| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Utført av Biomatech, Frankrike | Dyrestudie | Formålet med studien var å evaluere biokompatibiliteten og biofunksjonaliteten til et biologisk nedbrytbart implantat designet for å oppnå hemostase i det vaskulære systemet. Den testede enheten var ment å føres inn i punksjonshullet i arteriene for å oppnå hemostase. Den ene skiven gikk inn i punksjonshullet i arterien, og den andre strammet den indre skiven fra utsiden av arterien. Begge skivene ble ført inn gjennom en innføringshylse. Skivene ble designet for å forhindre blødning, for å leges inn i karveggen og til slutt brytes de ned og absorberes. Studien var utformet for å samle inn og analysere data etter funksjonell implantasjon hos sau og gris for å evaluere implantatets kapasitet til å opprettholde fysiologisk funksjon ved bruk i sirkulasjonssystemet, for å bestemme vertens respons og enhetens respons (fysisk integritet, vevsinnekapling ved ofring) og for å evaluere nedbrytningen av implantatet | Implantasjonsperiode/oppfølging er 5 uker for alle dyr<br><br>4 sauer, 1 gris<br><br>14 lukkeelementer<br><br>8 lukkeelementer implantert i 2 sauer,<br><br>2 lukkeelementer implantert i 1 gris<br><br>Når to lukkeelementer ble implantert i samme femoralarterie, ble de implantert med en avstand på > 30 mm | Eventuelle bivirkninger (inflammasjon, nekrose, blødning eller andre lesjoner) eller eventuell tynn pseudointimal lagdannelse ble registrert. Det ble lagt spesiell vekt på første vevsintegrering av enheten, med spesiell vekt på innkapslingen av den innvendige skiven.<br><br>Makroskopisk ble det ikke observert signifikante tegn på lokal intoleranse eller trombedannelse. Den makroskopiske observasjonen viste ingen forskjell mellom sauen eller grisen etter implantasjon av lukkeelementene i lårarteriene. Makroskopisk ble det ikke observert signifikante tegn på lokal intoleranse eller trombedannelse. Den makroskopiske observasjonen viste ingen forskjell mellom sauen eller grisen etter implantasjon av lukkeelementene i lårarteriene.<br><br>Den histopatologiske analysen av implantasjonsstedet hos sau viste ingen lokale bivirkninger. De indre og ytre skivene viste tegn på nedbrytning og ble i noen tilfeller brutt ned i mindre deler. De indre skivene var fullstendig integreert i neointimalt vev. Hos grisen viste den histopatologiske analysen litt mer inflammatoriske tegn rundt de indre og ytre |

|                                                                                                                                                                                                              |                              |                                   |                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                               | <p>skivene. Hos begge dyr viste multifilamentet litt flere inflammatoriske tegn enn hos skivematerialet, noe som er normalt for flettede suturer på grunn av det større overflateområdet.</p> <p>Karets åpenhet ble målt etter 5 uker ved bruk av tre ulike metoder, histomorfometrisk, histomorfometrisk i kombinasjon med måling av kardiameter ved bruk av skyvelære og ved bruk av doppler-ultralyd med farger. Gjennomsnittlig åpenhet i blodkar hos sau var mellom 60 og 80 %, avhengig av metode (12 observasjoner). Hos grisen var middelverdi for åpenhet i blodkar mellom 40 og 80 % (2 observasjoner).</p> |

Som en del av utviklingsplanen før markedsføring av FemoSeal™ VCS, ble det gjennomført 3 funksjonelle tester på dyr. I 2000, før oppstart av kliniske studier, ble det utført en dyrestudie for å evaluere biofunksjonaliteten til FemoSeal™ VCS. Denne studien evaluerte lukkeelementenes kapasitet til å opprettholde fysiologisk funksjon, og evaluerte nedbrytningen av dem. Ved 18 måneder var det indre og ytre skivematerialet ikke lenger synlig, etter å ha blitt erstattet med et endoluminalt fibrøst vev. Konklusjonen var at FemoSeal™ VCS-lukkeelementets kapasitet til å opprettholde fysiologisk funksjon når det brukes i sirkulasjonssystemet, ble bekreftet.

I 2002 ble det utført en dyrestudie for å evaluere biokompatibiliteten og biofunksjonaliteten til et biologisk nedbrytbart implantat, FemoSeal™ VCS, designet for å oppnå hemostase i det vaskulære systemet. Kort oppsummert var nedbrytningen av implantatet nesten fullstendig etter 36 uker, og det var ingen signifikant vevsreaksjon.

En annen dyrestudie i 2002 evaluerte biokompatibiliteten og biofunksjonaliteten til et biologisk nedbrytbart implantat, FemoSeal™ VCS, designet for å oppnå hemostase i det vaskulære systemet. Etter 5 uker var innkapslingen av skiven fullført, og tegn på nedbrytning ble observert for indre og ytre skiver. Konklusjonen var at implantatets kapasitet til å opprettholde fysiologisk funksjon når det ble brukt i sirkulasjonssystemet, ble bekreftet.

Som en del av den kliniske utviklingsplanen for FemoSeal™ VCS utførte Radi Medical System AB en klinisk undersøkelse før markedsføring. Denne kliniske undersøkelsen er ikke publisert eller tilgjengelig på nettet. Studien med enhetsmodell #11200 ble utført i 2002–2004 under europeisk standard EN 540 (Klinisk undersøkelse av medisinsk utstyr for mennesker) og i samsvar med ICH General Considerations for Clinical Trials and Guideline for Good Clinical Practice. Detaljene i denne studien er dokumentert i rapport EU-SE-001. Den kliniske studien ble dokumentert i den endelige rapporten fra Radi Medical Systems AB; "Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures". Den kliniske studien ble utført med den første modellen av FemoSeal™, nr. 11200, og fokuserte på sikkerheten og effekten til de implanterbare lukkekomponentene. Den eneste forskjellen mellom den første modellen, nr. 11200, og den nåværende modellen, C11202, er den franske størrelsen, henholdsvis 6 F og 7 F, og det forbedrede innføringssystemet. De kliniske fordelene, tiltenkt bruk, operasjonsprinsipper og råmaterialene i de implanterbare lukkeelementene, den indre forseglingen og den ytre sperreskiven forblir uendret.

Tiltenkt bruk av enheten var for pasienter som gjennomgikk diagnostiske hjerteprosedyrer eller intervensjonelle hjerteprosedyrer med lårarterien som et tilgangspunkt. Formålet med denne studien var å fastslå sikkerhet, ytelse og effekt av FemoSeal™ VCS. Dette var en prospektiv, multisenter, enkeltarm, åpen studie med 30 dagers oppfølging.

Det primære ytelsesendepunktet var tid til hemostase definert som fravær av aktiv blødning. Det primære sikkerhetsendepunktet var forekomst av alvorlige vaskulære komplikasjoner i løpet av 30 dager. Sekundære endepunkter inkluderte tid til ambulering, andel behandlingssvikt, forekomst av bivirkninger og enhetens ytelseskarakteristikker under innføring og plassering.

