnestumine (määratletud kui suured vaskulaarsed tüsistused, vajadus manuaalse kompressiooni järele või mõlemad) | 0 (0%)       | 3 (5%)                    |
| Seadme tõrge                                                                                                             | 0 (0%)       | 6 (10%)                   |

*<sup>a</sup>Lähtuvalt 58-patsiendilisest valimist, sest 2 patsienti ei saavutanud varasemate ipsilateraalsete punktsioonide tõttu protseduuri ajal hemostaasi. Nende patsientide puhul saavutati hemostaas 7 ja 37 minuti pärast.*

*<sup>b</sup>Lähtuvalt 59-patsiendilisest valimist: 1 patsienti ei võetud arvesse, sest ta pandi kopsuturse tõttu hingamisaparaadi alla ega suutnud enam kui nädala jooksul kõndima hakata.*

*<sup>c</sup>Määratletud kui vaskulaarne tüsistus, mis vajab vereülekannet või kirurgilist ravi, või lokaalne infektsioon, mis vajab antibiootikumi, haiglaravi või haiglaravi pikendamist või haava kirurgilist puhastamist.*

Uuringu 1. osas ei täheldatud suuri vaskulaarseid tüsistusi. Uuringu 2. osas teatati 1 suurest vaskulaarsest tüsistusest: pseudoaneurüsm, millest teatati 1 päeva jooksul pärast protseduuri. Vajalikuks osutus ultraheliga juhitud kompressioon ja trombiini süstimine pseudoaneurüsmi, samuti patsiendi haiglaravi pikendamine.

Viie uuringu 1. osas teatatud kõrvalnähust 1 oli potentsiaalselt seadmega seotud: mittetõsine tugeva verejooksu juhtum 1 päev pärast protseduuri. Uuringu 2. osas esinenud 19 kõrvalnähust olid 3 seadmega seotud mittetõsised hematoomid ning lisaks täheldati 6 potentsiaalselt seadmega seotud mittetõsist kõrvalnähtu, sh 3 püsivat veritsust, 2 hematoomi ja 1 säärevalu pärast kehalist aktiivsust.

2. osas peeti ravi ebaõnnestuks 3 patsiendil: 2 hemostaasi mittesaavutamise tõttu ilma kompressioonita ja 1 suure vaskulaarse tüsistuse (pseudoaneurüsmi) tõttu. Uuringu 1. osas ravi ebaõnnestumisi ei esinenud.

Uuringu 2. osas esines kuus seadme tõrget, kolm ei häirinud protseduuri, üks oli tingitud kasutaja veast, üks oli sisestuskanüüli leke ja ühe puhul murdus filamendi kinnitus. Kaks viimast probleemi kõrvaldati C11202 mudeli uuendustega.

Turuletoomiseelse kliinilise uuringu 2. osas ei teatatud patsientide ravijärgimatuse tõttu 6 kuu järelkontrolli tulemusi. Turustamiseelse kliinilise uuringu (EU-SE-001) 30 päeva tulemused, mis on kooskõlas kliinilises kirjanduses nimetatud järelkontrolli ajaga, näitavad, et FemoSeal™ VCS on ohutu ja efektiivne.

#### **1.4.2 Turustamisjärgsete kliiniliste uuringute andmete kokkuvõte**

Allolevas **tabelis 1.6** on kirjeldatud 4 lõpetatud turustamisjärgset kliinilist uuringut. Neid kliinilisi uuringuid ei ole avaldatud ja need ei ole saadaval internetis.

Tabel 1.6 Lõpetatud turustamisjärgsed kliinilised uuringud

| Lõpetatud turustamisjärgsed kliinilised uuringud                                            |                                                        |                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                 |    |     |          |       |          |           |    |          |           |                         |          |                    |            |                     |           |                   |         |                       |          |                                |          |                      |           |                          |           |                                   |          |                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|--|--|--|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

2006. aasta uuring viidi läbi selleks, et kinnitada praeguse täiustatud paigaldussüsteemiga seadme ohutust ja efektiivsust ning saada tagasisidet FemoSeal™ VCS-i kasutusjuhendi ja koolitusprogrammi kohta. Uuring hõlmas 100 patsienti ja esmaseks tulemusnäitajaks oli see, kas hemostaas saavutati või läks vaja manuaalset või mehaanilist lisakompressiooni. Selles uuringus leiti, et FemoSeal™ VCS-i paigaldamine oli enamikel juhtudel edukas (91% saavutati kohene hemostaas).

2008. aasta uuringusse kaasati 50 patsienti, et hinnata FemoSeal™ VCS-i ohutust ja efektiivsust kasutamisel tavapärase kliinilise praktika käigus patsientidel, kellele tehti südame kateteriseerimine 7 Fr kanüüliga. Uuringu esmane tulemusnäitaja oli hemostaasiaeg ja liikumahakkamiseni kulunud aeg ilma manuaalse või mehaanilise lisakompressioonita. Uuringutulemused näitasid, et keskmine aeg hemostaasini oli 57,8 sekundit ning kõik patsiendid hakkasid liikuma pärast 4-tunnist voodipuhkust.

2009. aasta uuringu eesmärk oli hinnata uut FemoSeal™ VCS-i pakendit. Uuringusse kaasati 25 patsienti. Esmane tulemusnäitaja oli see, kas kasutajal tekkis pakendiga probleeme. Kasutajatel ei tekkinud uue FemoSeal™ VCS-i pakendiga probleeme. Selles uuringus koguti ka hemostaasini kuluva aja andmeid.

2022. aasta uuringu eesmärk oli koguda proaktiivselt ohutuse ja efektiivsuse andmeid FemoSeal VCS-i kohta ühisreiarteri ligipääsukoha hemostaasi saavutamisel kliinilistes tavatingimustes patsientidel, kellele tehakse perkutaanseid endovaskulaarseid protseduure. Uuringusse kaasati 230 patsienti. Registriuuringu esmased tulemusnäitajad on protseduuri edukus (st edukas hemostaas punktsioonikohas) ja suuremate tüsistuste (nt veresoonevigastus, ligipääsukohaga seotud verejooks, ligipääsukoha infektsioon, korduv manuaalne kompressioon ja uue ligipääsukohaga seotud ipsilateraalne alajäseme äge isheemia) arvu vähenemine. Uuringus jõuti järeldusele, et FemoSeal™ VCS toimib hästi reaalsetes tingimustes ning tagab efektiivse hemostaasi ja juurdepääsukoha tüsistuste madala määra perifeerseid endovaskulaarseid sekkumisi läbivatel patsientidel. Sellel on hea toimivus koos lühikese hemostaasini kuluva ajaga ja hea kasutajasõbralikkuse tagasisidega, mis muudab FemoSeal™ VCS-i väärtuslikuks seadmeks femoraalse juurdepääsu sulgemisel.

### **1.4.3 Turustamisjärgsete kliiniliste jätku-uuringute andmete kokkuvõte**

#### **1.4.3.1 Lõpetatud turustamisjärgne kliiniline järelkontroll**

Kokkuvõte lõpetatud turustamisjärgse kliinilise järelkontrolli toimingutest on esitatud allolevas tabelis 1.7.

**Tabel 1.7. Turustamisjärgse kliinilise järelkontrolli toimingud**

Terumo Medical Corporation on praeguse aruandlusperioodi jooksul (01. septembrist 2019 kuni 31. augustini 2024) läbi viinud kolm kvaliteetset arstide kasutajaküsitlust.

FemoSeal™-i kliiniliste küsimustikega koguti kliinilise kasutamise ajal proaktiivseid kliinilisi andmeid FemoSeal™ VCS-i ohutuse ja toimivuse kohta. Küsimustik sisaldas küsimusi, mis keskendusid seadmele üldiselt ja sellega seotud tarvikutele, sh 0,038-tolline juhtetraat, ja nende vahetule koostoimele. Juhtetraadi kliiniliste küsimustikega koguti proaktiivseid kliinilisi andmeid seoses FemoSeal™ VCS-iga koos tarnitava 0,038-tollise juhtetraadi kliinilise kasutamise ohutuse ja toimivusega. Uuringu küsimused keskendusid eeskätt juhtetraadi üldisele kasutamisele alates vaskulatuuri sisestamisest läbi protseduurikanüüli kuni traadi eemaldamiseni.

FemoSeal™ VCS ja seadmega kaasas olev 0,038-tolline juhtetraat said vastuvõetavad hinnangud, seadme kohta esitati kuus (6) kaebust ja juhtetraadi kohta üheksa (9) muud teadet, lähtuvalt kõrge kvaliteediga kliinilistest uuringutest saadud arvamuste hindamisest. Kaebusi FemoSeali kui ka juhtetraadi suhtes on hinnatud ning neid hinnati Terumo turustamisjärgse järelevalve toimingute raames. Tuvastatud ei ole uusi riske ega riskitasemeid.

2024. aastal viidi PMCF-tegevuste raames läbi arstide kasutajaküsitlus. Uuringu tulemused näitasid, et FemoSeal™ VCS-i toimivuse ja ohutuse hinnang oli üldiselt väga soodne. Näidati ka teiste juhtetraatide ühilduvust peale FemoSeal™ VCS-iga kaasasoleva standardi.

#### **1.4.3.2 Käimasolev/kavandatav turustamisjärgne kliiniline järelkontroll**

TMC-l on käimas/kavas kaks turustamisjärgset järelkontrolli toimingut. Läbi viiakse kliiniline küsitlus, et koguda prospektiivselt tagasisidet seoses juhtetraadi kasutamisega, mida müüakse koos EL-i turul oleva FemoSeal VCS-iga. Küsimustiku täidavad arstid, et oleks võimalik uurida, milliseid juhtetraate nad protseduuri käigus kasutasid. Selle uuringu eesmärk on kõrvaldada lünk, mis on tuvastatud kirjanduse ja kommentaaride puudumise tõttu FemoSeal™ VCS-i ühilduvuse kohta teiste mitte-Terumo kaubamärkide juhtetraatidega. Tagasiside sisaldab tehnilisi tulemusi, kliinilist toimivust ja ohutust seoses seadme toimimisega koos erinevate juhtetraatidega.

#### **1.4.4 Süstemaatilise kirjanduse ülevaate andmete kokkuvõte**

Terumo Medical Corporation viib läbi süstemaatilisi kirjanduse ülevaateid, et koguda ja hinnata kliinilisi ohutus- ja toimivusandmeid vaskulaarse sulgemisseadme FemoSeal™ VCS ja/või sarnaste seadmete kohta avaldatud uuringutest. Avaldatud kirjanduse iga-aastase läbivaatuse eesmärk on tuvastada varem teadmata kõrvaltoimed, jälgida teadaolevaid kõrvaltoimeid, tuvastada tekkivad riskid ja teha kindlaks FemoSeal™ VCS-i võimalik süstemaatiline väärkasutus või näidustuseväline kasutamine.

Viimases süstemaatilises kirjanduse ülevaates, mis hõlmas ajavahemikku 1. septembrist 2019 kuni 31. augustini 2024, tuvastati 29 avaldatud uuringut, mis andsid kliinilisi ohutus- ja toimivusandmeid FemoSeal™ VCS-i kohta. Üheksas uuringus teatati 23 viitest FemoSeal™

VCS-i ettenähtud ja ka mitteettenähtud kasutamisele. FemoSeal™ VCS-i kasutamist vaatlevate uuringute kirjanduse ülevaade kirjeldas uuritavat populatsiooni, mis vastas EL-is perkutaanseid vaskulaarseid kateteriseerimisprotseduure läbivatele patsientidele. Nende 23 eelretsenseeritud publikatsiooni nimekirja vt **jaotisest 3**.

Kliinilist toimivust hinnati järgmiste meetoditega.

- Hemostaasi aeg on parem kui reiearteri perkutaanse sulgemise tehnika nüüdistase või sellega samaväärne.
- Liikumahakkamisele kuluv aeg on parem kui reiearteri perkutaanse sulgemise tehnika nüüdistaseme korral või sellega samaväärne.
- Operatsioonijärgsete tüsistuste määr on võrreldav või väiksem kui praegustes ravistandardites.

Nende kliiniliste jõudlusandmete põhjal näitasid selles kirjanduse ülevaates esitatud andmed, et FemoSeal™ VCS-i võib edukalt kasutada reiearteri punktsiooni (arteriotoomia) sulgemiseks patsientidel, kes on läbinud 7 Fr või väiksema protseduurikanüüliga perkutaanse kateteriseerimise protseduuri. Täielik hemostaas saavutati enamikul patsientidest (79,65-100% juhtudest) ja see oli seotud hemostaasi saavutamise aja mediaaniga 0,5 min, keskmine aeg väljakirjutamiseni 3 päeva. 69,2-86,7% patsientidest suutis 5 tundi pärast sooneava sulgemist kõndida, keskmine operatsioonijärgne voodiaeg oli 349 min. FemoSeal™ VCS-i rike esines 3,68-4% juhtudest ja 0,9-4,4% protseduuride puhul oli vaja täiendavat manuaalset kompressiooni.

Kliinilist ohutust hinnati kõrvalnähtude alusel, mille hulka kuulusid mh, aga mitte üksnes järgmised kõrvalnähud.

- Veritsus
- Hematoom
- Pseudoaneurüsm
- Verevalum
- Arteriovenoosne fistul
- Infektsioon
- Surm

Hõlmatud uuringutes oli kõigi FemoSeal™ VCS-iga seoses teatatud kõrvalnähtude esinemissagedus madalam kui varem manuaalse kompressiooni ja muude vaskulaarsete sulgemisseadmetega seoses teatatud määrad või nendega võrreldav.

10 juhtumiuuringu läbivaatamisel ei tuvastatud ühtegi kõrvalnähtu, kuna uusi, ootamatuid, esilekerkivaid ega vastuvõetamatuid riske ei tuvastatud.