Pasientene i denne studien var voksne som var i stand til å gi informert samtykke, og med minst én intakt pedalpuls. Pasientene ble ekskludert fra studien hvis de hadde noen av følgende tilstander:

- Tidligere perifer karsykdom
- Autoimmune sykdommer

- Kjent blødningsforstyrrelse eller alvorlig anemi
- INR >1,5
- Hjerteinfarkt de siste 72 timer
- Ukontrollert hypertensjon til tross for behandling
- Fedme som hindret tilgang med Seldinger-teknikk
- Tilstedeværelse av vaskulært transplantat eller en stent på arteriotomistedet
- Tidligere ipsilateral punksjon innen 3 måneder
- Forventet levetid < 6 måneder

I tillegg ble pasientene undersøkt intraoperativt og ekskludert fra studien hvis noe av det følgende ble observert:

- Hovedlårarteriens lumendiameter < 5 mm
- Arteriegrener innen 2 cm proksimalt for punksjonsstedet
- Signifikant stenose innen 3 cm fra punksjonsstedet
- Bruk av primær innføringshylse > 6 Fr
- Punktering ved eller distalt for forgreningen av lårarterien
- Flere punksjoner i lårarterien
- Kjent eller mistenkt posterior punksjon av lårarterieveggen
- Stort hematom (2:6 cm) ved fullføring av prosedyren
- Vanskelig innføring av primærhylse for prosedyre på grunn av buktende vev eller blodkar

Denne enkeltprotokollstudien ble utført i to deler: 20 pasienter ble inkludert i del 1, deretter ble det utført en sikkerhetsanalyse, og deretter ble ytterligere 60 pasienter inkludert i del 2.

I del 1 var gjennomsnittlig alder for inkluderte pasienter 65,9 år, 70,0 % av pasientene var menn og 95 % av pasientene brukte samtidig medisiner. I del 2 av studien var gjennomsnittsalderen 63,8 år, 78 % var menn og 100 % brukte samtidig medisiner.

Pasienter som gjennomgikk diagnostiske (del 1 og del 2) eller intervensjonelle (del 2) hjertekateteriseringsprosedyrer, var kvalifisert for deltakelse i studien. Prosedyrene var i samsvar med standard pleie ved hvert av de deltagende sykehusene, etterfulgt av bruk av FemoSeal™ VCS. Pasientdata ble samlet inn ved baseline, under prosedyren og 1 dag og 30 dager etter prosedyren. Resultatene er oppsummert i **tabell 1.5** og indikerer at FemoSeal™ VCS er sikker og effektiv for bruk i denne pasientpopulasjonen.

**Tabell 1.5 Kliniske resultater rapportert i studien før markedsføring**

| Gjennomsnittlig tid til hemostase                                                                                 | 1,2 minutter  | 1,6 minutter <sup>a</sup>  |
| Gjennomsnittlig tid til ambulering                                                                                | 72,2 minutter | 87,5 minutter <sup>b</sup> |
| Forekomst av større vaskulære komplikasjoner <sup>c</sup>                                                         | 0 (0 %)       | 1 (2 %)                    |
| Antall pasienter med bivirkninger                                                                                 | 5 (25 %)      | 19 (32 %)                  |
| Behandlingsfeil (definert som alvorlige vaskulære komplikasjoner, behov for manuell kompresjon eller begge deler) | 0 (0 %)       | 3 (5 %)                    |
| Feil på enheten                                                                                                   | 0 (0 %)       | 6 (10 %)                   |

<sup>a</sup>Basert på en total prøvestørrelse på 58 fordi 2 pasienter ikke oppnådde hemostase på prosedyretidspunktet på grunn av tidligere ipsilaterale punksjoner. Hemostase ble oppnådd etter 7 minutter og 37 minutter for disse pasientene.

<sup>b</sup>Basert på total prøvestørrelse på 59: 1 pasient ble ikke inkludert fordi pasienten ble lagt i respirator på grunn av lungeødem og ikke kunne ambulere på over en uke.

<sup>c</sup>Definert som vaskulær komplikasjon som krever blodtransfusjon eller kirurgisk reparasjon, eller lokal infeksjon som krever administrasjon av antibiotika, sykehusinnleggelse eller forlengelse av sykehusoppholdet, eller debridering av stedet

Ingen større vaskulære komplikasjoner ble observert i del 1 av studien. Det ble rapportert om 1 større vaskulær komplikasjon i del 2 av studien: pseudoaneurisme som ble rapportert innen 1 dag etter prosedyren. Hendelsen krevde ultralydveiledet kompresjon og en injeksjon av trombin i pseudoaneurismen, og forlenget pasientens sykehusopphold.

Av de 5 bivirkningene som ble rapportert i del 1 av studien, var det én mulig utstyrsrelatert bivirkning: en ikke-alvorlig hendelse med aktiv blødning 1 dag etter prosedyren. Av de 19 bivirkningene som ble rapportert i del 2 av studien, ble det observert 3 enhetsrelaterte, ikke-alvorlige bivirkninger med hematom, og 6 mulige enhetsrelaterte ikke-alvorlige hendelser ble observert, inkludert 3 rapporter om vedvarende væsning, 2 hematomer og 1 bensmerte etter trening.

Det var 3 pasienter i del 2 som ble vurdert som mislykket behandling: 2 på grunn av manglende hemostase uten bruk av kompresjon og 1 på grunn av den store vaskulære komplikasjonen (pseudoaneurisme). Det var ingen behandlingssvikt i del 1 av studien.

Av de seks enhetsfeilene i del 2 av studien forstyrret tre ikke prosedyren. Én av dem skyldtes brukerfeil, én var lekkasje i innføringenheten og én var et ødelagt filamentledd. De to siste problemene ble løst med modelloppdateringene som er implementert i C11202.

Del 2 av den kliniske studien før markedsføring rapporterte ikke resultatene av oppfølging etter 6 måneder på grunn av manglende etterlevelse hos pasienten. Resultatene av den kliniske studien før markedsføring (EU-SE-001) etter 30 dager, som er i tråd med oppfølgingsperioden i klinisk litteratur, viser at FemoSeal™ VCS er trygt og effektivt.

### 1.4.2 Oppsummering av data fra kliniske studier etter markedsføring

Det ble utført 4 fullførte kliniske studier etter markedsføring, beskrevet i **Tabell 1.6** nedenfor. Disse kliniske undersøkelsene er ikke publisert eller tilgjengelige på nettet.

**Tabell 1.6 Kliniske studier etter markedsføring**

| Fullførte kliniske studier etter markedsføring                                              |                                                              |                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                      |

| PMS FemoSeal® VCS #11202 (R1756-01) (2006) User Acceptability of New Packaging (SIS) (2006) | 2006<br>RADI                                                 | Studie etter markedsføring, brukerakseptabilitet for ny emballasje | Studie etter markedsføring utført på modelloppdateringen FemoSeal Vascular® Closure System nr. 11202 som har et modifisert leveringssystem sammenlignet med den første modellen, nr. 11200, for å dokumentere funksjonaliteten. Formålet med studien var å få tilbakemelding på den reviderte bruksanvisningen, opplæringsprosjektet for leger og sykepleiere, for å bekrefte vurderingene som er gjort i risikoanalysen og å gi innspill til eventuelle kvalitetsforbedringer av produktene. | 100 pasienter <ul style="list-style-type: none"> <li>63 menn / 37 kvinner</li> <li>Gjennomsnittsalder 68 år for kvinner, 65 år for menn</li> </ul> 2 svenske sykehus, 6 leger<br><br>112 enheter<br><br>Data registrert i pasientjournal-skjemaer (CRF)<br><br>Planlagt observasjonstid – 30 minutter fra påføringstidspunktet | Resultater<br><br>1. |--|--|--|--|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

2006-studien ble utført for å bekrefte sikkerheten og effektiviteten til den nåværende enheten med et forbedret innføringssystem og for å få tilbakemeldinger om FemoSeal™ VCS IFU og opplæringsprogrammet. Studien inkluderte 100 pasienter, og det primære slutt punktet var om hemostase ble oppnådd, eller om ytterligere manuell eller mekanisk kompresjon var nødvendig. Denne studien konkluderte med at bruk av FemoSeal™ VCS var vellykket i de fleste tilfellene (91% oppnådde umiddelbar hemostase).