FemoSeal™ VCS-i kasutamise üldine tõhusus diagnostilise angiograafia või interventsionaalsete operatsioonide ajal sõltub mitmetest teguritest, nagu sugu, vanus, patsiendi anatoomia, kaasuvad haigused, punktsioonikoha anatoomiline asukoht, kirurgi kogemus, VCD paigaldusmeetod, operatsioonijärgne hooldus jne. Lisaks tehnilisele edule, sh hemostaasi saavutamisele, pakkus FemoSeal™ VCS kliinilist kasu vaskulaarse sulgemise korral pärast reiearteri punktsiooni, näiteks hemostaasini kuluva aja ja liikumahakkamiseni kuluva aja lühendamist. FemoSeal™ VCS-i toimivusnäitajad on kooskõlas selle seadmetüübi eeldatavate tulemustega, kui seda kasutatakse ettenähtud viisil. Mõned praeguse otsinguperioodi jooksul leitud viited näitasid, et uuritavat seadet kasutati muus anatoomilises asukohas kui ühisreiearteris ja > 7 Fr arteriotoomiate sulgemiseks, mida loetakse mitteettenähtud kasutuseks.

Ülevaatus käigus ei tuvastatud teadmata kõrvaltoimeid, uusi riske ega seadme võimalikku süstemaatilist väärkasutust. Kui FemoSeal™ VCS-i kasutavad väljaõppinud arstid ettevaatlikult, toimib meditsiiniseade siiski kasuliku ja vajaliku kliinilise seadmena. Üldiselt rahuldab sihtravi ja seega FemoSeal™ VCS praegust kliinilist vajadust vaskulaarse juurdepääsuga seotud tüsistuste ravis.

Selles kirjanduse ülevaates esitatud andmete põhjal ei tuvastatud kliinilistes tingimustes ühtki toimivus- ega ohutusprobleemi, mis oleks olnud varem teadmata, ega kõrvaltoimeid, mis oleks ilmnenud oodatust/vastuvõetavast suuremal määral. Seetõttu võib kirjanduse ülevaatest järeldada, et FemoSeal™ VCS, mida kasutatakse hemostaasi saavutamiseks arteriotoomia paikmes pärast perkutaanset kateteriseerimist, töötab eeldatud viisil ega seostu tõsiste kõrvaltoimetega.

#### 1.4.5 Turustamisjärgsete uuringute andmete kokkuvõte

Kehtestatud on ennetav PMS-süsteem ning kõikide kaebuste läbivaatamine toimub iga kuu ja kooskõlas ettevõttesiseste tootmisprotseduuridega. Kaebuste andmeid analüüsiti ajavahemikus 1. septembrist 2019 kuni 31. augustini 2024. Kokku esitati tootjale 28 meditsiiniseadme järelevalveteatist (MDV) ja 476 kliendikaebuste teatist. 28-st MDV teatest 27 olid seotud kõrvaltoimetega ja üks seadme talitlushäirega. Aruandeperioodil esines kaks surmajuhtumit, kuid ükski teatatud surmajuhtum ei olnud seotud uuritava seadmega. Tootjale esitatud 476 kaebuse seas olid kõige sagedasemad kaebuste põhjused paigaldusraskused (146 juhtu, 0,0142% esinemissagedus). Väljatõmbetõrked olid sageduselt teine, esinemissagedus 0,0126% (130 juhtu).

FemoSeal™-i vaskulaarse sulgemise süsteemion üle kogu maailma müüdud üle 1 033 136 ja Euroopa Majanduspiirkonnas 827 843. Ülemaailmse müügi alusel on kaebuste arvutuslik sagedus 0,046%. Kliendikaebuste üldine määr on väga madal. Ei tuvastatud uusi riske, mida ei oleks käsitletud kasutusjuhendis ja riskidokumentatsioonis.

Kõrvaltoimete esinemissagedused on esitatud **tabelis 1.2**. Ühtegi uut ettenägematut, esilekerkivat ega vastuvõetamatut riski ei tuvastatud. Teadaolevate kõrvaltoimete esinemissagedus või raskusaste ei suurenenud oluliselt.

#### 1.4.6 Kliinilise toimivuse ja ohutuse üldkokkuvõte

FemoSeal™ VCS on ette nähtud kasutamiseks ühisreiearteri punktsioonikoha (arteriotoomia) sulgemiseks patsientidel, kellele on tehtud perkutaanne kateteriseerimine 7 Fr (2,33 mm) või väiksema protseduurikanüüliga. See kliiniline hindamine põhineb FemoSeal™ VCS-i kavandatud kasutust puudutavate kättesaadavate turustamiseelsete ja turustamisjärgsete kliiniliste andmete ning kirjanduse põhjalikul analüüsil.

Avaldatud kirjanduse põhjalik ülevaatus hõlmas ajavahemikku 1. septembrist 2019 kuni 31. augustini 2024. Tõendusmaterjali hulka kuulus 29 uuringut FemoSeal™ VCS-i kohta. Kliinilises hindamises esitatud tõendid viivad järeldusele, et näidatud viisil kasutamisel on uuritav seade ohutu ja efektiivne ning kõik riskid või soovimatud kõrvaltoimed, mis võivad seadmega tavapärastes kasutustingimustes kaasneda, on võrdluses patsiendile avalduva kasuga vastuvõetavad riskid. Katsealuste seadmete toimivusnäitajad on kooskõlas selle seadmetüübi eeldatavate tulemustega, kui seda kasutatakse ettenähtud viisil.

FemoSeal™ VCS-i kasutamisega seotud võimalikud kõrvaltoimed hõlmavad ka teiste arteriotoomia sulgemise meetoditega seoses sageli teatatud kõrvalnähtusid, näiteks veritsust ja hematoomi. Üldiselt sarnanesid FemoSeal™ VCS-i kasutamisega teatatud kõrvalnähtude esinemissagedused manuaalse kompressiooni ja sarnaste vaskulaarsete sulgemisseadmete kasutamisel teatatud sagedustega. Täpsemalt on FemoSeal™ VCS-iga seoses teatatud veritsuse ja hematoomide määrad madalamad kui sarnaste veresoone sulgemisseadmetega seoses teatatud määrad. Kõik teatatud kõrvalnähtud, nii avaldatud kirjandusest kui ka turustamisjärgsest järelevalvest pärinevad, olid eelnevalt tuvastatud (vt **lõik 1.3**).

Olemasolevad andmed FemoSeal VCS-i kliinilise ohutuse ja efektiivsuse kohta näitavad, et patsiendi saadav kasu selle vaskulaarse sulgemisseadme kasutamisel kaalub üles võimalikud riskid, kui seda kasutatakse kasutusjuhendi kohaselt.

Nagu eelmistes jaotistes märgitud, näitavad FemoSeal™ VCS-i kohta esitatud andmed vastavust hinnatava seadmega seotud andmete (nt seadme kasutamine, ohutuse tulemused, kliiniline toimivus ja kliiniline kasu), identifitseeritud samaväärsete seadmete ja sarnaste seadmetega seotud andmete vahel, mis on loetletud tehnika nüüdisaegse taseme kirjelduses.

Ohutusandmete ristanalüüsis ei tuvastatud lünki järgmiste andmete vahel:

- Tehnika nüüdistaseme kirjelduses nimetatud andmed
- Hinnatava seadme spetsiifilised andmed
- Riskijuhtimise dokumentatsioonis nimetatud andmed
- Märgistuses ja/või kasutusjuhendis nimetatud andmed (st käsitletakse kasutajale edasiantavaid jääkriske).

Kliiniline ohutus on tõendatud tüsistuste väikese esinemissagedusega, mis on tuvastatud avaldatud eelretsenseeritud kliinilises kirjanduses, ettevõtte spondeeritud kliinilistes uuringutes ja turuletoomisjärgsete andmete läbivaatamisel ning lisaks turult tagasivõtmiste puudumisega. Toimivusega seotud probleeme ei ole tuvastatud, läbivaadatud kirjandus sisaldas FemoSeal™ VCS-i kasutamist kooskõlas tootja kavandatud kasutusviisiga.

### **1.5 Võimalikud alternatiivsed diagnostika- või ravivõimalused**

Traditsiooniliselt kasutatakse pärast vaskulaarset kateteriseerimist hemostaasi saavutamiseks arteriotoomiakohal manuaalset kompressiooni. Manuaalse kompressiooni korral on patsient pikka aega immobiilne (kuni 8 tundi pärast protseduuri) ning sellega kaasneb oluline ebamugavustunne ja pikk haiglasviibimine. Hiljutises süstemaatilises ülevaates leiti, et mediaanaeg hemostaasi saavutamiseni manuaalse kompressiooni korral on 20,8 minutit.

Alternatiivid manuaalsele kompressioonile on välised hemostaatilised seadmed, mis avaldavad arteriotoomiakohale mehaanilist survet. Need seadmed ei lühenda aega hemostaasini ega liikumahakkamiseni, vaid vähendavad personalivajadust, asendades manuaalse kompressiooni mehaanilise survega. Mehaanilise kompressiooni kasutamisega seotud kõrvalnähtude määrad sarnanevad manuaalse kompressiooni kasutamisele.

Veresoonte sulgemisseadmed, nagu FemoSeal™ VCS, on ette nähtud arteriotoomia sulgemiseks. Nende eesmärk on vähendada aega hemostaasini ja teha võimalikuks varasem liikuma hakkamine. Hiljuti läbi viidud süstemaatilises ülevaates 13 kaubandusvõrgus saadaoleva seadmega leiti, et mediaanaeg hemostaasi saavutamiseni vaskulaarse sulgemisseadmega on 5,4 minutit. Kõigi vaskulaarsete sulgemisseadmete mediaanne hemostaasiaeg on vahemikus 1 minut (FemoSeal™ VCS) kuni 14 minutit; enamasti 4 kuni 10 minutit.<sup>1</sup>

Arteriotoomiakoha sulgemisega seotud sageli teatatud kõrvalnähud manuaalse kompressiooni, välise hemostaasiseadmete või vaskulaarsete sulgemisseadmete kasutamisel on muu hulgas hematoom, veritsus ligipääsukohas, pseudoaneurüsm, arteriovenoosne fistul ja infektsioon. Sama süstemaatiline ülevaade (34 randomiseeritud kontrollitud uuringut, 14 401 patsienti) leidis, et kõrvaltoimete esinemissagedus oli manuaalse kompressiooni ja vaskulaarsete sulgemisseadmete kasutamisel sarnane, välja arvatud veritsuse osas, mis kaldus vaskulaarsete sulgemisseadmete puhul olema veidi kõrgem.<sup>1</sup>

## 1.6 Soovitatav kasutajaprofiil ja väljaõpe

FemoSeal™ Vascular Closure Systemi ettenähtud kasutajad on arstid, kes on saanud väljaõppe arteriaalse ligipääsu ja sulgemisega endovaskulaarseteks protseduurideks ühisreiarteri kaudu ning kes on osalenud Terumo Medical Corporationi FemoSeal™-i arstide väljaõppeprogrammis.

## 1.7 Asjakohased ühtlustatud ja ühised standardid

Tämän turvallisuutta ja kliinistä suorituskyyä koskevan tiivistelmän (Summary of Safety and Clinical Performance, SSCP) tarkoituksena on mahdollistaa julkinen pääsy FemoSeal™ Vascular Closure Systemin (VCS) turvallisuuteen ja kliiniseen suorituskyyyn liittyvien keskeisten seikkojen päivitettyyn tiivistelmään.

Käyttäjille / terveydenhuollon ammattihenkilöille tarkoitettu tiivistelmä laitteen turvallisuudesta ja kliinisestä suorituskyyvystä on alla **kohdassa 1.0**.

## **1.0 TIIVISTELMÄ KÄYTTÄJILLE / TERVEYDENHUOLLON AMMATTIHENKILÖILLE**

SSCP:n ei ole tarkoitus korvata käyttöohjetta pääasiallisena asiakirjana laitteen turvallisen käytön varmistamiseksi, eikä sen ole tarkoitus antaa diagnostisia tai hoitoa koskevia ehdotuksia käyttötarkoituksen mukaisille käyttäjille tai potilaille. SSCP:tä ei ole tarkoitettu korvaamaan implanttikorteissa tai muissa pakollisissa asiakirjoissa olevia pakollisia tietoja.

### **1.1 Laitteen käyttötarkoitus**

#### **1.1.1 Käyttötarkoitus**

FemoSeal™ Vascular Closure System on lääkinällinen laite, joka on tarkoitettu valtimopunktion sulkemiseen yhteisen reisivaltimon kautta suoritettun perkutaanisen katetroinnin jälkeen.

#### **1.1.2 Käyttöindikaatiot**

FemoSeal™ Vascular Closure System on tarkoitettu yhteisen reisivaltimon punktion (arteriotomian) sulkemiseen potilailla, joille on suoritettu perkutaaninen katetrointi käyttämällä enintään 7F (2,33 mm) -kokoista toimenpideholkkia.

#### **1.1.3 Vasta-aiheet ja/tai rajoitukset**

FemoSeal™ Vascular Closure System on vasta-aiheinen potilailla, joiden arteriotomiassa on käytetty yli 7F:n (2.33 mm) holkkeja tai laitteita.

#### **1.1.4 Kohdepotilasryhmät**

FemoSeal™ Vascular Closure Systemin turvallisuus ja teho on varmistettu vähintään 18-vuotiailla potilailla, joille on suoritettu perkutaaninen katetrointi käyttäen enintään 7F (2,33 mm) -kokoista toimenpideholkkia.

#### **1.1.5 Erityispotilasryhmät**

FemoSeal™ Vascular Closure Systemin turvallisuutta ja tehoa ei ole varmistettu seuraavissa potilasryhmissä:

- Potilaat, joilla on autoimmuunisairaus.
- Potilaat, jotka saavat trombolyyssihoitoa.
- Potilaat, joilla on kliinisesti merkittävä ääreisverisuonisairaus.
- Potilaat, joilla on hoitamaton hypertensio (systole > 220 mmHg tai diastole > 110 mmHg).
- Potilaat, joilla on verenvuotohäiriö, mukaan lukien trombositopenia (verihiutalearvo < 100 000) tai anemia (Hgb < 10 mg/dl).
- Potilaat, joiden yhteisen reisivaltimon sisälumen on alle 5 mm.

- Potilaat, joilla on munuaisten ja/tai maksan vajaatoiminta.
- Potilaat, joilla on muita merkittäviä samanaikaisia sairauksia.
- Tiettyä rotua ja/tai etnistä alkuperää edustava populaatio.
- Potilaat, joilla on ollut sydäninfarkti 72 tunnin kuluessa.
- Potilaat, joilla on verisuonisiirre tai stentti punktiokohdassa.
- Potilaat, jotka ovat raskaana tai imettävät.
- Alle 18-vuotiaat potilaat.

### 1.1.6 Suunnitellut käyttäjät

FemoSeal™ Vascular Closure Systemin suunnitellut käyttäjät ovat lääkäreitä, joilla on koulutus valtimoyhteyden avaamiseen ja sulkemiseen endovaskulaarisissa toimenpiteissä yhteisen reisivaltimon kautta ja jotka ovat osallistuneet Terumo Medical Corporationin lääkäreille tarkoitettuun FemoSeal™-opetusohjelmaan.

## 1.2 Laitteen kuvaus

### 1.2.1 Laitteen kuvaus

Terumo Medical Corporationin (TMC) valmistama FemoSeal™ Vascular Closure System on resorboituva verisuonensulkulaite, joka on tarkoitettu reisivaltimon hemostaasin aikaansaamiseen perkutaanisen katetroinnin jälkeen yhteisen reisivaltimon kautta.

FemoSeal™-laitteen sulkuelementit koostuvat kahdesta resorboituvasta polymeerilevystä, sisätiivisteestä ja ulkoisesta lukituslevystä, jotka kiinnittyvät yhteen resorboituvalla monisäikeisellä langalla sulkien näin arteriotomian mekaanisesti (katso **kuva 1.1** ja **kuva 1.2**). Kun ulkoinen lukituslevy on viety kartioholkin läpi, se työnnetään monisäikeisen langan sisältävään akseliin, jolloin punktiokohta sulkeutuu mekaanisesti sisemmän ja ulomman lukituslevyn väliin. Sisätiiviste ja ulkoinen lukituslevy pysyvät paikallaan monisäikeisen langan sisältävän akselin kitkan avulla. Hemostaasi saavutetaan mekaanisin keinoin. Sulkuelementit hajoavat hydrolyysin kautta.

Implantoitavat sulkukomponentit, sisätiiviste ja ulkoinen lukituslevy, hajoavat kahdeksassatoista (18) kuukaudessa, kun taas monisäikeisen langan arvioidaan hajoavan ja resorboituvan ympäröivän kudoksen hydrolyysin kautta 2–3 vuoden kuluessa. Implantoitavien sulkukomponenttien on testattu säilyttävän kompression arteriotomiakohdassa enintään kahdeksan (8) tunnin ajan. Hajoamistuotteet metaboloituvat ja erittyvät virtsaan tai poistuvat hiilidioksidina keuhkojen kautta. Eläinkokeissa ei ole havaittu kertymistä. Muut FemoSeal™-laitteen osat, jotka

joutuvat kosketuksiin elävän kudoksen tai veren kanssa toimenpiteen aikana, ovat kartioholkki, laajennin, työntöputki, työnnin ja johdin.

**Kuva 1.1 Sisätiiviste ja ulkoinen lukituslevy**

**Kuva 1.2 Sisätiiviste ja ulkoinen lukituslevy aktivoituna**

FemoSeal™-yksikön pakkauksessa on lisäksi laajennin, 70 cm (27,5") pitkä johdin, jonka ulkoläpimitta on 0,038" (0,97 mm), ja J-suoristaja, katso **kuva 1.3** alla. Johdin on polyeteeniletkun sisällä. Kaikki osat on pakattu kiinteälle paperialustalle. Pakkaus sisältää myös potilaan implanttikortin. FemoSeal™ Vascular Closure System ei vaadi lisätarvikkeita, jotta laite toimisi tarkoitetulla tavalla, ja laite on tarkoitettu käytettäväksi vain tuotteen pakkauksessa olevan laajentimen ja johtimen kanssa.

**Kuva 1.3 FemoSeal™ VCS -yksikkö, johdin ja laajennin**

## 1.2.2 Raaka-aineet ja komponentit

Taulukossa 1.1 alla luetellaan FemoSeal™ VCS:n komponentit.

**Table 1.1 FemoSeal™ VCS:n raaka-aineet ja komponentit**

| Osanumero | Kuvaus                                 |                                                                 | Materiaalit                                                                                                                                                                    |

\* Laitteen implantoitava osa: implantoitavat osat ovat MRI-turvallisia

FemoSeal™ VCS on steriloitu eteenioksidilla (EO), ja se on kertakäyttöinen lääkinällinen laite. FemoSeal™ VCS -laite on suunniteltu siten, ettei sitä voi käyttää uudelleen.

### **Toimintatapa**

FemoSeal™ VCS saa aikaan hemostaasin mekaanisesti aktivoimalla implantoitavat sulkuelementit yhteisen reisivaltimon sisä- ja ulkopuolella. Verenvuodon estävä mekanismi koostuu sisätiivisteestä, joka tiivistää punktiokohdan, ja ulkoisesta lukituslevystä, joka pitää sisätiivisteen paikallaan.

### 1.2.3 Kliiniset hyödyt

FemoSeal™ VCS antaa seuraavat kliiniset hyödyt verrattuna suonon sulkemiseen yhteisen reisivaltimon punktion jälkeen:

- Nopeampi hemostaasi<sup>1</sup>
- Potilas pääsee nopeammin liikkumaan<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### 1.2.4 Aiemmat laitesukupolvet tai variantit

- FemoSeal™ VCS:n (#11200) ensimmäistä versiota myytiin Euroopan markkinoilla vuonna 2005 ja osan vuotta 2006.
- Nykyinen FemoSeal™ VCS (#11202), jonka toimitusjärjestelmää on parannettu, on ollut markkinoilla 28.3.2006 lähtien.

### 1.2.5 Laitteen kanssa käytettäväksi tarkoitetut lisävarusteet

FemoSeal™-yksikön pakkauksessa on lisäksi laajennin, 70 cm (27,5") pitkä johdin, jonka ulkoläpimitta on 0,038" (0,97 mm), ja J-suoristaja. Johdin on FemoSeal™-yksikön lisävaruste. J-suoristaja on johtimen osa, kun taas laajennin on FemoSeal™-yksikön osa. Johdin on ainoa tarvittava lisävaruste. Johdin on polyteeniletkun sisällä. Kaikki osat on pakattu kiinteälle paperialustalle. Pakkaus sisältää myös potilaan implanttikortin. FemoSeal™ Vascular Closure System ei vaadi lisätarvikkeita, jotta laite toimisi tarkoitetulla tavalla, ja laite on tarkoitettu käytettäväksi vain tuotteen pakkauksessa olevan laajentimen ja johtimen kanssa.

### 1.2.6 Muut laitteen kanssa käytettäväksi tarkoitetut laitteet ja tuotteet

FemoSeal™ VCS ei vaadi lisälaitteita toimiakseen tarkoitetulla tavalla.

## 1.3 Riskit ja varoitukset

### 1.3.1 Jäännösriskit ja haittavaikutukset

FemoSeal™ VCS:n käyttöön liittyvistä jäännösriskeistä johtuvat tunnetut tai ennakoitavissa olevat haittavaikutukset, haitat ja komplikaatiot on lueteltu **taulukossa 1.2**. Esiintymistiheys perustuu riskidokumentaation analyysiin ja on laskettu markkinoille saattamisen jälkeisen seurannan tietojen perusteella 1.9.2019–31.8.2024. FemoSeal™ VCS -laitteella ei ole tuntemattomia jäännösriskejä, ja kaikki soveltuvat riskit on käsitelty käyttöohjeissa ja riskienhallintaprosessissa.

**Taulukko 1.2. FemoSeal-laitteen haittatapahtumat/komplikaatiot**

| Haitta                            | Esiintymistiheys (%) | Lieventävät tekijät                                                                                                                                                |
|-----------------------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Allerginen reaktio                | 0,0000               | Riskiä mahdollisimman paljon lieventäviä toimenpiteitä ja suunnitelmia ovat tuotesuunnitteluominaisuudet, valmistusohjeet, tuotemerkinnät ja lääkäreiden koulutus. |
| Aneurysma                         | 0,0000               |                                                                                                                                                                    |

### 1.3.2 Varoitukset ja varotoimet

#### Varoitukset

1. Ei saa käyttää, jos pakkaus on vaurioitunut tai jos steriili pakkaus ei ole ehjä.
2. Ei saa käyttää viimeisen käyttöpäivämäärän jälkeen – biohajoavat osat eivät välttämättä toimi kunnolla.
3. Ei saa käyttää, jos pakkauksessa olevat osat näyttävät vaurioituneilta tai viallisilta.
4. FemoSeal™ Vascular Closure Systemin käyttö siinä tapauksessa, jos toimenpideholkissa tai ympäröivässä kudoksessa esiintyy bakteerikontaminaatiota, voi aiheuttaa infektion.
5. Jos on syytä epäillä, että valtimon takaseinä on puhjennut tai valtimopunktioita on tehty enemmän kuin yksi, valtimon hemostaasin aikaan saamisessa ei saa luottaa pelkästään FemoSeal™ Vascular Closure Systemiin. Käytä lisäksi manuaalista tai mekaanista painamista.
6. Jos punktiokohta on reisivaltimon haarautumiskohdassa tai distaalisesti siihen nähden, FemoSeal™ Vascular Closure Systemiä ei saa käyttää, koska sisätiiviste voi sijaita väärässä kohdassa. Tämä voi johtaa verenvuotokomplikaatioihin ja/tai veren normaalin virtauksen häiriintymiseen.
7. Jos haava-alueella esiintyy jatkuvaa valtimoverenvuotoa, älä leikkaa monisäikeistä lankaa ennen kuin hemostaasi on saavutettu. Jos hemostaasia ei saada aikaan, kiinnitä monisäikeinen lanka steriilillä haavasidoksella ja paina lisäksi, kunnes hemostaasi saavutetaan. Jatkuvan valtimoverenvuodon yhteydessä voi ilmetä huomattavia verenvuotokomplikaatioita, jotka voivat johtaa potilaan vammautumiseen tai kuolemaan.
8. Älä käytä FemoSeal™ Vascular Closure Systemiä, jos punktiokohta sijaitsee proksimaalisesti nivussiteeseen nähden, sillä se voi aiheuttaa retroperitoneaalisen hematooman.
9. Potilaat, joilla on normaalia suurempi verenvuotoriski, voivat menettää enemmän verta ja tarvita verensiirtoa.
10. Jos sisälevy irtaantuu, se voi aiheuttaa tromboosin ja/tai embolian.

#### Varotoimet

1. FemoSeal™ Vascular Closure Systemin aktivointitoimenpiteen saa suorittaa vain lääkäri, jolla on laitteen käyttöön riittävä koulutus.
2. Suorita osittainen reiden varjoainekuvauksen tai ultraääniohjattu reisipunktio ennen FemoSeal™ Vascular Closure Systemin asettamista.
3. Lopeta toimenpide, jos:

- Yhteisen reisivaltimon luumenin läpimitta < 5 mm.
  - Yhteisen reisivaltimon punktiokohdan läheisyydessä on ahtauma ja/tai merkittävä plakki.
  - Valtimopunktio on reisivaltimon haarautumiskohdassa tai distaalisesti siihen nähden.
  - Yhteisen reisivaltimon punktiokohdan läheisyydessä on anomaalisia haaroja tai vaskulaarisia anomaliaita.
4. Jos potilaalla on hematooma, kartioholkin viemisessä oikein valtimoon on oltava erityisen huolellinen.
  5. Käytä yhden seinämän pistotekniikkaa. Älä puhkaise valtimon takaseinämiä.
  6. Noudata aina steriiliä tekniikkaa käyttäessäsi FemoSeal™ Vascular Closure Systemiä.
  7. FemoSeal™ Vascular Closure System on kertakäyttöinen, eikä sitä saa steriloida tai käyttää uudelleen millään tavalla. FemoSeal™-yksikkö on suunniteltu niin, ettei sitä voi käyttää uudelleen.
  8. Jos sisätiivistein paikalleen asettamisen aikana tuntuu odottamatonta vastusta, keskeytä toimenpide.
  9. Jotta sisätiiviste asettuisi oikein paikalleen, aseta peukalosi niin, että painike pääsee ponnahtamaan vapaasti takaisin.
  10. Varmista, että FemoSeal™-yksikön kartioholkin kärki on ihon pinnan alla ennen ulkoisen lukituslevyn asettamista. Ulkoinen lukituslevy voidaan vahingossa asettaa ihon pinnan yläpuolelle potilailla, joilla reisivaltimo ja ihon pinta ovat lähellä toisiaan.
  11. Oikeaan paikkaan asettaminen voi edellyttää viillon tekemistä ihoon ennen asettamista.
  12. Jos sisätiiviste on sisällä valtimossa, mutta painikkeen painaminen kokonaan alas ja ulkoisen lukituslevyn asettaminen ei ole mahdollista, kirurginen toimenpide voi olla tarpeen FemoSeal™-sulkuelementtien poistamiseksi.
  13. Jos samaan reisivaltimoon on tehtävä punktio uudelleen 18 kuukauden kuluessa, uusi punktio on tehtävä vähintään yhden senttimetrin päähän aiemmasta FemoSeal™ Vascular Closure System -laitteen sisäänvientikohdasta.
  14. Neuvo potilasta noudattamaan lääkärin määräyksiä sulkukohdan tarkastuksesta.
  15. Neuvo potilasta pitämään potilaskorttia mukanaan seuraavien 18 kuukauden ajan.

### **Varotoimet kotiuttamisen yhteydessä**

Ennen kuin harkitset kotiuttamista, arvioi potilas seuraavien kliinisten olosuhteiden mukaisesti:

1. Verenvuoto ja/tai hematooma sulkukohdassa.

2. Kipu kävellessä.
3. Merkkejä infektiosta sulkukohdassa.

### 1.3.3 Käyttöturvallisuutta korjaavat toimenpiteet

Yksi FemoSeal™ VCS -laitteeseen liittyvä käyttöturvallisuutta korjaava toimenpide on tehty 1.9.2019 ja 31.8.2024 välisenä aikana.