Studien i 2008 inkluderte 50 pasienter for å vurdere sikkerheten og ytelsen til FemoSeal™ VCS ved bruk under normal klinisk rutine hos pasienter som fikk utført kardial kateterisering med en 7 Fr-hylse. Studiens primære slutt punkt var å samle inn data om tid til hemostase og tid til ambulerings uten ytterligere kompresjon, manuell eller mekanisk. Studieresultatene konkluderte med at gjennomsnittlig tid til hemostase var 57,8 sekunder, og at alle pasienter var ambulering etter 4 timer med hvile.

2009-studien var ment å evaluere den nye FemoSeal™ VCS-emballasjen. 25 pasienter var inkludert i studien. Det primære endepunktet var om brukeren opplevde problemer med emballasjen. Brukerne merket ingen problemer med den nye FemoSeal™ VCS-emballasjen. Denne studien samlet også inn data for tid til hemostase.

Formålet med 2022-studien var proaktiv innsamling av data om sikkerheten og effekten til FemoSeal VCS gjennom oppnådd hemostase i tilgangsstedet for hovedlårarterien hos reelle

forsøkspersoner som gjennomgår perkutane endovaskulære prosedyrer. 230 pasienter var inkludert i studien. Primære endepunkter for registeret er prosedyremessig suksess (dvs. vellykket hemostase på punksjonsstedet) og reduksjon i alvorlige komplikasjoner (f.eks. vaskulær skade, blødning relatert til tilgangsstedet, infeksjon på tilgangsstedet, gjentatt manuell kompresjon og ny tilgangsstedrelatert ipsilateral akutt iskemi i bena). Studien konkluderte med at FemoSeal™ VCS fungerer godt i reelle omgivelser og gir effektiv hemostase og lav forekomst av komplikasjoner på tilgangsstedet for pasienter som gjennomgår perifere endovaskulære intervensjoner. Det viser god ytelse med kort tid til hemostase og god brukertilbakemelding, noe som gjør FemoSeal™ VCS til en verdifull enhet for lukking av femoral tilgang.

### 1.4.3 Oppsummering av data fra klinisk oppfølging etter markedsføring

#### 1.4.3.1 Fullførte kliniske studier etter markedsføring

Et sammendrag av de fullførte kliniske oppfølgingsaktivitetene etter markedsføring er beskrevet i **tabell 1.7** nedenfor.

**Tabell 1.7. Kliniske oppfølgingsaktiviteter etter markedsføring**

Terumo Medical Corporation har fullført tre brukerundersøkelser av høy kvalitet blant leger i løpet av gjeldende rapporteringsperiode (01. september 2019-31. august 2024).

Kliniske undersøkelser om FemoSeal™ samlet proaktive kliniske data i forbindelse med sikkerheten og ytelsen til FemoSeal™ VCS under klinisk bruk. Undersøkelsen omfattet spørsmål med fokus på enheten generelt og tilknyttet tilbehør, inkludert guidewiren på 0,038 tommer og den direkte interaksjonen mellom dem. De kliniske undersøkelsene av guidewiren samlet inn proaktive kliniske data i forbindelse med sikkerhet og ytelse under klinisk bruk av guidewiren på 0,038 tommer som leveres med FemoSeal™ VCS. Spørsmålene i undersøkelsen fokuserte spesifikt på generell bruk av guidewiren, fra innføring gjennom prosedyrehylsen inn i vaskulaturen til og med fjerning av wiren.

FemoSeal™ VCS og guidewiren på 0.038" som fulgte med utstyret, fikk akseptable vurderinger, og det ble registrert seks (6) klager på enheten og ni (9) anmerkninger for guidewiren basert på evaluering av kommentarene fra de kliniske kvalitetsundersøkelsene. Reklamasjonene er evaluert for både FemoSeal og guidewiren, og ble vurdert som en del av Terumos overvåkingsprosjekt etter markedsføring. Ingen nye risikoer og/eller risikonivåer ble identifisert.

En brukerundersøkelse blant leger ble gjennomført i 2024 som en del av PMCF-aktivitetene. Resultatene av undersøkelsen viste at ytelsesvurderingen og sikkerheten til FemoSeal™ VCS generelt var svært gunstig. Kompatibiliteten til andre guidewirer enn den som følger med FemoSeal™ VCS som standard, ble også vist.

#### **1.4.3.2 Løpende/planlagt klinisk oppfølging etter markeds lansering**

TMC har én pågående/planlagt klinisk oppfølgingsaktivitet etter markedsføring. Det vil bli utført en klinisk undersøkelse for å innhente tilbakemeldinger relatert til bruk av guidewiren med FemoSeal VCS distribuert på EU-markedet. Undersøkelsen vil bli besvart av leger for å studere hvilke guidewirer de brukte under prosedyren. Hensikten med denne undersøkelsen er å adressere et gap identifisert som mangel på litteratur og kommentarer fra eksterne granskere om hvor kompatibel FemoSeal™ VCS er med bruk av andre guidewirer fra andre merker enn Terumo. Tilbakemeldingen omfatter tekniske resultater, klinisk ytelse og sikkerhet knyttet til utstyrets ytelse med ulike guidewirer.

#### **1.4.4 Sammendrag av data fra systematisk litteraturgjennomgang**

Terumo Medical Corporation gjennomfører systematiske litteraturgjennomganger for å samle inn og evaluere kliniske sikkerhets- og ytelsesdata fra publiserte studier om FemoSeal™ VCS og/eller lignende utstyr. Målet med den årlige screeningen av publisert litteratur er å identifisere tidligere ukjente bivirkninger, overvåke kjente bivirkninger, identifisere oppståtte risikoer og identifisere mulig systematisk feilbruk eller ikke-godkjent bruk av FemoSeal™ VCS.

Den siste systematiske litteraturgjennomgangen, som omfattet perioden fra 1. september 2019 til og med 31. august 2024, identifiserte 29 publiserte studier som ga data om klinisk sikkerhet og ytelse for FemoSeal™ VCS. 23 referanser rapporterte bruk av FemoSeal™ VCS i henhold til anvisningene (on-label), og bruk som ikke var i henhold til anvisningene (off-label) ble rapportert i ni studier. Litteraturgjennomgangen av studier som er spesifikke for bruk av FemoSeal™ VCS, viser samlet sett en populasjon under studie som er representativ for pasienter i EU som gjennomgår perkutane vaskulære kateteriseringsprosedyrer. Se listen over disse 23 fagfellevurderte publikasjonene i **Avsnitt 3**.

Klinisk ytelse ble vurdert ved følgende måleverdier:

- Tiden til hemostase er bedre enn eller sammenlignbar med dagens tekniske status for perkutan lukking av lårarterien.
- Tiden til ambulering er bedre enn eller sammenlignbar med dagens tekniske status for perkutan lukking av lårarterien.
- Forekomsten av postoperative komplikasjoner er sammenlignbar med eller lavere enn dagens tekniske status.

Basert på disse målingene av klinisk ytelse, viste dataene i denne litteraturgjennomgangen at FemoSeal™ VCS kan brukes til å lukke punksjon i lårarterien (arteriotomi) hos pasienter som har gjennomgått perkutan kateterisering med en kirurgisk hylse på 7°Fr eller mindre. Fullstendig hemostase ble oppnådd hos de fleste pasientene (79,65–100 %), og var forbundet med en mediantid til hemostase på 0,5 min, og mediantid til utskriving var 3 dager. Mellom 69,2-86,7 % av pasientene var i stand til å bevege seg 5 timer etter lukking, med et gjennomsnittlig postoperativ sengeleie på 349 min. Svikt i FemoSeal™ VCS ble observert i 3,68-4 % av tilfellene, og ytterligere manuell kompresjon var nødvendig i 0,9-4,4 % av prosedyrene.