Vuonna 2022 Terumo pyysi vapaaehtoisesti palauttamaan FemoSeal™ VCS -laitteita, koska valitusten mukaan Elktonissa valmistetun FemoSeal-laitteen prosessi- ja eränhyväksymistestauksessa oli havaittu puutteita työntövoiman mittaamisessa ja takaisinvetovoimassa. Yhteensä 950 yksikköä palautettiin Etelä-Koreasta.

## 1.4 Kliininen arviointi ja markkinoilletulon jälkeinen kliininen seuranta

**Taulukko 1.3** sisältää luettelon FemoSeal™ VCS -laitteen markkinoille tuontiin liittyvistä keskeisistä tutkimuksista sekä markkinoille saattamisen jälkeisiä tutkimuksia ja markkinoille saattamisen jälkeisiä kliinisiä seurantatoimia. Tutkimuksessa käytetty laiteversio on mainittu alla olevassa taulukossa. FemoSeal™ VCS:n ensimmäinen versio (#11200) oli markkinoilla vuoteen 2006 asti, ja seuraava, tällä hetkellä markkinoilla oleva versio (#C11202), julkaistiin vuonna 2006.

**Taulukko 1.3 Tiivistelmä keskeisistä tutkimuksista**

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Suorittaja Biomatech, Ranska | Eläinkoe | Tutkimuksen tavoitteena oli arvioida biologisesti hajoavan, verisuoniston hemostaasin aikaansaamiseen tarkoitettujen implanttien biokyhteensopivuutta ja biotoiminnallisuutta. Testattu laite on tarkoitettu viettäväksi valtimon punktiokohtaan hemostaasin saavuttamiseksi. Toinen levy vietiin punktioreiästä sisään valtimoon ja toisella kiristettiin sisälle viety levy valtimon ulkopuolelta käsin. Kumpikin levy vietiin sisään sisäänviejän avulla. Levyjen on tarkoitus estää verenvuotoa, parantua suonien seinämää vasten ja lopulta hajota ja resorboitua. Tutkimus suunniteltiin keräämään ja analysoimaan tietoja lampailla ja sioille tehdyn toiminnallisen implantoinnin jälkeen, jotta voidaan arvioida implantin kapasiteettia fysiologisen toiminnan ylläpitämiseksi verenkiertojärjestelmässä, määrittää isännän ja laitteen vastetta (fyysinen keho, kudoksenselotuminen uhrauksen ajankohtana) sekä arvioida implantin hajoamista. | Implantaatiojakso / seuranta-aika on 5 viikkoa kaikille eläimille<br><br>4 lammasta, 1 sika<br><br>14 sulkuelementtiä<br><br>8 sulkuelementtiä implantoitu 2 lampaalle,<br><br>2 sulkuelementtiä implantoitu 1 sialle<br><br>Kun kaksi sulkuelementtiä implantoitiin samaan reisivaltimoon, ne implantoitiin > 30 mm:n etäisyydelle toisistaan | Kaikki haittavaikutuksista kertovat kriteerit (tulehdus, nekroosi, verenvuoto tai muu leesio) ja mahdollisen ohuen pseudointimaalikerroksen muodostuminen kirjattiin. Erityistä huomiota kiinnitettiin laitteen integroitumiseen alkuvaiheessa, jossa painotettiin erityisesti sisälevyn kapseloitumista.<br><br>Makroskooppisesti ei havaittu merkittäviä merkkejä paikallisesta sietokyvyttömyydestä tai suonensisäisen hyttymän muodostumisesta. Makroskooppisessa tarkastelussa ei havaittu eroa lampaiden ja sikojen välillä reisivaltimoiden sulkuelementtien implantoinnin jälkeen. Makroskooppisesti ei havaittu merkittäviä merkkejä paikallisesta sietokyvyttömyydestä tai suonensisäisen hyttymän muodostumisesta. Makroskooppisessa tarkastelussa ei havaittu eroa lampaiden ja sikojen välillä reisivaltimoiden sulkuelementtien implantoinnin jälkeen.<br><br>Lampaalla asetuskohtaan histopatologisessa analyysissä ei havaittu paikallisia haittavaikutuksia. Sisälevyssä ja ulkoisessa |

Sisälevyt olivat täysin integroituneet neointimaaliseen kudokseen. Sialla sisälevyn ja ulkoisen levyn ympärillä todettiin histopatologisessa analyysissä hieman enemmän merkkejä tulehduksesta. Molemmilla eläimillä monisäikeisessä langassa oli hieman enemmän merkkejä tulehduksesta kuin levymateriaalissa, mikä on normaalia punotun ommelaineen suuremman pinta-alan vuoksi.</p> <p>Suonen avoimuus mitattiin 5 viikon kuluttua kolmella eri menetelmällä, histomorfometrisesti, histomorfometrisesti yhdistettynä suonen läpimitan mittaukseen työntömitalla ja väridoppler-ultraäänitutkimuksella. Suonen keskimääräinen avoimuus lampailla oli 60–80 % menetelmästä riippuen (12 havaintoa). Sialla suonen keskimääräinen avoimuus oli 40–80 % (2 havaintoa).</p> |

Osana FemoSeal™ VCS:n markkinoille saattamista edeltävää kehityssuunnitelmaa tehtiin kolme toimintaa testaavaa eläinkoetta. Vuonna 2000, ennen kliinisten tutkimusten aloittamista tehtiin eläintutkimus, jossa arvioitiin FemoSeal™ VCS:n biotoiminnallisuutta. Tässä tutkimuksessa arvioitiin sulkuelementtien kykyä ylläpitää fysiologista toimintakykyä ja arvioida niiden hajoamista. 18 kuukauden kuluttua sisä- ja ulkolevyymateriaali eivät enää näkyneet, vaan ne olivat korvautuneet endoluminaalisella sidekudoksella. Yhteenvetona voidaan todeta, että tutkimuksessa vahvistettiin FemoSeal™ VCS -sulkuelementin kyky pitää yllä fysiologista toimintaa, kun sitä käytettiin verenkiertojärjestelmässä.

Vuonna 2002 tehtiin eläintutkimus, jossa arvioitiin biohajoavan FemoSeal™ VCS -implantin bioyhenteensopivuutta ja biotoiminnallisuutta. Implantti on suunniteltu hemostaasin aikaansaamiseen verisuonijärjestelmässä. Yhteenvetona voidaan todeta, että implantti oli hajonnut lähes kokonaan 36 viikon kuluttua, eikä merkittäviä haitallisia kudosreaktioita ollut.

Eräässä toisessa eläintutkimuksessa vuonna 2002 arvioitiin biohajoavan FemoSeal™ VCS -implantin bioyhenteensopivuutta ja biotoiminnallisuutta. Implantti on suunniteltu hemostaasin aikaansaamiseen verisuonijärjestelmässä. 5 viikon kuluttua levyn kapseloituminen oli täydellinen ja sisä- ja ulkolevyissä havaittiin hajoamisen merkkejä. Yhteenvetona voidaan todeta, että tutkimuksessa vahvistettiin implantin kyky ylläpitää fysiologista toimintakykyä verenkiertojärjestelmässä käytettäessä.

Osana FemoSeal™ VCS:n kliinistä kehityssuunnitelmaa Radi Medical System AB suoritti markkinoille saattamista edeltävän kliinisen tutkimuksen. Tätä kliinistä tutkimusta ei ole julkaistu tai saatavilla verkossa. Laitemallia #11200 koskeva tutkimus toteutettiin vuosina 2002–2004 eurooppalaisen standardin EN 540 (Ihmisille terveydenhuollon laitteilla ja tarvikkeilla suoritettavat kliiniset tutkimukset) mukaisesti ja ICH:n kliinisiä tutkimuksia koskevien yleisten näkökohtien ja hyvien kliinisten käytäntöjen ohjeiden mukaisesti. Tämän tutkimuksen tiedot on dokumentoitu raportissa EU-SE-001. Kliininen tutkimus dokumentoitiin Radi Medical Systems AB:n loppuraportissa “Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures”. Kliininen tutkimus suoritettiin FemoSeal™-laitteen ensimmäisellä mallilla #11200, ja siinä keskityttiin implantoitavien sulkukomponenttien turvallisuuteen ja tehoon. Ainoa ero ensimmäisen mallin #11200 ja nykyisen mallin C11202 välillä on F-koko, ensimmäisessä 6F ja nykyisessä 7F, sekä parannettu toimitusjärjestelmä. Implantoitavien sulkuelementtien, sisätiivisteiden ja ulkoisen lukituslevyn kliiniset hyödyt, käyttötarkoitus, käyttöperiaatteet ja raakamateriaalit pysyvät ennallaan.

Laite on tarkoitettu käytettäväksi potilailla, joille tehdään diagnostisia tai interventioon perustuvia sydäntoimenpiteitä reisivaltimon kautta. Tämän tutkimuksen tavoitteena oli määrittää FemoSeal™ VCS -laitteen turvallisuus, suorituskkyky ja teho. Kyseessä oli prospektiivinen, yhden tutkimushaaran avoin monikeskustutkimus, johon kuului 30 päivän seuranta.

Suorituskykyyn liittyvä ensisijainen päätetapahtuma oli hemostaasin aikaan saamiseen kuluva aika, jossa hemostaasi määriteltiin riskialttiin verenvuodon puuttumiseksi. Turvallisuuteen liittyvä ensisijainen päätetapahtuma oli vakavien verisuonikomplikaatioiden ilmaantuvuus 30 vuorokauden kuluessa. Toissijaisia päätetapahtumia olivat liikkeellelähtöaika, epäonnistuneiden hoitojen osuus, haittatapahtumien ilmaantuvuus ja laitteen suorituskykyominaisuudet toimituksen ja aktivoinnin aikana.

Tutkimukseen osallistuvat potilaat olivat aikuisia, jotka pystyivät antamaan tietoon perustuvan suostumuksen ja joilla oli vähintään yksi tuntuva jalan valtimon syke. Potilas suljettiin pois tutkimuksesta, jos tällä oli jokin seuraavista tiloista:

- Aiempi ääreisverisuonisairaus
- Autoimmuunisairaus
- Tunnettu verenvuotohäiriö tai vaikea-asteinen anemia
- INR >1,5
- Sydäninfarkti 72 tunnin kuluessa
- Hallitsematon hypertensio hoidosta huolimatta
- Seldinger-tekniikalla avaamisen estävä liikalihavuus
- Verisuonisiirre tai stentti arteriotomiakohdassa
- Edellinen ipsilateraalinen punktio 3 kuukauden sisällä
- Odotettavissa oleva elinaika < 6 kuukautta

Lisäksi potilaita tutkittiin toimenpiteen aikana, ja heidät suljettiin pois tutkimuksesta, jos havaittiin mitään seuraavista:

- Yhteisen reisivaltimon lumenin läpimitta <5 mm
- Valtimohaaroja enintään 2 cm:n päässä punktiokohdasta
- Merkittävä ahtauma enintään 3 cm:n päässä punktiokohdasta
- Käytössä olevan ensisijaisen sisäänviejäholkin koko > 6 F
- Punktiokohta reisivaltimon haarautumiskohdassa tai distaalisesti siihen nähden
- Useita reisivaltimon punktiokohtia
- Tiedossa oleva tai epäilty reisivaltimon takaseinän puhkeama
- Suuri hematooma (2:6 cm) toimenpiteen päätyttyä
- Ensisijaisen holkin sisäänvienti toimenpidettä varten hankalaa kiertyneen kudoksen tai suonen vuoksi

Yhteen tutkimussuunnitelmaan perustuva tutkimus toteutettiin kahdessa osassa: Osaan 1 otettiin 20 potilasta, minkä jälkeen tehtiin turvallisuusanalyysi, jonka jälkeen otettiin 60 potilasta lisää osan 2 aikana.

Osassa 1 tutkimukseen otettujen potilaiden keski-ikä oli 65,9 vuotta, 70,0 % potilaista oli miehiä ja 95 % potilaista käytti samanaikaisesti lääkkeitä. Tutkimuksen osassa 2 keski-ikä oli 63,8 vuotta, 78 % oli miehiä ja 100 % käytti samanaikaisesti lääkkeitä.

Tutkimukseen kelpuutettiin potilaita, joille tehtiin diagnostisia (osa 1 ja osa 2) tai interventioon perustuvia (osa 2) sydämen katetrointitoimenpiteitä. Toimenpiteissä noudatettiin jokaisen mukana olevan sairaalan hoitokäytäntöjä, minkä jälkeen käytettiin FemoSeal™ VCS -laitetta. Potilastietoja kerättiin tutkimuksen alussa, toimenpiteen aikana sekä yhden ja 30 päivän kuluttua toimenpiteestä. Tulokset esitetään tiivistelmänä **taulukossa 1.5**, ja ne osoittavat, että FemoSeal™ VCS -laitteen käyttö on turvallista ja tehokasta tässä potilasryhmässä.

**Taulukko 1.5 Markkinoille saattamista edeltävässä tutkimuksessa raportoidut kliiniset tulokset**

|                                                                                                                      | Osa 1          | Osa 2                       |

| Keskimääräinen liikkeellelähtöaika                                                                                   | 72,2 minuuttia | 87,5 minuuttia <sup>b</sup> |
| Merkittävien verisuonikomplikaatioiden esiintyminen <sup>c</sup>                                                     | 0 (0 %)        | 1 (2 %)                     |
| Haattatapahtumapotilaiden määrä                                                                                      | 5 (25 %)       | 19 (32 %)                   |
| Hoidon epäonnistuminen (määritelmänä merkittävät verisuonikomplikaatiot, manuaalisen kompression tarve tai molemmat) | 0 (0 %)        | 3 (5 %)                     |
| Laitteen toimintahäiriöt                                                                                             | 0 (0 %)        | 6 (10 %)                    |

<sup>a</sup> Perustuu kokonaisotokseen 58, koska 2 potilaalle ei saatu aikaan hemostaasia toimenpiteen aikana aiempien ipsilateraalisten pistosten vuoksi. Näillä potilailla hemostaasi saavutettiin 7 minuutin ja 37 minuutin kuluttua.

<sup>b</sup> Perustuu kokonaisotokseen 59: 1 potilas ei ollut mukana, koska hänet asetettiin hengityslaitteeseen keuhkoedeeman vuoksi eikä hän pystynyt liikkumaan yli viikkoon.

<sup>c</sup> Määritellään verisuonikomplikaatioksi, joka edellyttää verensiirtoa tai kirurgista korjausta, tai paikalliseksi infektioksi, joka edellyttää antibioottien antamista, sairaalahoitoa tai sairaalahoidon pidentämistä tai haavan puhdistamista.

Tutkimuksen osassa 1 ei todettu merkittäviä verisuonikomplikaatioita. Tutkimuksen osassa 2 raportoitiin yksi merkittävä verisuonikomplikaatio: pseudoaneurysma, joka raportoitiin yhden päivän kuluessa toimenpiteestä. Tapahtuma edellytti ultraääniohjattua kompressiota ja trombiinin injektointia valeaneurysmaan, ja se pidensi potilaan sairaalassaoloa.

Tutkimuksen osassa 1 ilmoitetuista viidestä haattatapahtumasta yksi oli mahdollisesti laitteeseen liittyvä haattatapahtuma: ei-vakava tapahtuma, jossa riskiverenvuoto ilmeni yhden päivän kuluttua toimenpiteestä. Tutkimuksen osassa 2 ilmoitetuista 19 haattatapahtumasta kolmessa tapahtumassa oli kyse laitteeseen liittyvästä, ei-vakavasta haattatapahtumasta eli hematoomasta, ja kuudessa tapahtumassa oli kyse laitteeseen mahdollisesti liittyvästä, ei-vakavasta tapahtumasta, joista kolme oli pitkittynyttä tihkumista, kaksi hematoomaa ja yksi jalkakipu liikunnan jälkeen.

Osassa 2 hoidon katsottiin epäonnistuneen kolmen potilaan kohdalla: kahdessa tapauksessa hemostaasia ei saatu aikaan ilman kompressiota, ja yksi johtui vakavasta verisuonikomplikaatiosta (pseudoaneurysma). Tutkimuksen osassa 1 ei esiintynyt hoidon epäonnistumista.

Kuudesta laitteen toimintahäiriöstä tutkimuksen osassa 2 kolme ei vaikuttanut toimenpiteeseen, yksi johtui käyttäjän virheestä, yksi vuotavasta sisäänviejästä ja yksi rikkoutuneesta kuituliitoksesta. Kaksi viimeistä käsiteltiin mallipäivityksillä, jotka otettiin käyttöön mallissa C11202.

Markkinoille saattamista edeltävän kliinisen tutkimuksen osa 2 ei raportoinut 6 kuukauden seurantatuloksista johtuen potilaan ohjeiden noudattamatta jättämisestä. Markkinoille saattamista edeltävän kliinisen tutkimuksen (EU-SE-001) 30 päivän tulokset osoittavat, että FemoSeal™ VCS on turvallinen ja tehokas. Seuranta-aika on kliinisen kirjallisuuden mukainen.

#### 1.4.2 Tiivistelmä markkinoille saattamisen jälkeen toteutetuista kliinisistä tutkimuksista

Alla olevassa **taulukossa 1.6** on kuvattu neljä markkinoille saattamisen jälkeen suoritettua kliinistä tutkimusta. Näitä kliinisiä tutkimuksia ei ole julkaistu tai saatavilla verkossa.

**Taulukko 1.6 Markkinoille saattamisen jälkeen suoritettut kliiniset tutkimukset**

|--|--|--|--|--|-----------------------------------------------------------------------|

Vuonna 2006 toteutetussa tutkimuksessa pyrittiin varmistamaan nykyisen laitteen turvallisuus ja tehokkuus parannetulla toimitusjärjestelmällä sekä palautteen saaminen FemoSeal™ VCS:n käyttöohjeista ja koulutusohjelmasta. Tutkimukseen osallistui 100 potilasta, ja ensisijainen päätetapahtuma oli, oliko hemostaasi saavutettu tai tarvittiinko manuaalista tai mekaanista lisäkompressiota. Tutkimuksessa todettiin, että FemoSeal™-järjestelmän käyttö onnistui useimmissa tapauksissa (91 % saavutettiin välitön hemostaasi).

Vuoden 2008 tutkimuksessa oli 50 potilasta, ja siinä arvioitiin FemoSeal™-laitteen turvallisuutta ja suorituskykyä, kun sitä käytettiin normaalin klinisen rutiinin yhteydessä potilailla, joille tehtiin katetrointi 7F-holkilla. Tutkimuksen ensisijaisena päätetapahtumana oli kerätä tietoa hemostaasiajasta ja liikkeellelähetyksestä ilman lisäkompressiota, manuaalista tai mekaanista. Tutkimustulosten mukaan keskimääräinen hemostaasiaika oli 57,8 sekuntia ja kaikki potilaat pystyivät liikkumaan 4 tunnin vuodelevon jälkeen.

Vuoden 2009 tutkimuksessa arvioitiin uutta FemoSeal™ VCS -pakkausta. Tutkimuksessa oli 25 potilasta. Ensisijainen päätetapahtuma oli se, kokiko käyttäjä pakkauksen kanssa ongelmia. Käyttäjillä ei ollut ongelmia uuden FemoSeal™ VCS -pakkauksen kanssa. Tutkimuksessa kerättiin tietoa myös hemostaasiajasta.

Vuoden 2022 tutkimuksen tarkoituksena oli ennakoivasti kerätä tietoa koskien FemoSeal VCS:n turvallisuutta ja tehoa yhteisen reisivaltimon hemostaasin aikaansaamisessa todellisissa tilanteissa henkilöillä, joille suoritetaan perkutaanisia endovaskulaarisia toimenpiteitä. Tutkimuksessa oli 230 potilasta. Seurantatutkimuksen ensisijaiset päätetapahtumat ovat toimenpiteen onnistuminen (ts. onnistunut punktiokohdan hemostaasi) ja merkittävien komplikaatioiden väheneminen (esim. vaskulaarinen vamma, sisäänvientikohdan verenvuoto, sisäänvientikohdan infektio, toistuva manuaalinen kompressio ja uusi sisäänvientikohtaan liittyvä akuutti ipsilateraalinen jalan iskemia). Tutkimuksessa todettiin, että FemoSeal™ VCS toimii hyvin todellisissa tilanteissa ja mahdollistaa tehokkaan hemostaasin ja alhaisen sisäänvientikohdan komplikaatioiden määrän potilailla, joille tehdään perifeerisiä endovaskulaarisia toimenpiteitä. Sen suorituskyky osoittautui hyväksi, ja hemostaasin saavuttamiseen tarvittava aika oli lyhyt. Lisäksi käyttäjiltä saatiin hyvää palautetta sen käytettävyydestä. Siten FemoSeal™ VCS on arvokas laite reisivaltimoyhteyden sulkemiseen.

### 1.4.3 Tiivistelmä markkinoille saattamisen jälkeen toteutetusta seurannasta

#### 1.4.3.1 Toteutuneet markkinoille saattamisen jälkeiset kliiniset seurantatutkimukset

Yhteenveto markkinoille saattamisen jälkeisestä kliinisestä seurannasta on alla olevassa taulukossa 1.7.

**Taulukko 1.7. Kliiniset seurantatoimet markkinoille saattamisen jälkeen**

| Markkinoille saattamisen jälkeen toteutetut kliiniset tutkimukset         |             |                                                                                  |                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Terumo Medical Corporation on toteuttanut kolme korkealaatuista lääkärikäyttäjille tehtyä tutkimusta kuluvalle raportointikaudella (1.9.2019–31.8.2024).

FemoSeal™-laitteen kliinisissä tutkimuksissa kerättiin proaktiivista kliinistä tietoa FemoSeal™ VCS -laitteen turvallisuudesta ja suorituskyvystä kliinisen käytön aikana. Tutkimukseen sisältyi kysymyksiä koko laitteesta ja siihen liittyvistä lisävarusteista, kuten 0,038" johtimesta, ja niiden välittömästä vuorovaikutuksesta. Johdinta koskevissa kliinisissä tutkimuksissa on kerätty ennakoivia kliinisiä tietoja FemoSeal™-laitteen mukana toimitetun 0,038" johtimen turvallisuudesta ja suorituskyvystä kliinisen käytön aikana. Kyselyssä keskityttiin erityisesti johtimen yleiseen käyttöön aina sisäänviennistä toimenpideholkin kautta verisuonistoon ja johtimen poistamiseen.

FemoSeal™ VCS -laite ja sen mukana toimitettava 0,038" johdin saivat hyväksytyt luokitukset, ja kuusi (6) reklamaatiota tehtiin laitteesta ja yhdeksän (9) ei-reklamaatiota johtimesta korkealaatuista kliinisistä tutkimuksista saatujen kommenttien arvioinnin perusteella. Reklamaatiot on arvioitu sekä FemoSeal-laitteen että johtimen osalta, ja ne arvioitiin osana Terumon markkinoille tulon jälkeistä valvontaprosessia. Uusia riskejä ja/tai riskitasoja ei tunnistettu.

Osana markkinoille saattamisen jälkeistä kliinistä tutkimusta toteutettiin vuonna 2024 lääkärikäyttäjille suunnattu tutkimus. Tutkimuksen tulokset osoittivat, että FemoSeal™ VCS:n suorituskky ja turvallisuus olivat yleisesti ottaen hyvin positiiviset. Myös muiden kuin FemoSeal™ VCS:n mukana toimitettujen ohjainlankojen yhteensopivuus osoitettiin.

#### 1.4.3.2 Jatkuva tai suunniteltu markkinoilletulon jälkeinen kliininen seuranta

TMC:llä on yksi meneillään oleva/suunniteltu markkinoille tulon jälkeinen kliininen seurantatoiminto. Kliininen kysely, jolla kerätään pitkän aikavälin palautetta johtimen käytöstä EU-markkinoilla myydyn FemoSeal VCS -laitteen kanssa, toteutetaan. Lääkärit vastaavat kyselyyn, ja vastausten pohjalta tutkitaan, mitä johtimia he käyttivät toimenpiteen aikana. Tämän kyselyn tarkoituksena on korjata puute, joka on tunnistettu kirjallisuuden ja ulkoisten arvioijien antamien kommenttien puuttumisena FemoSeal™ VCS:n yhteensopivuudesta muiden kuin Terumo-merkkisten ohjainlankojen kanssa. Palaute koskee teknisiä tuloksia, kliinistä suorituskkyä ja laitteen suorituskkyyn liittyvää turvallisuutta erilaisilla johtimilla.

#### 1.4.4 Systemaattisen kirjallisuuskatsauksen yhteenveto

Terumo Medical Corporation tekee systemaattisia kirjallisuuskatsauksia FemoSeal™ VCS -laitetta ja/tai vastaavia laitteita koskevista julkaistuista tutkimuksista kerätäkseen ja arvioidakseen laitteen kliinisiä turvallisuus- ja suorituskkytietoja. Julkaistun kirjallisuuden vuosittaisen seulonnan tavoitteena on tunnistaa aiemmin tuntemattomat haittavaikutukset, seurata tunnettuja haittavaikutuksia, tunnistaa mahdolliset vaaratilanteet ja tunnistaa mahdollinen FemoSeal™ VCS -laitteen systemaattinen väärinkäyttö tai myyntiluvasta poikkeava käyttö.

Tuoreimmassa systemaattisessa kirjallisuuskatsauksessa, joka koski ajanjaksoa 1.9.2019–31.8.2023, tunnistettiin 29 julkaistua tutkimusta, joissa oli FemoSeal™ VCS -laitteen kliinisiä turvallisuutta ja tehoa koskevia tietoja. Kaksikymmentäkolme referenssiä raportoi FemoSeal™ VCS:n myyntiluvan mukaisesta käytöstä ja yhdeksän tutkimusta raportoi myyntiluvasta poikkeavasta käytöstä. Nimenomaan FemoSeal™ VCS:n käyttöä koskevista tutkimuksista ilmenee tutkimuspopulaatio, joka on edustava EU:n alueella potilaiden osalta, joille suoritetaan perkutaanisia katetrointitoimenpiteitä. **Kohdassa 3** on luettelo näistä 23 vertaisarviodusta julkaisusta.

Kliinistä suorituskkyä arvioitiin seuraavilla mittareilla:

- Hemostaasiaika on parempi tai verrannollinen normaaliin reisivaltimon perkutaanisen sulkemistoimenpiteen uusimpaan tekniikkaan.
- Liikkeellelähtöaika on parempi tai verrattavissa normaaliin reisivaltimon perkutaanisen sulkemismenetelmän uusimpaan tekniikkaan.
- Leikkauksen jälkeisten komplikaatioiden määrä on alhaisempi tai verrannollinen nykyisiin hoitostandardeihin.

Näiden kliinisten suorituskkymittareiden perusteella kirjallisuuskatsauksen tiedot osoittivat, että FemoSeal™ VCS -laitetta voidaan käyttää onnistuneesti reisivaltimopunktion (arteriotomian) sulkemiseen potilailla, joille on suoritettu perkutaaninen katetrointi käyttämällä 7 Fr:n tai pienempää toimenpidetähtä. Täydellinen hemostaasi saavutettiin useimmilla potilailla (79,65–100 %), ja siihen liittyi 0,5 minuutin mediaani hemostaasiaika ja 3 päivän mediaaniaika

kotiutukseen. 69,2–86,7 % potilaista pystyi liikkumaan 5 tuntia valtimon sulkemisen jälkeen, ja leikkauksen jälkeinen keskimääräinen paras aika oli 349 minuuttia. FemoSeal™ VCS:n pettämistä havaittiin 3,68–4 %:ssa tapauksista, ja manuaalista lisäkompressiota tarvittiin 0,9–4,4 %:ssa toimenpiteistä.