Klinisk sikkerhet ble vurdert ved bivirkninger, inkludert, men ikke begrenset til:

- Blødning
- Hematom
- Pseudoaneurisme
- Blåmerke
- Arteriovenøs fistel
- Infeksjon
- Død

For hver av disse bivirkningene var forekomstraten som ble rapportert for FemoSeal™ VCS i de inkluderte studiene, mindre enn eller sammenlignbar med historisk rapporterte rater for manuell kompresjon og andre vaskulære lukkeinnetninger.

Ingen bivirkninger ble identifisert ved gjennomgang av 10 kasusrapporter, siden ingen nye, uventede, nye eller uakseptable risikoer ble identifisert.

Den generelle effektiviteten ved bruk av FemoSeal™ VCS under diagnostisk angiografi eller intervensjonelle operasjoner avhenger av flere faktorer, som kjønn, alder, pasientens anatomi, komorbiditeter, anatomisk plassering av punksjonsstedet, kirurgens erfaring, VCD-plasseringsmetode, postoperativ pleie osv. I tillegg til teknisk suksess, inkludert oppnåelse av hemostase, ga FemoSeal™ VCS kliniske fordeler med tanke på vaskulær lukking etter punktering av lårarterien, som redusert tid til hemostase, redusert tid til ambulering. Ytelsesresultatene for FemoSeal VCS™ er i samsvar med de som forventes for denne typen enhet når den brukes som tiltenkt. Noen av referansene som ble innhentet i løpet av den gjeldende søkeperioden, viste bruk av den undersøkte enheten på et annet anatomisk sted enn lårarterien og for lukking av arteriotomier > 7 Fr, noe som anses ikke å være i henhold til anvisningene (off-label).

Ingen ukjente bivirkninger, nye risikoer eller mulig systematisk feilbruk av enheten ble identifisert under gjennomgangen. Hvis FemoSeal™ VCS imidlertid brukes med forsiktighet av opplærte leger, fungerer det medisinske utstyret som et nyttig og nødvendig klinisk utstyr. Samlet sett løser målbehandlingen og dermed FemoSeal™ VCS det kliniske behovet som for tiden eksisterer ved behandling av komplikasjoner knyttet til vaskulær tilgang.

Dataene i denne litteraturgjennomgangen identifiserte samlet sett ingen tidligere ukjente ytelses- eller sikkerhetsproblemer i klinikk, eller bivirkninger som forekom ved høyere enn forventede/akseptable rater. Derfor kan det konkluderes fra denne litteraturen at FemoSeal™ VCS, når den brukes til å gi kompresjon for hemostase ved arteriotomien etter perkutan kateterisering, fortsetter å fungere som forventet og ikke er forbundet med alvorlige sikkerhetshendelser.

#### **1.4.5 Oppsummering av data fra kliniske studier etter markedsføring**

Et proaktivt PMS-system er på plass, og en gjennomgang av alle klager fullføres månedlig og i samsvar med interne produksjonsprosedyrer. Reklamasjonsdata ble analysert i tidsrommet 1. september 2019 til 31. august 2024. Totalt ble 28 rapporter om medisinsk utstyr og 476 rapporter om kundeklager sendt til produsenten. Av de 28 rapportene om medisinsk utstyr var 27 forbundet med bivirkninger og én forbundet med funksjonsfeil på enheten. Det var to dødsfall i løpet av rapporteringsperioden, men ingen av de rapporterte dødsfallene ble vurdert å være forbundet med studieenheten. Av de 476 klagenes som ble sendt til produsenten, var de vanligste årsakene til klagenes vanskeligheter ved plassering (146 forekomster, 0,0142 % forekomstrate). Hendelser med feilmodus ved uttrekking er den nest hyppigste med en frekvens på 0,0126 % (130 hendelser).

Det er solgt mer enn 1 030 136 FemoSeal™ Vascular Closure System-enheter globalt, og 827 843 i det europeiske økonomiske samarbeidsområdet. Den beregnede klagefrekvensen basert på globalt salg er 0,046 %. Den totale kundeklageraten er svært lav. Det ble ikke identifisert nye risikoer som ikke er inkludert i bruksanvisningen og risikodokumentasjonen.

Forekomsten av bivirkninger er vist i **Tabell 1.2**. Ingen nye uforutsette, nye eller uakseptable risikoer ble identifisert. Det var ingen signifikant økning i hyppighet eller alvorlighetsgrad av kjente bivirkninger.

#### 1.4.6 Generell oppsummering av klinisk ytelse og sikkerhet

FemoSeal™ VCS er indisert for bruk til lukking av punksjon i hovedlårarterien (arteriotomi) hos pasienter som har gjennomgått perkutan kateterisering med en kirurgisk hylse på 7F (2,33 mm) eller mindre. Denne kliniske evalueringen er basert på en omfattende analyse av tilgjengelige kliniske data og litteratur før og etter markedsføring som er relevante for tiltenkt bruk av FemoSeal™ VCS.

Det ble utført en omfattende gjennomgang av publisert litteratur i perioden fra 1. september 2019 til og med 31. august 2024. Evidensmaterialet inkluderte 29 studier for FemoSeal™ VCS. Evidensmaterialet i den kliniske evalueringen konkluderer med at når den aktuelle enheten brukes som indisert, er den sikker og effektiv, og alle risikoer eller uønskede bivirkninger som kan være forbundet med enheten under normale bruksforhold, utgjør akseptable risikoer når de veies opp mot fordelene for pasienten. Ytelsesresultatene for de aktuelle enhetene er i samsvar med de som forventes for denne typen enhet når den brukes som tiltenkt.

De potensielle bivirkningene som er forbundet med bruk av FemoSeal™ VCS, omfatter vanlige bivirkningene som rapporteres med alternative metoder for lukking av arteriotomi, f.eks. blødning og hematom. Totalt sett er forekomsten av bivirkninger rapportert ved bruk av FemoSeal™ VCS lik hyppigheten rapportert for manuell kompresjon og lignende vaskulære lukkeinnetninger. Spesielt for blødning og hematom er de rapporterte hyppighetene for FemoSeal™ VCS mindre enn de rapporterte hyppighetene for lignende vaskulært lukkeutstyr. Hver av de rapporterte bivirkningene fra både publisert litteratur og overvåking etter markedsføring, var tidligere identifisert (se **avsnitt 1.3**).

De eksisterende dataene vedrørende den kliniske sikkerheten og ytelsen til FemoSeal™ VCS tyder på at pasienten drar nytte av at bruken av denne vaskulære lukkeenheten oppveier mulige risikoer når den brukes i samsvar med bruksanvisningen.

Som angitt i avsnittene ovenfor, viser tilgjengelige data for FemoSeal™ VCS konsistens mellom dataene som er relatert til enheten som evalueres (f.eks. bruk av enheten, sikkerhetsresultater, klinisk ytelse og klinisk nytte), identifiserte tilsvarende enheter og data relatert til lignende enheter i henhold til den nyeste litteraturen.

Kryssanalysen av sikkerhetsdata identifiserte ingen avvik mellom:

- Data som er nevnt i den nyeste litteraturen
- Data som er spesifikke for enheten som evalueres
- Data nevnt i risikohåndteringsfilen(e)

- Data som er nevnt i merkingen og/eller bruksanvisningen (dvs. restrisikoer som overføres til brukeren er adressert).

Klinisk sikkerhet er vist ved lave forekomster av komplikasjoner identifisert i publisert, fagfellekvurdert klinisk litteratur, selskapssponsede kliniske studier, gjennomgang av data etter markedsføring kombinert med ingen tilbaketrekninger fra markedet. Det er ikke identifisert noen bekymringer med tanke på ytelse. Litteraturen som ble gjennomgått, inneholdt bruk av FemoSeal™ VCS som var i samsvar med produsentens tiltenkte bruk.