Kliinistä turvallisuutta arvioitiin haittavaikutusten perusteella, mukaan lukien muun muassa seuraavat:

- Verenvuoto
- Hematooma
- Valeaneurysma
- Ruhje
- Valtimo-laskimofisteli
- Infektio
- Kuolema

Näiden haittatapahtumien FemoSeal™ VCS -laitteelle ilmoitettu esiintyvyys katsaukseen kuuluvissa tutkimuksissa oli pienempi tai verrattavissa aiempiin, manuaalista kompressiota ja muita verisuonensulkulaitteita koskeviin raportoituihin esiintyvyyksiin.

Haittatapahtumia ei havaittu 10 tapausraportin katsauksessa, koska uusia, odottamattomia, kehittymässä olevia tai ei-hyväksyttäviä riskejä ei havaittu.

FemoSeal™ VCS:n käytön yleinen toimintateho diagnostisen angiografian tai interventiotoinenpiteiden aikana riippuu useista tekijöistä, kuten potilaan sukupuolesta, iästä, anatomiasta, samanaikaisista sairauksista, punktiokohdan anatomisesta sijainnista, kirurgin kokemuksesta, VCD:n asennusmenetelmästä, leikkauksen jälkeisestä hoidosta jne. FemoSeal™ VCS:n teknisen menestyksen, mukaan lukien hemostaasin saavuttamisen, lisäksi se mahdollisti verisuonten sulkemiseen liittyviä kliinisiä hyötyjä reisivaltimon punktion jälkeen, kuten nopeamman hemostaasiajan ja nopeamman liikkeelleläähtöajan. FemoSeal™ VCS -laitteiden suorituskykytulokset ovat yhdenmukaisia tämän tyyppiseltä laitteelta odotettavien tulosten kanssa, kun sitä käytetään käyttötarkoituksen mukaisesti. Osa nykyisen tutkimusjakson aikana haetuista referensseistä osoitti tutkittavaa laitetta käytetyn muussa anatomisessa sijainnissa kuin yhteisessä reisivaltimossa ja > 7F:n arteriotomioiden sulkemisessa, mikä katsotaan myyntiluvasta poikkeavaksi toimenpiteeksi.

Katsauksen yhteydessä ei tunnistettu tuntemattomia haittavaikutuksia, mahdollisia vaaratilanteita tai laitteen mahdollista systemaattista väärinkäyttöä. Jos koulutetut lääkärit käyttävät FemoSeal™ VCS -laitetta huolellisesti, lääkinnällinen laite toimii hyödyllisenä ja olennaisena kliinisenä laitteena. Kaiken kaikkiaan kohdehoito ja siten FemoSeal™ VCS vastaavat nykyisiin kliinisiin tarpeisiin suoniyhdyteen liittyvien komplikaatioiden hoidossa.

Kaiken kaikkiaan kirjallisuuskatsauksessa ei havaittu kliinisissä olosuhteissa mitään suorituskykyä tai turvallisuutta koskevia ongelmia, jotka olisivat olleet aiemmin tuntemattomia, tai haittavaikutuksia, joita olisi esiintynyt odotettua suurempia/hyväksyttäviä määriä. Siksi kirjallisuuskatsauksen perusteella voidaan todeta, että kun FemoSeal™ VCS -laitetta käytetään kompressioon arteriotomiassa perkutaanisen katetroinnin jälkeen, se toimii edelleen odotetulla tavalla eikä siihen liity vakavia turvallisuustapahtumia.

#### 1.4.5 Tiivistelmä markkinoille saattamisen jälkeisestä valvonnasta

Käytössä on ennakkoiva markkinoille saattamisen jälkeisen valvonnan järjestelmä, ja kaikki reklamaatiot arvioidaan kuukausittain sisäisten valmistustoimenpiteiden mukaisesti. Reklamaatiotiedot analysoitiin ajalta 1.9.2019–31.8.2024. Valmistajalle lähetettiin kaiken kaikkiaan 28 lääkinnällisten laitteiden vaaratilanneilmoitusta (Medical Device Vigilance (MDV) Report) ja 476 asiakasreklamaatiota. 28 MDV-raportista 27 liittyi haittavaikutuksiin ja yksi laitteen toimintahäiriöön. Raportointijakson aikana tapahtui kaksi kuolemantapausta, mutta kumpikaan raportoiduista kuolemantapauksista ei liittynyt tutkimuslaitteeseen. Valmistajalle tehdyistä 476 reklamaatiosta yleisin syy reklamaatioon oli käyttöönottovaikeudet (146 esiintymää, esiintymistiheys 0,0142). Toiseksi yleisin vika on laitteen tulo ulos vedettäessä, ja sen osuus on 0,0126 % (130 tapahtumaa).

FemoSeal™ Vascular Closure Systemin myynti on maailmanlaajuisesti 1 030 136 kappaletta ja Euroopan talousalueella 827 843. Laskennallinen reklamaatiotiheys on maailmanlaajuisen myynnin perusteella 0,046 %. Asiakasreklamaatioiden osuus on hyvin pieni. Mitään sellaisia uusia riskejä ei tunnistettu, jotka eivät jo sisälly käyttöohjeisiin ja riskidokumentaatioon.

Haittavaikutusten esiintymistiheydet on esitetty **taulukossa 1.2**. Uusia odottamattomia, kehittyvässä olevia tai ei-hyväksyttäviä riskejä ei reklamaatioista havaittu. Tunnettujen haittavaikutusten esiintymistiheydessä tai vakavuudessa ei havaittu merkittävää nousua.

#### 1.4.6 Kliinistä suorituskykyä ja turvallisuutta koskeva kokonaistiivistelmä

FemoSeal™ VCS on tarkoitettu yhteisen reisivaltimon punktion (arteriotomian) sulkemiseen potilailla, joille on suoritettu perkutaaninen katetrointi käyttämällä enintään 7F (2,33 mm) - kokoista toimenpideholkkia. Tämä kliininen arviointi perustuu kattavaan analyysiin saatavilla olevista markkinoille saattamista edeltävistä ja markkinoille saattamisen jälkeisistä kliinisistä tiedoista ja kirjallisuudesta, jotka liittyvät FemoSeal™ VCS:n käyttötarkoitukseen.

Julkaistua kirjallisuutta tarkasteltiin kattavasti 1. syyskuuta 2019 ja 31. elokuuta 2024 väliseltä ajalta. Näyttöaineistoon sisältyi 29 FemoSeal™ VCS:ää koskevaa tutkimusta. Kliinisessä arvioinnissa esitetyn näytön perusteella voidaan päätellä, että käyttöaiheen mukaisesti käytettynä tutkittava laite on turvallinen ja tehokas ja että kaikki riskit tai ei-toivotut haittavaikutukset, jotka voivat liittyä laitteeseen normaaleissa käyttöolosuhteissa, ovat hyväksyttäviä riskejä, kun niitä verrataan hyötyihin potilaalle. Tutkittavien laitteiden suorituskykytulokset ovat yhdenmukaisia

tämän tyyppiseltä laitteelta odotettavien tulosten kanssa, kun sitä käytetään käyttötarkoituksen mukaisesti.

FemoSeal™ VCS -laitteen käyttöön liittyviä mahdollisia haittavaikutuksia ovat muun muassa haittavaikutukset, joita on yleisesti raportoitu vaihtoehtoisten arteriotomiasulkumenetelmien yhteydessä, esim. verenvuoto ja hematooma. Kaiken kaikkiaan FemoSeal™ VCS -laitteen käytön yhteydessä raportoitujen haittavaikutusten esiintyvyydet ovat samankaltaisia kuin manuaalisella kompressiolla ja vastaavilla verisuonisulkulaitteilla raportoidut esiintyvyydet. Verenvuodon ja hematooman ilmoitetut esiintyvyydet ovat kuitenkin FemoSeal™ VCS -laitteella pienempiä kuin ilmoitetut esiintyvyydet samankaltaisilla verisuonisulkulaitteilla. Jokainen ilmoitettu haittavaikutus, sekä julkaistussa kirjallisuudessa että markkinoille tulon jälkeisessä seurannassa, oli aiemmin tunnistettu (katso **kohta 1.3**).

Olemassa olevat tiedot FemoSeal VCS:n kliinisestä turvallisuudesta ja suorituskyvystä viittaavat siihen, että kyseisen verisuonisulkulaitteen käytöstä potilaalle koituvat hyödyt ovat mahdollisia riskejä suuremmat, kun sitä käytetään käyttöohjeiden mukaisesti.

Kuten edellisessä osassa mainittiin, FemoSeal™ VCS -laitteen tiedot osoittavat yhdenmukaisuuden arvioitavaan laitteeseen liittyvien tietojen (esim. laitteen käyttö, turvallisuutta koskevat tulokset, kliininen suorituskky ja kliiniset hyödyt) välillä, tunnistettujen vastaavien laitteiden ja vastaaviin laitteisiin liittyvien tietojen välillä, jotka mainitaan uusimman tekniikan mukaisten laitteiden luettelossa.

Turvallisuustietojen poikittaisanalyysissä ei puutteita havaittu seuraavien välillä:

- Nykytekniikan mukaiset tiedot
- Arvioitavaan laitteeseen liittyvät tiedot
- Riskienhallintatiedoissa mainitut tiedot
- Merkinnöissä ja/tai käyttöohjeissa mainitut tiedot (eli käyttäjälle siirtyvät jäljelle jääneet riskit on käsitelty).

Kliininen turvallisuus on osoitettu alhaisella määrällä komplikaatioita, jotka on havaittu julkaistussa vertaisarvioidussa kliinisessä kirjallisuudessa, yrityksen rahoittamissa kliinisissä tutkimuksissa, markkinoille saattamisen jälkeen saatujen tietojen tarkasteluissa, joissa ei ole mainintoja myyntilupien peruuttamista. Suorituskvyyssä ei ole havaittu ongelmia. Tutkitussa kirjallisuudessa FemoSeal™ VCS -laitetta oli käytetty valmistajan käyttötarkoituksen mukaisesti.

## 1.5 Mahdolliset diagnostiset tai terapeutiset vaihtoehdot

Manuaalista kompressiota käytetään perinteisesti hemostaasin aikaansaamiseen arteriotomikohdassa verisuonikatetroinnin jälkeen. Manuaaliseen kompressioon on liittynyt se, että potilas joutuu olemaan liikkumatta pitkiä aikoja (jopa 8 tuntia toimenpiteen jälkeen), potilas kokee huomattavaa epämukavuutta ja sairaalassaoloaika on pidentynyt. Äskettäisen systemaattisen kirjallisuuskatsauksen mukaan hemostaasin saavuttamiseen kuluvan ajan mediaani oli manuaalisella kompressiolla 20,8 minuuttia.<sup>1</sup>

Manuaalisen kompression sijasta voidaan käyttää ulkoisia hemostaasilaitteita, jotka kohdistavat arteriotomiakohtaan mekaanisen kompression. Nämä laitteet eivät lyhennä hemostaasiaikaa tai liikkumaan pääsyä, mutta ne vähentävät henkilökunnan tarvetta korvaamalla manuaalisen kompression mekaanisella kompressiolla. Mekaaniseen kompressioon liittyvät haittatapahtumat ovat samankaltaisia kuin manuaalisessa kompressiossa.

Verisuonensulkulaitteet, kuten FemoSeal™ VCS, on suunniteltu arteriotomian sulkemiseen. Niiden tarkoituksena on lyhentää hemostaasiin kuluvaa aikaa ja mahdollistaa aikaisempi liikkumaan pääsy. Äskettäin tehdyssä systemaattisessa kirjallisuuskatsauksessa, johon sisältyi 13 yleisesti saatavilla olevaa laitetta, havaittiin, että hemostaasin saavuttamiseen kuluvan ajan mediaani verisuonten sulkulaitteella oli 5,4 minuuttia. Yksittäisten verisuonensulkulaitteiden hemostaasiajan mediaani vaihteli 1 minuutista (FemoSeal™ VCS) 14 minuuttiin, ja valtaosalla laitteista se oli 4–10 minuuttia.<sup>1</sup>

Arteriotomikohdan sulkemiseen liittyviä yleisiä haittatapahtumia manuaalisen kompression, ulkoisen hemostaasilaitteen ja verisuonensulkulaitteen käytön yhteydessä ovat hematooma, verenvuoto sisäänvientikohdassa, pseudoaneurysma, arteriovenoosinen fisteli ja infektio. Samassa järjestelmällisessä katsauksessa (34 satunnaistettua kontrolloitua tutkimusta, 14 401 potilasta) havaittiin, että haittavaikutusten määrät olivat samankaltaisia manuaalisen kompression ja verisuontensulkulaitteiden käytön välillä, paitsi että verenvuoto oli yleensä hieman suurempi verisuontensulkulaitteiden kanssa.<sup>1</sup>

## 1.6 Ehdotettu käyttäjäprofiili ja koulutus

FemoSeal™ Vascular Closure Systemin suunnitellut käyttäjät ovat lääkäreitä, joilla on koulutus valtimoyhteyden avaamiseen ja sulkemiseen endovaskulaarisissa toimenpiteissä yhteisen reisivaltimon kautta ja jotka ovat osallistuneet Terumo Medical Corporationin lääkäreille tarkoitettuun FemoSeal™-opetusohjelmaan.

## 1.7 Asiaankuuluvat yhdenmukaistetut ja yleiset standardit

| Standardiviite | Nykyinen vaatimustenmukaisuusvuosi/versio | Kuvaus                                                                                                                                   |
|----------------|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|

Ce résumé des performances cliniques et de sécurité (SSCP) est destiné à donner accès au public à un résumé actualisé des principaux aspects des performances cliniques et de sécurité du FemoSeal™ Vascular Closure System (VCS).

Vous trouverez un résumé des performances cliniques et de sécurité du dispositif, destiné aux utilisateurs/professionnels de la santé, à la **Section 1.0**.

## **1.0 RESUME POUR LES UTILISATEURS/PROFESSIONNELS DE LA SANTE**

Ce SSCP n'est pas destiné à remplacer le mode d'emploi, qui est le principal document permettant de garantir une utilisation sûre du dispositif, ni à fournir des suggestions diagnostiques ou thérapeutiques aux utilisateurs auxquels le dispositif est destiné ou aux patients. Ce SSCP n'est pas destiné à remplacer les informations obligatoires figurant sur les cartes d'implant ou dans tout autre document obligatoire.

### **1.1 Utilisation prévue du dispositif**

#### **1.1.1 Utilisation prévue**

Le FemoSeal™ Vascular Closure System est un dispositif médical destiné à la fermeture d'une ponction artérielle après cathétérisme percutané par l'artère fémorale commune.

#### **1.1.2 Indications d'utilisation**

Le FemoSeal™ Vascular Closure System est indiqué pour la fermeture de la ponction artérielle dans l'artère fémorale commune (artériotomie) chez des patients qui ont subi un cathétérisme percutané à l'aide d'une gaine procédurale de 7F (2,33 mm) ou moins.

#### **1.1.3 Contre-indications et/ou limitations**

Le FemoSeal™ Vascular Closure System est contre-indiqué chez les patients qui ont subi une artériotomie où des gaines ou des dispositifs de plus de 2,33 mm (7F) ont été utilisés.

#### **1.1.4 Populations cibles de patients**

La sécurité et l'efficacité du FemoSeal™ Vascular Closure System ont été établies chez les patients âgés de 18 ans et plus qui ont subi un cathétérisme percutané à l'aide d'une gaine procédurale de 2,33 mm (7F) ou moins.

#### **1.1.5 Populations spéciales de patients**

L'innocuité et l'efficacité du FemoSeal™ Vascular Closure System n'ont pas été établies chez les populations de patients suivantes :

- Patients atteints d'une maladie auto-immune préexistante.
- Patients subissant une thrombolyse thérapeutique.
- Patients atteints d'une maladie vasculaire périphérique cliniquement significative.
- Patients souffrant d'hypertension non contrôlée (systolique > 220 mmHg ou diastolique > 110 mmHg).

- Patients présentant des troubles hémorragiques, y compris une thrombocytopénie ( $< 100\,000$  plaquettes) ou une anémie ( $\text{Hgb} < 10 \text{ mg/dl}$ ).
- Patients ayant une lumière interne de l'artère fémorale commune inférieure à 5 mm.
- Patients souffrant d'insuffisance rénale et/ou hépatique.
- Patients présentant d'autres comorbidités pertinentes.
- Population d'une origine raciale et/ou ethnique spécifique.
- Patients ayant présenté un infarctus du myocarde dans les 72 heures.
- Patients ayant une endoprothèse vasculaire ou un stent sur le site de ponction.
- Patientes enceintes ou allaitantes.
- Patients de moins de 18 ans.

### 1.1.6 Utilisateurs auxquels le dispositif est destiné

Les utilisateurs auxquels le FemoSeal™ Vascular Closure System est destiné sont des médecins qui ont suivi une formation leur permettant d'effectuer un accès et une fermeture artériels pour des procédures endovasculaires par le biais de l'artère fémorale commune et qui ont participé à un programme de formation pour médecins FemoSeal™ de Terumo Medical Corporation.

## 1.2 Description du dispositif

### 1.2.1 Description du dispositif

Le FemoSeal™ Vascular Closure System, fabriqué par Terumo Medical Corporation (TMC), est un dispositif de fermeture vasculaire résorbable conçu pour obtenir une hémostase de l'artère fémorale après cathétérisme percutané par l'artère fémorale commune.

Le dispositif de fermeture FemoSeal™ se compose de deux disques en polymère résorbable, le joint interne et le disque externe de verrouillage, qui sont maintenus ensemble par un multifilament résorbable, scellant ainsi mécaniquement l'artériotomie (voir **Schéma 1.1** et **Schéma 1.2**). Après son déploiement dans la gaine du boîtier conique, le disque de verrouillage externe est compacté sur la tige multifilament, ce qui entraîne la fermeture mécanique du site de ponction entre les disques de verrouillage interne et externe. Le disque d'étanchéité intérieur et le disque de verrouillage extérieur sont maintenus en place par friction sur la tige multifilament. L'hémostase est obtenue par des moyens mécaniques. Les éléments de fermeture sont dégradés par hydrolyse.

Les composants de fermeture implantables, le joint interne et le disque externe de verrouillage, sont dégradés en dix-huit (18) mois tandis que le multifilament est dégradé et absorbé par

hydrolyse par les tissus environnants après environ deux (2) à trois (3) ans. La capacité des composants de fermeture implantables à maintenir la compression sur l'artériotomie a été testée jusqu'à huit (8) heures. Les produits de dégradation sont métabolisés et excrétés dans l'urine ou expirés sous forme de dioxyde de carbone par les poumons. Aucun effet d'accumulation n'a été observé dans les études animales. Les composants supplémentaires de FemoSeal™ qui entreront en contact avec des tissus vivants ou du sang pendant l'intervention sont la gaine du boîtier conique, le dilateur, la tubulure de protection, le poussoir et le fil-guide.

**Schéma 1.1 Joint intérieur et disque de verrouillage externe, respectivement**

**Schéma 1.2 Joint intérieur et disque de verrouillage externe déployés**

L'unité FemoSeal™ est emballée avec un dilateur et un fil-guide de 0,038" (0,97 mm) de diamètre extérieur, de 27,5" (70 cm) de long et un redresseur en forme de J (voir **Schéma 1.3** ci-dessous). Le fil-guide est contenu dans une tubulure en polyéthylène. Toutes les pièces sont emballées dans un plateau en papier fixe. L'emballage comprend également la carte d'implant du patient. Le FemoSeal™ Vascular Closure System ne nécessite pas d'accessoires supplémentaires pour que le dispositif fonctionne comme prévu et le dispositif est uniquement destiné à être utilisé avec le dilateur et le fil-guide inclus dans le conditionnement du produit.

### Schéma 1.3 Unité FemoSeal™ VCS avec fil-guide et dilateur

#### 1.2.2 Matières premières et composants

Le **Tableau 1.1** ci-dessous répertorie les composants du FemoSeal™ VCS.

**Tableau 1.1 Matières premières et composants du FemoSeal™ VCS**

\* Partie implantable de l'appareil ; les composants implantables sont compatibles avec l'IRM

Le FemoSeal™ VCS est stérilisé à l'oxyde d'éthylène (OE) et est un dispositif médical à usage unique. Le FemoSeal™ VCS est conçu de manière à ne pas pouvoir être réutilisé.

### **Mode de fonctionnement**

Le FemoSeal™ VCS favorise l'hémostase mécanique en déployant des éléments de fermeture implantables à l'intérieur et à l'extérieur de l'artère fémorale commune. Le joint interne ferme hermétiquement le site de ponction et le disque externe maintient le joint interne en place, empêchant le saignement.

### 1.2.3 Bénéfice clinique

Le FemoSeal™ VCS offre les bénéfices cliniques suivants par rapport à la fermeture vasculaire après une ponction artérielle dans l'artère fémorale commune :

- Réduction du délai avant l'hémostase <sup>1</sup>
- Réduction du délai avant la déambulation <sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### 1.2.4 Génération(s) précédente(s) ou variantes

- La première version du FemoSeal™ VCS (#11200) a été vendue sur le marché européen au cours de l'année 2005 et de l'année 2006.
- Le FemoSeal™ VCS actuel (#11202), avec un système de distribution amélioré, est sur le marché depuis le 28 mars 2006.

### 1.2.5 Accessoires destinés à être utilisés en combinaison avec le dispositif

L'unité FemoSeal™ est emballée avec un dilateur et un fil-guide de 0,038" (0,97 mm) de diamètre extérieur, de 27,5" (70 cm) de long et un redresseur en forme de J. Le fil-guide est un accessoire de l'unité FemoSeal™. Le redresseur en forme de J est un composant du fil-guide, tandis que le dilateur est un composant de l'unité FemoSeal™. Le fil-guide est le seul accessoire pris en compte. Le fil-guide est contenu dans une tubulure en polyéthylène. Toutes les pièces sont emballées dans un plateau en papier fixe. L'emballage comprend également la carte d'implant du patient. Le FemoSeal™ Vascular Closure System ne nécessite pas d'accessoires supplémentaires pour que le dispositif fonctionne comme prévu et le dispositif est uniquement destiné à être utilisé avec le dilateur et le fil-guide inclus dans le conditionnement du produit.

### 1.2.6 Autres dispositifs et produits destinés à être utilisés en combinaison avec le dispositif

Le FemoSeal™ VCS ne nécessite pas d'appareils supplémentaires pour fonctionner comme prévu.

## 1.3 Risques et avertissements

### 1.3.1 Risques résiduels et effets indésirables

Les effets indésirables, les dommages et les complications connus ou prévisibles liés à l'utilisation du FemoSeal™ VCS en raison d'un risque résiduel sont énumérés dans le **Tableau 1.2**. Le taux d'occurrence se base sur une analyse de la documentation sur les risques et est calculé sur la base des données de surveillance post-commercialisation obtenues du

1<sup>er</sup> septembre 2019 au 31 août 2024. Il n'y a pas de risques résiduels inconnus pour le FemoSeal™ VCS et tous les risques applicables ont été traités par le biais du mode d'emploi et du processus de gestion des risques.

**Tableau 1.2. Événements indésirables/complications du FemoSeal**

| Domage                                                  | Taux de fréquence (%) | Facteurs d'atténuation                                                                                                                                                                                                               |
|---------------------------------------------------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Réaction allergique                                     | 0,0000                | Les mesures et les plans visant à réduire les risques au minimum ont été pris en compte dans les caractéristiques de conception des produits, les directives de fabrication, l'étiquetage des produits et la formation des médecins. |
| Anévrisme                                               | 0,0000                |                                                                                                                                                                                                                                      |

### 1.3.2 Avertissements et mises en garde

#### Avertissements

1. Ne pas utiliser si l'emballage a été endommagé ou si une barrière stérile n'est pas intacte.
2. Ne pas utiliser après la date de péremption – les composants biodégradables risquent de ne pas fonctionner correctement.
3. Ne pas utiliser si un élément semble endommagé ou défectueux de quelque manière que ce soit.
4. L'utilisation du FemoSeal™ Vascular Closure System en cas de contamination bactérienne de la gaine procédurale ou des tissus environnants peut provoquer une infection.
5. En cas de suspicion de ponction de la paroi artérielle postérieure ou de plus d'une ponction artérielle, ne pas se fier uniquement au FemoSeal™ Vascular Closure System pour obtenir une hémostase artérielle. Utiliser une compression manuelle ou mécanique supplémentaire.
6. Si le site de ponction se trouve au niveau de la bifurcation de l'artère fémorale ou à proximité de celle-ci, le FemoSeal™ Vascular Closure System ne doit pas être utilisé en raison du risque de mauvais positionnement du joint interne. Cet événement peut entraîner des hémorragies et/ou perturber le débit de sang normal.
7. En cas de saignement artériel persistant au niveau du site d'incision, ne pas couper le multifilament avant d'avoir obtenu l'hémostase. Si l'hémostase n'est pas obtenue, fixer le multifilament à l'aide d'un pansement stérile et appliquer une compression supplémentaire jusqu'à obtention de l'hémostase. En cas d'hémorragie artérielle persistante, des complications hémorragiques importantes peuvent survenir et entraîner des blessures ou le décès du patient.
8. Ne pas utiliser le FemoSeal™ Vascular Closure System si le site de ponction se trouve à proximité du ligament inguinal, car cela pourrait entraîner un hématome rétro-péritonéal.
9. Les patients présentant un risque plus élevé de saignement peuvent subir une perte sanguine accrue, nécessitant une transfusion.
10. Si le disque interne se détache, il peut entraîner un événement thrombotique et/ou embolique.

#### Précautions

1. Le FemoSeal™ Vascular Closure System doit être déployé par des praticiens ayant suivi une formation adéquate sur l'utilisation de l'appareil.

2. Effectuer une angiographie fémorale limitée ou une ponction fémorale guidée par échographie avant de déployer le FemoSeal™ Vascular Closure System.
3. Interrompre la procédure si :
  - le diamètre de la lumière de l'artère fémorale commune < 5 mm,
  - une sténose et/ou une plaque significative sont présentes à proximité du site de ponction de l'artère fémorale commune,
  - la ponction artérielle se situe au niveau de la bifurcation de l'artère fémorale ou à proximité de celle-ci,
  - des branches anormales ou des vaisseaux anormaux se trouvent à proximité du site de ponction de l'artère fémorale commune.
4. En cas d'hématome, une attention particulière doit être portée à l'insertion correcte de la gaine du boîtier conique dans l'artère.
5. Utiliser une méthode de ponction en simple paroi. Ne pas pratiquer de ponction sur la paroi postérieure de l'artère.
6. Toujours respecter une technique stérile lors de l'utilisation du FemoSeal™ Vascular Closure System.
7. Le FemoSeal™ Vascular Closure System est à usage unique et ne doit en aucun cas être réutilisé ou restérilisé. L'unité FemoSeal™ est conçue de manière à ne pas pouvoir être réutilisée.
8. Si le déploiement du joint intérieur rencontre une résistance inattendue, interrompre la procédure.
9. Pour un déploiement correct du joint intérieur, repositionner le pousseur de sorte que le bouton puisse revenir librement en arrière.
10. S'assurer que l'extrémité de la gaine du boîtier conique de l'unité FemoSeal™ se trouve sous la surface de la peau avant de déployer le disque externe de verrouillage. Le disque externe de verrouillage peut être déployé par inadvertance au-dessus du niveau de la peau chez les patients présentant une courte distance entre l'artère fémorale et le niveau de la peau.
11. Pour un déploiement correct, une incision cutanée peut être nécessaire avant le déploiement.
12. Si le joint intérieur se trouve à l'intérieur de l'artère, mais qu'il n'est pas possible d'enfoncer complètement le bouton et de déployer le disque externe de verrouillage, une intervention chirurgicale peut être nécessaire pour retirer les éléments de fermeture FemoSeal™.