### 1.5 Mulige diagnostiske eller terapeutiske alternativer

Manuell kompresjon brukes tradisjonelt til å oppnå hemostase på arteriotomistedet etter vaskulær kateterisering. Manuell kompresjon har vært forbundet med langvarig immobilisering av pasienten (opptil 8 timer etter en prosedyre), samt med betydelig ubehag og lengre sykehusopphold. En nylig systematisk gjennomgang fant at mediantid til hemostase med manuell kompresjon var 20,8 minutter.<sup>1</sup>

Alternativer til manuell kompresjon omfatter eksterne hemostatisk enheter som påfører mekanisk kompresjon på arteriotomistedet. Disse enhetene reduserer ikke tiden til hemostase eller tiden til ambulerende, men reduserer personalbehovet ved å erstatte manuell kompresjon med mekanisk kompresjon. Bivirkningshyppighet forbundet med bruk av mekanisk kompresjon ligner hyppigheten ved manuell kompresjon.

Vaskulært lukkeutstyr, som FemoSeal™ VCS, er designet for å lukke arteriotomien. Formålet med utstyret er å redusere tiden til hemostase og muliggjøre tidligere ambulerende. En nylig systematisk gjennomgang, inkludert 13 kommersielt tilgjengelige enheter, fant at mediantid til oppnå hemostase med et vaskulært lukkesystem var 5,4 minutter. Mediantid til hemostase for de individuelle vaskulære lukkeenhetene var fra 1 minutt (FemoSeal™ VCS) til 14 minutter, og var mellom 4 og 10 minutter for flertallet av enhetene.<sup>1</sup>

Vanlig rapporterte bivirkninger forbundet med lukking av arteriotomistedet med manuelle kompresjoner, eksternt hemostatisk utstyr eller vaskulært lukkeutstyr inkluderer hematom, blødning på tilgangsstedet, pseudoaneurisme, arteriovenøs fistel og infeksjon. Den samme systematiske gjennomgangen (34 randomiserte kontrollerte studier, 14 401 pasienter) fant at bivirkningsratene var lignende mellom manuell kompresjon og bruk av vaskulære lukkeanordninger, med unntak av at blødningene hadde en tendens til å være litt høyere med vaskulære lukkeanordninger.<sup>1</sup>

## 1.6 Foreslått brukerprofil og opplæring

Tiltenkte brukere av FemoSeal™ Vascular Closure System er leger med opplæring som kvalifiserer dem til å utføre arteriell tilgang og lukking for endovaskulære prosedyrer gjennom hovedlårarterien, og som har deltatt i et legeinstruksjonsprogram for Terumo Medical Corporation FemoSeal™.

## 1.7 Relevante harmoniserte og felles standarder

Niniejsze podsumowanie bezpieczeństwa i działania klinicznego (SSCP) ma na celu zapewnienie publicznego dostępu do aktualnego podsumowania głównych aspektów bezpieczeństwa i działania klinicznego wyrobu FemoSeal™ Vascular Closure System (VCS).

Poniżej w **części 1.0** znajduje się podsumowanie bezpieczeństwa i działania klinicznego wyrobu, przeznaczone dla użytkowników / pracowników ochrony zdrowia.

## **1.0 PODSUMOWANIE DLA UŻYTKOWNIKÓW / PRACOWNIKÓW OCHRONY ZDROWIA**

SSCP nie ma na celu zastąpienia instrukcji obsługi, która jest głównym dokumentem zapewniającym bezpieczne użytkowanie wyrobu, i nie zawiera porad diagnostycznych ani terapeutycznych dla przewidzianych użytkowników ani pacjentów. SSCP nie ma na celu zastąpienia obowiązkowych informacji na kartach implantu ani w innych obowiązkowych dokumentach.

### **1.1 Przeznaczenie wyrobu**

#### **1.1.1 Przeznaczenie**

FemoSeal™ Vascular Closure System jest wyrobem medycznym przeznaczonym do zamykania nakłucia tętniczego po przezskórnym cewnikowaniu przez tętnicę udową wspólną.

#### **1.1.2 Zastosowanie**

FemoSeal™ Vascular Closure System służy do zamykania nakłucia (arteriotomii) tętnicy udowej wspólnej u pacjentów, u których wykonano cewnikowanie przezskórne przy użyciu koszulki zabiegowej o średnicy 7F (2,33 mm) lub mniejszej.

#### **1.1.3 Przeciwwskazania i/lub ograniczenia**

FemoSeal™ Vascular Closure System jest przeciwwskazany u pacjentów z arteriotomią, w której używano koszulki lub urządzenia o rozmiarze większym niż 7F (2,33 mm).

#### **1.1.4 Docelowa populacja pacjentów**

Bezpieczeństwo i skuteczność wyrobu FemoSeal™ Vascular Closure System zostały ustalone u pacjentów w wieku 18 lat i starszych, którzy przeszli cewnikowanie przezskórne przy użyciu koszulki zabiegowej w rozmiarze 7F (2,33 mm) lub mniejszym.

#### **1.1.5 Specjalne grupy pacjentów**

Bezpieczeństwo i skuteczność wyrobu FemoSeal™ Vascular Closure System nie zostały ustalone w następujących populacjach pacjentów:

- Pacjenci ze współistniejącą chorobą autoimmunologiczną.
- Pacjenci poddawani zabiegowi trombolizy.
- Pacjenci z klinicznie istotną chorobą naczyń obwodowych.
- Pacjenci z niekontrolowanym nadciśnieniem (> 220 mmHg skurczowe lub > 110 mmHg rozkurczowe).

- Pacjenci z zaburzeniami krwawienia, w tym trombocytopenią (<100 000 płytek krwi) lub anemią (Hgb < 10 mg/dl).
- Pacjenci ze światłem tętnicy udowej wspólnej węższym niż 5 mm.
- Pacjenci z zaburzeniami czynności nerek i/lub wątroby.
- Pacjenci z innymi istotnymi chorobami współistniejącymi.
- Populacja o określonym pochodzeniu rasowym i/lub etnicznym.
- Pacjenci z zawałem mięśnia sercowego w ciągu poprzednich 72 godzin.
- Pacjenci z przeszczepem naczyniowym lub stentem w miejscu nakłucia.
- Pacjenci w ciąży lub karmiący piersią.
- Pacjenci w wieku poniżej 18 lat.

### 1.1.6 Przewidziani użytkownicy

Przewidzianymi użytkownikami wyrobu FemoSeal™ Vascular Closure System są lekarze przeszkoleni w zakresie uzyskiwania dostępu tętniczego i zamykania naczyń po zabiegach wewnątrznaczyniowych wykonywanych przez tętnicę udową wspólną, którzy ukończyli szkolenie lekarzy w zakresie obsługi systemu FemoSeal™ organizowane przez Terumo Medical Corporation.

## 1.2 Opis wyrobu

### 1.2.1 Opis wyrobu

Wyrób FemoSeal™ Vascular Closure System, produkowany przez Terumo Medical Corporation (TMC), to wchłanianalne urządzenie do zamykania naczyń krwionośnych, przeznaczone do uzyskiwania hemostazy tętnicy udowej po przezskórnym cewnikowaniu przez tętnicę udową wspólną.