13. Si une nouvelle ponction de la même artère fémorale s'avère nécessaire dans les 18 mois, elle doit être effectuée à au moins un centimètre du site d'accès précédent du FemoSeal™ Vascular Closure System.
14. Demander au patient de suivre les instructions du médecin concernant l'inspection du site de fermeture.
15. Demander au patient de porter la carte d'information du patient pendant les 18 prochains mois

### **Précautions au moment de la sortie**

Avant d'envisager la sortie, évaluer l'état du patient en ce qui concerne les conditions cliniques suivantes :

1. Saignement et/ou hématome au niveau du site de fermeture.
2. Douleur à la marche.
3. Signes d'infection au niveau du site de fermeture.

### **1.3.3 Mesures correctives de sécurité sur le terrain**

Une mesure corrective de sécurité a été prise sur le terrain concernant le FemoSeal™ VCS entre le 1<sup>er</sup> septembre 2019 et le 31 août 2024.

En 2022, Terumo a volontairement rappelé le FemoSeal™ VCS en raison de plaintes alléguant des échecs lors des tests des processus et de commercialisation de lots de produits FemoSeal fabriqués par Elkton pour la mesure de la force de compression et de la force de rétraction. Au total, 950 unités ont été rappelées en Corée du Sud.

## **1.4 Évaluation clinique et suivi clinique post-commercialisation**

Le **Tableau 1.3** comprend une liste d'études pivots incluses pour mettre le FemoSeal™ VCS sur le marché ainsi que des études post-commercialisation et des activités de suivi clinique post-commercialisation. La version de l'appareil utilisée dans l'étude est incluse dans le tableau ci-dessous. La première version du FemoSeal™ VCS (#11200) a été commercialisée jusqu'en 2006, tandis que la version suivante (#C11202) a été mise sur le marché en 2006 et est toujours commercialisée à l'heure actuelle.

| Medical System AB<br>(performed by<br>Biomatech, France). |  |  | artérielle pour obtenir l'hémostase. Un des disques a pénétré dans l'orifice de ponction et l'autre a serré le disque interne depuis l'extérieur de l'artère. Les deux disques ont été insérés par le biais d'un introducteur. Les disques ont été conçus pour empêcher les saignements, guérir dans la paroi vasculaire et finalement se dégrader et être absorbés. L'étude a été conçue pour recueillir et analyser des données après l'implantation fonctionnelle chez le mouton et le porc afin d'évaluer la capacité de l'implant à maintenir la fonction physiologique lorsqu'il est utilisé dans le système circulatoire, de déterminer la réaction de l'hôte et du dispositif (intégrité physique, encapsulation tissulaire au sacrifice) et d'évaluer la dégradation de l'implant. | 8 éléments de fermeture implantés chez 2 moutons<br><br>2 éléments de fermeture implantés chez 1 porc<br><br>Lorsque deux éléments de fermeture ont été implantés dans la même artère fémorale, ils ont été implantés à une distance > 30 mm | mettant particulièrement l'accent sur l'encapsulation du disque interne.<br><br>Sur le plan macroscopique, aucun signe significatif d'intolérance locale ou de formation de thrombus n'a été observé. L'observation macroscopique n'a pas mis en évidence de différence entre les moutons et le porc après implantation des éléments de fermeture dans les artères fémorales. Sur le plan macroscopique, aucun signe significatif d'intolérance locale ou de formation de thrombus n'a été observé. L'observation macroscopique n'a pas mis en évidence de différence entre les moutons et le porc après implantation des éléments de fermeture dans les artères fémorales.<br><br>L'analyse histopatologique du site d'implantation chez le mouton n'a montré aucun effet indésirable local. Les disques intérieur et extérieur présentaient des signes de dégradation et, dans certains cas, étaient cassés en plus petites parties. Les disques internes ont été complètement intégrés dans le tissu néo-intimal. Chez le porc, l'analyse histopatologique a montré un peu plus de signes inflammatoires autour des disques interne et externe. Chez les deux animaux, le multifilament présentait un peu plus de signes d'inflammation que dans |

Dans le cadre du plan de développement avant commercialisation du FemoSeal™ VCS, trois tests fonctionnels ont été réalisés sur des animaux. En 2000, avant de commencer les études cliniques, une étude sur des animaux a été réalisée pour évaluer la biofonctionnalité du FemoSeal™ VCS. Cette étude a évalué la capacité des éléments de fermeture à maintenir la fonction physiologique et à évaluer leur dégradation. À 18 mois, les disques interne et externe n'étaient plus visibles, après avoir été remplacés par un tissu fibreux endoluminal.

En conclusion, la capacité de l'élément de fermeture du FemoSeal™ VCS à maintenir la fonction physiologique lorsqu'il est utilisé dans le système circulatoire a été confirmée.

En 2002, une étude sur des animaux a été réalisée pour évaluer la biocompatibilité et la biofonctionnalité d'un implant biodégradable, le FemoSeal™ VCS, conçu pour atteindre l'hémostase dans le système vasculaire. En résumé, la dégradation de l'implant était presque terminée après 36 semaines et il n'y avait pas de réaction tissulaire indésirable significative.

Une autre étude sur des animaux, réalisée en 2002, a évalué la biocompatibilité et la biofonctionnalité d'un implant biodégradable, le FemoSeal™ VCS, conçu pour obtenir l'hémostase dans le système vasculaire. Après 5 semaines, l'encapsulation du disque était terminée et des signes de dégradation ont été observés pour les disques internes et externes. En conclusion, la capacité de l'implant à maintenir la fonction physiologique lorsqu'il est utilisé dans le système circulatoire a été confirmée.

Dans le cadre du plan de développement clinique du FemoSeal™ VCS, Radi Medical System AB a mené une étude clinique avant la mise sur le marché. Cette étude clinique n'a pas été publiée et n'est pas disponible en ligne. L'étude portant sur le modèle #11200 a été menée entre 2002 et 2004 dans le cadre de la norme européenne EN 540 (Investigation clinique des dispositifs médicaux sur les sujets humains) et conformément aux Considérations générales de l'ICH relatives aux essais cliniques et aux directives de bonnes pratiques cliniques. Les détails de cette étude sont documentés dans le rapport EU-SE-001. L'étude clinique a été documentée dans le rapport final de Radi Medical Systems AB, « Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures ». L'étude clinique a été réalisée avec le premier modèle #11200 de FemoSeal et s'est concentrée sur la sécurité et l'efficacité des composants de fermeture implantables. La seule différence entre le premier modèle #11200 et le modèle actuel, C11202, est la taille française, respectivement 6F et 7F, et l'amélioration du système de distribution. Les bénéfices cliniques, l'utilisation prévue, le mode de fonctionnement et les matières premières des éléments de fermeture implantables, du joint interne et du disque externe de verrouillage restent inchangés.

L'appareil a été conçu pour être utilisé comme point d'accès dans l'artère fémorale chez des patients qui subissent un examen cardiaque de diagnostic ou une intervention cardiaque. L'objectif de cette étude était de déterminer la sécurité, les performances et l'efficacité du FemoSeal™ VCS. Il s'agissait d'une étude ouverte, prospective, multicentrique, à un groupe avec un suivi à 30 jours.

Le critère d'évaluation principal de la performance était le délai avant l'hémostase, défini comme l'absence de saignements rapides. Le critère d'évaluation principal de l'innocuité était l'incidence des complications vasculaires majeures pendant 30 jours. Les critères d'évaluation secondaires comprenaient le délai avant la déambulation, la proportion d'échecs du traitement,

la fréquence des événements indésirables et les caractéristiques de performance de l'appareil pendant l'administration et le déploiement.

Les patients inclus dans cette étude étaient des adultes capables de fournir un consentement éclairé et ayant au moins un pouls pédieux intact. Les patients ont été exclus de l'étude s'ils présentaient l'une des pathologies suivantes :

- Antécédents de maladie vasculaire périphérique
- Maladie auto-immune
- Trouble hémorragique connu de l'anémie sévère
- INR > 1,5
- Infarctus du myocarde dans les 72 heures
- Hypertension non contrôlée malgré le traitement
- Obésité empêchant l'accès avec la technique de Seldinger
- Présence d'une endoprothèse vasculaire ou d'un stent au niveau du site de l'artériotomie
- Ponction ipsilatérale précédente dans les 3 mois
- Espérance de vie < 6 mois

En outre, les patients ont été examinés en peropératoire et exclus de l'étude si l'une des conditions suivantes était observée :

- Diamètre de la lumière de l'artère fémorale commune < 5 mm
- Branches artérielles à moins de 2 cm du site de ponction
- Sténose significative à 3 cm du site de ponction
- Utilisation d'un introducteur principal > 6 Fr
- Ponction au niveau de la bifurcation fémorale ou à proximité de celle-ci
- Ponctions fémorales multiples
- Ponction connue ou suspectée de la paroi fémorale postérieure
- Hématome important (2:6 cm) à la fin de la procédure
- Insertion difficile de l'introducteur principal pour l'intervention en raison d'un tissu ou d'un vaisseau tortueux

Cette étude à protocole unique a été menée en deux parties : 20 patients ont été recrutés pendant la Partie 1, puis une analyse de l'innocuité a été réalisée et 60 patients supplémentaires ont été recrutés pendant la Partie 2.

Dans la partie 1, l'âge moyen des patients recrutés était de 65,9 ans, 70 % des patients étaient des hommes et 95 % des patients avaient un traitement concomitant. Dans la partie 2 de l'étude, l'âge moyen était de 63,8 ans, 78 % étaient des hommes et 100 % avaient un traitement concomitant.

Les patients subissant des procédures de cathétérisme cardiaque diagnostique (Partie 1 et Partie 2) ou interventionnel (Partie 2) étaient éligibles pour participer à l'étude. Les procédures étaient conformes aux normes de soins dans chacun des hôpitaux participants, suivies de l'utilisation du FemoSeal™ VCS. Les données des patients ont été recueillies à l'entrée dans l'étude, pendant la procédure et 1 jour puis 30 jours après la procédure. Les résultats sont résumés dans le **Tableau 1.5** et indiquent que le FemoSeal™ VCS est sûr et efficace pour cette population de patients.

**Tableau 1.5 Résultats cliniques rapportés lors de l'étude pré-commercialisation**

|                                                                                                                               | Partie <sup>o</sup> 1 | Partie <sup>o</sup> 2     |
|-------------------------------------------------------------------------------------------------------------------------------|-----------------------|---------------------------|
| Nombre de patients                                                                                                            | 20                    | 60                        |
| Temps moyen avant l'hémostase                                                                                                 | 1,2 minute            | 1,6 minute <sup>a</sup>   |
| Temps moyen avant la déambulation                                                                                             | 72,2 minutes          | 87,5 minutes <sup>b</sup> |
| Incidence des complications vasculaires majeures <sup>c</sup>                                                                 | 0 (0 %)               | 1 (2 %)                   |
| Nombre de patients présentant des événements indésirables                                                                     | 5 (25 %)              | 19 (32 %)                 |
| Échec du traitement (défini par des complications vasculaires majeures, la nécessité d'une compression manuelle, ou les deux) | 0 (0 %)               | 3 (5 %)                   |
| Dysfonctionnements de l'appareil                                                                                              | 0 (0 %)               | 6 (10 %)                  |

<sup>a</sup> Sur la base d'un échantillon total de 58 patients, car 2 patients n'ont pas atteint l'hémostase au moment de l'intervention en raison de ponctions ipsilatérales antérieures. L'hémostase a été obtenue à 7 minutes et 37 minutes pour ces patients.

<sup>b</sup> Sur la base d'un échantillon total de 59 patients : 1 patient n'a pas été inclus, car il a été placé sous respirateur en raison d'un œdème pulmonaire et a été incapable de se déplacer pendant plus d'une semaine.

<sup>c</sup> Définie comme une complication vasculaire nécessitant une transfusion sanguine ou une intervention chirurgicale, une infection locale nécessitant l'administration d'une antibiothérapie, une hospitalisation ou une prolongation de l'hospitalisation ou un débridement du site

Aucune complication vasculaire majeure n'a été observée dans la Partie 1 de l'étude. Une complication vasculaire majeure a été signalée dans la Partie 2 de l'étude : un pseudo-anévrisme qui a été signalé un jour après la procédure. L'événement a nécessité une compression guidée par échographie et une injection de thrombine dans le pseudoanévrisme et a prolongé l'hospitalisation du patient.

Sur les cinq événements indésirables signalés dans la Partie 1 de l'étude, il y a eu un événement indésirable possible lié au dispositif : un événement non grave de saignement rapide 1 jour après la procédure. Sur les 19 événements indésirables rapportés dans la Partie 2 de l'étude, trois événements indésirables non graves d'hématome lié au dispositif ont été observés et six événements non graves potentiellement liés au dispositif ont été observés, notamment trois rapports de suintement persistant, deux hématomes et une douleur à la jambe après l'exercice.

Trois patients ont été considérés comme des échecs thérapeutiques dans la Partie 2 : Deux en raison de l'absence d'hémostase sans recours à la compression et un en raison de la complication vasculaire majeure (pseudoanévrisme). Il n'y a pas eu d'échec thérapeutique dans la Partie 1 de l'étude.

Sur les six dysfonctionnements de l'appareil dans la Partie 2 de l'étude, trois n'ont pas interféré avec l'intervention, un a été attribué à une erreur de l'utilisateur, un a fui de l'introducteur et l'autre était une rupture de l'articulation du filament. Les deux derniers problèmes ont été traités avec des mises à jour de modèles mises en œuvre dans C11202.

La Partie 2 de l'étude clinique pré-commercialisation n'a pas rapporté les résultats de suivi à 6 mois en raison de la non-observance du patient. L'étude clinique pré-commercialisation (EU-SE-001) à 30 jours, ce qui est conforme à la période de suivi de la littérature clinique, démontre que le FemoSeal™ VCS est sûr et efficace.

#### 1.4.2 Résumé des données issues des études cliniques post-commercialisation

Quatre études cliniques post-commercialisation ont été menées à bien et sont décrites dans le **Tableau 1.6** ci-dessous. Ces études cliniques n'ont pas été publiées et ne sont pas disponibles en ligne.

**Tableau 1.6 Études cliniques post-commercialisation terminées**