Elementy zamykające systemu FemoSeal™ to dwa wchłanianalne krążki polimerowe, uszczelka wewnętrzna i zewnętrzny krążek blokujący, które są połączone wchłanianym multifilamentem i w ten sposób mechanicznie uszczelniają arteriotomię (patrz **ilustracja 1.1** i **ilustracja 1.2**). Po wsunięciu przez koszulkę ze stożkową obudową zewnętrzny krążek blokujący jest wbijany w multifilament, co powoduje mechaniczne zamknięcie miejsca wkłucia między wewnętrznym i zewnętrznym krążkiem blokującym. Uszczelka wewnętrzna i zewnętrzny krążek blokujący są utrzymywane na miejscu przez tarcie na multifilamencie. Hemostazę uzyskuje się za pomocą środków mechanicznych. Elementy zamykające ulegają degradacji w wyniku hydrolizy.

Wszezpialne elementy zamykajace, uszczelka wewnetrzna i zewnetrzny krążek blokujacy ulegaja rozkladowi w ciagu osiemnastu (18) miesiecy, podczas gdy multifilament ulega rozkladowi i jest wchlaniany w procesie hydrolizy przez otaczajaca tkanke po dwuch (2) do trzech (3) latach. Zdolnosc wszezpialnych elementow zamykajacych do utrzymania ucisku na arteriotomii zostala przetestowana w czasie do osmiu (8) godzin. Produkty rozkladu sa metabolizowane i wydane w moczu lub wydychane jako dwutlenek wegla przez pluca. W badaniach na zwierzetach nie zaobserwowano zjawiska akumulacji. Dodatkowe elementy systemu FemoSeal™, ktore beda mialy kontakt z zywa tkanka lub krwia podczas zabiegu, to koszulka ze stozkowa obudowa, rozszerzacz, ubijak, popychacz i przewodnik.

**Ilustracja 1.1 Uszczelka wewnetrzna i zewnetrzna tarcza ustalajaca, odpowiednio**

**Ilustracja 1.2 Uszczelka wewnetrzna i zewnetrzna tarcza ustalajaca, po wprowadzeniu**

System FemoSeal™ jest pakowany razem z rozszerzaczem i przewodnikiem o średnicy zewnętrznej 0,038" (0,97 mm), długości 27,5" (70 cm) i J-kształtnym manipulatorem, patrz **ilustracja 1.3** poniżej. Przewodnik znajduje się w rurce polietylenowej. Wszystkie części są zapakowane w przymocowaną papierową tacę. Opakowanie zawiera również kartę implantu dla pacjenta. Wyrób FemoSeal™ Vascular Closure System nie wymaga dodatkowych akcesoriów, aby urządzenie działać zgodnie z przeznaczeniem, i jest przeznaczony wyłącznie do stosowania z rozszerzaczem i przewodnikiem znajdującymi się w opakowaniu produktu.

\* Wszczepialna część wyrobu; wszczepialne elementy są bezpieczne w środowisku rezonansu magnetycznego

System FemoSeal™ VCS jest sterylizowany tlenkiem etylenu (EO) i jest wyrobem medycznym jednorazowego użytku. System FemoSeal™ VCS został zaprojektowany w taki sposób, że nie można go użyć ponownie.

### **Tryb pracy**

FemoSeal™ VCS wspomaga hemostazę mechaniczną, wprowadzając wszczepialne elementy zamykające wewnątrz i na zewnątrz tętnicy udowej wspólnej. Mechanizm zapobiegający krwawieniu składa się z dwóch części: uszczelki wewnętrznej, która zabezpiecza miejsce wkłucia, oraz zewnętrznego krążka blokującego, który utrzymuje uszczelkę wewnętrzną na miejscu.

### 1.2.3 Korzyści kliniczne

System FemoSeal™ VCS zapewnia następujące korzyści kliniczne w zakresie zamknięcia naczyn po nakłuciu tętnicy udowej wspólnej:

- Skrócenie czasu do hemostazy<sup>1</sup>
- Skrócenie czasu odzyskania sprawności ruchowej<sup>1</sup>

1. Cox, T., L. Blair, C. Huntington, A. Lincourt, R. Sing, i B.T. Heniford. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures*. *Surgical technology international*, 27, 32–44.

### 1.2.4 Poprzednie generacje lub warianty

- Pierwsza wersja systemu FemoSeal™ VCS (nr 11200) była sprzedawana na rynku europejskim w 2005 roku oraz przez część 2006 roku.
- Obecny system FemoSeal™ VCS (nr 11202), z ulepszonym systemem dostarczania, jest dostępny na rynku od 28 marca 2006 roku.

### 1.2.5 Akcesoria przeznaczone do użycia razem z urządzeniem

System FemoSeal™ jest pakowany razem z rozszerzaczem, przewodnikiem o średnicy zewnętrznej 0,038" (0,97 mm) i długości 27,5" (70 cm) oraz J-kształtnym manipulatorem. Prowadnik jest dodatkowym wyposażeniem systemu FemoSeal™. J-kształtny manipulator jest elementem przewodnika, podczas gdy rozszerzacz jest elementem systemu FemoSeal™. Prowadnik jest jedynym elementem dodatkowego wyposażenia. Prowadnik znajduje się w rurce polietylenowej. Wszystkie części są zapakowane w przymocowaną papierową tacę. Opakowanie zawiera również kartę implantu dla pacjenta. Wyrób FemoSeal™ Vascular Closure System nie wymaga dodatkowych akcesoriów, aby urządzenie działać zgodnie z przeznaczeniem, i jest przeznaczony wyłącznie do stosowania z rozszerzaczem i przewodnikiem znajdującymi się w opakowaniu produktu.

### 1.2.6 Inne urządzenia i produkty przeznaczone do użytku razem z urządzeniem

FemoSeal™ VCS nie wymaga dodatkowych urządzeń, aby działać zgodnie z przeznaczeniem.

## 1.3 Zagrożenia i ostrzeżenia

### 1.3.1 Ryzyko szczątkowe i niepożądane skutki

Znane lub możliwe do przewidzenia zdarzenia niepożądane, szkody i powikłania związane z użyciem systemu Angio-Seal™ VIP w wyniku ryzyka szczątkowego wymieniono w **tabeli 1.2**. Wskaźnik wystąpienia jest oparty na analizie dokumentacji ryzyka i obliczany na podstawie danych z monitoringu po wprowadzeniu na rynek od 1 września 2019 do 31 sierpnia 2024 r. Nie

ma nieznanych zagrożeń szczątkowych dla systemu FemoSeal™ VCS, a wszystkie stosowne zagrożenia zostały uwzględnione w instrukcji użytkowania i procesie zarządzania ryzykiem.

**Tabela 1.2. Zdarzenia niepożądane / Powikłania związane z FemoSeal**

| Szkoda                                             | Częstość występowania (%) | Czynniki łagodzące                                                                                                                                                                              |

### 1.3.2 Ostrzeżenia i środki ostrożności

#### Ostrzeżenia

1. Nie używać, jeśli opakowanie zostało uszkodzone lub naruszono barierę sterylną.
2. Nie używać po upływie daty ważności — elementy biodegradowalne mogą nie działać prawidłowo.
3. Nie używać, jeśli któryś element wydaje się uszkodzony lub wadliwy.
4. Użycie wyrobu FemoSeal™ Vascular Closure System tam, gdzie mogło dojść do zakażenia bakteryjnego koszulki zabiegowej lub otaczającej tkanki, może spowodować zakażenie.
5. W razie podejrzenia, że tylna ściana tętnicy została nakłuta lub wykonano więcej niż jedno nakłucie tętnicy, nie należy polegać wyłącznie na wyrobie FemoSeal™ Vascular Closure System w celu uzyskania hemostazy tętnicy. Użyć dodatkowego ucisku manualnego lub mechanicznego.
6. Jeśli miejsce wkłucia znajduje się na rozgałęzieniu tętnicy udowej lub jest położone dystalnie względem tego rozgałęzienia, nie można używać wyrobu FemoSeal™ Vascular Closure System ze względu na ryzyko nieprawidłowego umieszczenia uszczelki wewnętrznej. To zdarzenie może spowodować powikłania krwotoczne i/lub zakłócenie normalnego przepływu krwi.
7. W przypadku utrzymującego się krwawienia tętniczego z miejsca nacięcia nie należy przecinać multifilamentu do czasu uzyskania hemostazy. Jeśli nie uda się uzyskać hemostazy, przymocować multifilament sterylnym opatrunkiem rany i zastosować dodatkowy ucisk do momentu uzyskania hemostazy. W przypadku utrzymującego się krwawienia tętniczego mogą wystąpić istotne powikłania krwawienia, które będą skutkować urazem lub śmiercią pacjenta.
8. Nie używać wyrobu FemoSeal™ Vascular Closure System, jeśli miejsce wkłucia jest położone proksymalnie względem więzadła pachwinowego, ponieważ może to spowodować krwiaka w przestrzeni zaotrzewnowej.
9. Pacjenci o podwyższonym ryzyku krwawienia mogą ucierpieć z powodu utraty dużej ilości krwi i będą wymagać transfuzji.
10. Jeśli wewnętrzny krążek odłączy się, może spowodować zakrzep i/lub embolizm.

#### Środki ostrożności

1. Wyrób FemoSeal™ Vascular Closure System może być wszczepiany przez lekarzy, którzy zostali odpowiednio przeszkoleni w obsłudze urządzenia.

2. Przed wszczepieniem wyrobu FemoSeal™ Vascular Closure System należy wykonać angiogram tętnicy udowej lub nakłucie tętnicy udowej pod kontrolą ultrasonograficzną.
3. Przerwać procedurę, jeśli:
  - Światło tętnicy udowej wspólnej < 5 mm.
  - W okolicy miejsca nakłucia tętnicy udowej wspólnej występuje stenoza i/lub płytką o znacznej wielkości.
  - Nakłucie znajduje się na rozgałęzieniu tętnicy lub jest położone dystalnie względem tego rozgałęzienia.
  - W okolicy miejsca nakłucia tętnicy udowej wspólnej występują anomalne rozgałęzienia lub atypowe naczynia krwionośne.
4. Jeśli występuje krwiak, należy zachować szczególną ostrożność w celu prawidłowego wprowadzenia koszulki ze stożkową obudową do tętnicy.
5. Zastosować technikę nakłuwania jednościennej. Nie nakłuwać tylnej ścianki tętnicy.
6. Podczas użycia wyrobu FemoSeal™ Vascular Closure System zawsze przestrzegać techniki sterylnej.
7. Wyrób FemoSeal™ Vascular Closure System jest przeznaczony wyłącznie do jednorazowego użytku i nie należy go poddawać ponownej sterylizacji ani ponownie używać. System FemoSeal™ został zaprojektowany w taki sposób, że nie można go użyć ponownie.
8. Jeśli wszczepienie uszczelki wewnętrznej napotka nieoczekiwany opór, należy przerwać zabieg.
9. Aby prawidłowo założyć uszczelkę wewnętrzną, przesunąć kciuk w taki sposób, aby przycisk mógł swobodnie odskoczyć.
10. Przed wszczepieniem zewnętrznego krążka blokującego upewnić się, że koszulka ze stożkową obudową systemu FemoSeal™ znajduje się pod powierzchnią skóry. Zewnętrzny krążek blokujący może zostać przypadkowo umieszczony powyżej poziomu skóry u pacjentów z niewielką odległością między tętnicą udową a poziomem skóry.
11. W celu prawidłowego wszczepienia konieczne może być uprzednie nacięcie skóry.
12. Jeśli uszczelka wewnętrzna znajduje się wewnątrz tętnicy, ale nie jest możliwe całkowite wciśnięcie przycisku oraz wszczepienie zewnętrznego krążka blokującego, może być konieczne przeprowadzenie operacji w celu usunięcia elementów zamykających systemu FemoSeal™.

13. Jeśli w ciągu 18 miesięcy konieczne będzie nakłucie tej samej tętnicy udowej, należy je wykonać w odległości co najmniej jednego centymetra proksymalnie od poprzedniego miejsca dostępu wyrobu FemoSeal™ Vascular Closure System.
14. Poinstruować pacjenta, aby przestrzegał zaleceń lekarza dotyczących kontroli miejsca zamknięcia.
15. Poinstruować pacjenta, aby nosił kartę informacyjną dla pacjenta przez następne 18 miesięcy

### **Środki ostrożności w czasie wypisu**

Przed rozważeniem wypisu ocenić pacjenta pod kątem następujących warunków:

1. Krwawienie i/lub krwiak w miejscu zamknięcia.
2. Ból podczas chodzenia.
3. Oznaki infekcji w miejscu zamknięcia.

### **1.3.3 Działania korygujące dotyczące bezpieczeństwa**

W okresie od 1 września 2019 do 31 sierpnia 2024 doszło do jednego działania korygującego dotyczącego bezpieczeństwa stosowania systemu FemoSeal™ VCS.

W 2022 roku firma Terumo dobrowolnie wycofała system FemoSeal™ VCS z powodu skarg dotyczących nieudanych próbnych procesów i partii dla produktu FemoSeal firmy Elkton do pomiaru siły zgniatania i siły wycofywania. Z Korei Południowej wycofano łącznie 950 urządzeń.

## **1.4 Ocena kliniczna i badania kontrolne po wprowadzeniu wyrobu na rynek**

**Tabela 1.3** zawiera listę badań podstawowych, które umożliwiły wprowadzenie systemu FemoSeal™ VCS na rynek, a także badań przeprowadzonych po wprowadzeniu systemu na rynek oraz podjętych na ich podstawie działań klinicznych.

Wersja urządzenia używana w badaniu została uwzględniona w poniższej tabeli.

Pierwsza wersja systemu FemoSeal™ VCS (nr 11200) była dostępna na rynku do 2006 roku, a kolejna (nr C11202) została wprowadzona na rynek w 2006 roku i jest dostępna dotychczas.

**Tabela 1.3 Podsumowanie badań podstawowych**

#### 1.4.1 Podsumowanie danych z badań (na zwierzętach i badań klinicznych) przed wprowadzeniem wyrobu na rynek

W tabeli 1.4 poniżej opisano wszystkie badania przeprowadzone przed wprowadzeniem produktu na rynek, zarówno badania na zwierzętach, jak i kliniczne.

**Tabela 1.4 Podsumowanie badań przeprowadzonych przed wprowadzeniem na rynek**

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002</p> <p>Radi Medical System AB</p> <p>Wykonane przez Biomatech, Francja</p> | <p>Badanie na zwierzętach</p> | <p>Celem badania była ocena biokompatybilności i biofunkcjonalności biodegradowalnego implantu zaprojektowanego w celu uzyskania hemostazy w układzie naczyniowym. Przebadany wyrób był przeznaczony do wprowadzenia w miejscu nakłucia tętnicy w celu uzyskania hemostazy. Jeden krążek wszedł do otworu w tętnicy, a drugi docisnął wewnętrzny krążek po zewnętrznej stronie tętnicy. Oba krążki zostały wprowadzone przez koszulkę introducera. Krążki zostały zaprojektowane w taki sposób, aby zapobiegać krwawieniu, zrosnąć się ze ścianą naczynia, a następnie ulec całkowitemu rozkładowi i wchłonięciu. Celem badania było zebranie i przeanalizowanie danych po funkcjonalnym wszczepieniu u owiec i świń w celu oceny zdolności implantu do utrzymania funkcji fizjologicznej podczas</p> | <p>Okres wszczepienia / obserwacji wynosi 5 tygodni dla wszystkich zwierząt</p> <p>4 owce, 1 świnia</p> <p>14 elementów zamykających</p> <p>8 elementów zamykających wszczepionych w 2 owcach</p> <p>2 elementy zamykające wszczepione w 1 świnie</p> <p>W przypadku wszczepienia dwóch elementów zamykających do tej samej tętnicy udowej, zostały one wszczepione w odległości &gt; 30 mm</p> | <p>Zarejestrowano wszelkie niepożądane oznaki (stan zapalny, martwica, krwotok lub inne zmiany chorobowe) oraz powstanie cienkiej wewnętrznej warstwy tętnicy. Szczególną uwagę zwrócono na początkową integrację tkanek, zwłaszcza na enkapsulację wewnętrznego krążka.</p> <p>Makroskopowo nie zaobserwowano znaczących objawów miejscowej nietolerancji ani tworzenia się skrzepin. Obserwacja makroskopowa nie ujawniła żadnej różnicy między owcą a świnie po wszczepieniu elementów zamykających w tętnicach udowych. Makroskopowo nie zaobserwowano znaczących objawów miejscowej nietolerancji ani tworzenia się skrzepin. Obserwacja makroskopowa nie ujawniła żadnej różnicy między owcą a świnie po wszczepieniu elementów zamykających w tętnicach udowych.</p> |

|  |  |  | stosowania w układzie krążenia, określenia reakcji gospodarza oraz reakcji wyrobu (integracja fizyczna, enkapsulacja tkanki po uśmierceniu) i oceny stopnia rozkładu implantu |  | <p>Badanie histopatologiczne miejsca wszczepienia implantu u owiec nie wykazało żadnych miejscowych reakcji niepożądanych. Wewnętrzne i zewnętrzne krążki wykazują oznaki rozkładu, a w niektórych przypadkach były rozbite na mniejsze części. Krążki wewnętrzne zostały całkowicie zintegrowane z tkanką neointymalną. W przypadku świni analiza histopatologiczna wykazała nieco więcej objawów zapalnych wokół krążka wewnętrznego i zewnętrznego. U obu zwierząt, w multifilamencie wykazano nieco więcej objawów zapalnych niż w materiale krążka, co jest normalne w przypadku plecionych nici chirurgicznych ze względu na ich większą powierzchnię.</p> <p>Drożność naczyń mierzono po 5 tygodniach przy użyciu trzech różnych metod: histomorfometrycznej i histomorfometrycznej w połączeniu z pomiarem średnicy naczyń za pomocą suwmiarki i kolorowej ultrasonografii dopplerowskiej. Średnia drożność naczyń u owiec wynosiła od 60 do 80% w zależności od metody (12 obserwacji). W przypadku świń średnia drożność naczyń wynosiła od 40 do 80% (2 obserwacje).</p> |

|--|--|--|--|--|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

W ramach wstępnego planu rozwoju systemu FemoSeal™ VCS przeprowadzono 3 testy funkcjonalne na zwierzętach. W 2000 roku przed rozpoczęciem badań klinicznych przeprowadzono badanie na zwierzętach w celu oceny biofunkcjonalności systemu FemoSeal™ VCS. W tym badaniu oceniono zdolność elementów zamykających do utrzymania funkcji fizjologicznej oraz poziom ich rozkładu. Po 18 miesiącach materiał krążka wewnętrznego i zewnętrznego nie był już widoczny i został zastąpiony endoluminalną włóknistą tkanką. Podsumowując, potwierdzono zdolność elementu zamykającego systemu FemoSeal™ VCS do utrzymania funkcji fizjologicznej podczas stosowania w układzie krążenia.

W 2002 roku przeprowadzono badanie na zwierzętach w celu oceny biokompatybilności i biofunkcjonalności biodegradowalnego implantu, systemu FemoSeal™ VCS, zaprojektowanego w celu uzyskania hemostazy w układzie naczyniowym. W skrócie: degradacja implantu była prawie zakończona przed upływem 36 tygodni i nie wystąpiła żadna znacząca niepożądana reakcja tkankowa.

W kolejnym badaniu na zwierzętach przeprowadzonym w 2002 roku dokonano oceny biokompatybilności i biofunkcjonalności biodegradowalnego implantu, systemu FemoSeal™ VCS, zaprojektowanego w celu uzyskania hemostazy w układzie naczyniowym. Po 5 tygodniach enkapsulacja krążka była zakończona i zaobserwowano oznaki rozkładu zarówno krążka wewnętrznego, jak i zewnętrznego. Podsumowując, potwierdzono zdolność implantu do utrzymania funkcji fizjologicznej po zastosowaniu w układzie krążenia.

W ramach planu rozwoju klinicznego systemu FemoSeal™ VCS firma Radi Medical System AB przeprowadziła wstępne badanie kliniczne. To badanie kliniczne nie zostało opublikowane ani udostępnione w Internecie. Badanie z użyciem modelu urządzenia #11200 zostało przeprowadzone w 2002-2004 r. zgodnie z normą europejską EN 540 (Badanie kliniczne wyrobów medycznych dla ludzi) oraz zgodnie z ogólnymi uwagami ICH dotyczącymi badań klinicznych i zasadami dobrej praktyki klinicznej. Szczegóły tego badania zostały udokumentowane w raporcie EU-SE-001. Badanie kliniczne zostało udokumentowane w końcowym sprawozdaniu firmy Radi Medical Systems AB, „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After

Diagnostic/Interventional Cardiology Procedures”. Badanie kliniczne przeprowadzono na pierwszym modelu urządzenia FemoSeal™ #11200, koncentrując się na bezpieczeństwie i skuteczności wszczepialnych elementów zamykających. Jediną różnicą między pierwszym modelem #11200 a obecnym modelem C11202 jest rozmiar French, odpowiednio 6F i 7F, oraz ulepszony system podawania. Korzyści kliniczne, przeznaczenie, sposób działania oraz surowce, z których wykonane są wszczepialne elementy zamykające, wewnętrzne uszczelka i zewnętrzny krążek blokujący pozostają niezmienione.

Urządzenie przeznaczone było do stosowania u pacjentów poddawanych diagnostycznym zabiegom kardiologicznym lub interwencyjnym z wykorzystaniem tętnicy udowej jako punktu dostępu. Celem tego badania było określenie bezpieczeństwa, działania i efektywności systemu FemoSeal™ VCS. Było to prospektywne, wieloośrodkowe, jednoramienne badanie otwarte z 30-dniową obserwacją.

Głównym punktem końcowym badania w zakresie działania był czas do hemostazy zdefiniowanej jako brak aktywnego krwawienia. Głównym punktem końcowym badania w zakresie bezpieczeństwa były przypadki poważnych powikłań naczyniowych w okresie 30 dni. Poboczne punkty końcowe obejmowały czas do mobilizacji, odsetek nieskutecznych terapii, częstotliwość występowania zdarzeń niepożądanych oraz charakterystykę działania urządzenia podczas wprowadzania i wszczepiania.

Pacjentami biorącymi udział w tym badaniu byli dorośli, którzy byli w stanie udzielić świadomej zgody, z tętnem na tętnicy grzbietowej przynajmniej jednej stopy. Pacjenci zostali wykluczeni z badania, jeśli cierpieli na którąkolwiek z poniższych chorób:

- Historia chorób naczyń obwodowych
- Choroby autoimmunologiczne
- Znane zaburzenie krwawienia spowodowane ciężką anemią
- INR >1,5
- Zawał mięśnia sercowego w ciągu poprzednich 72 godzin
- Niekontrolowane nadciśnienie pomimo leczenia
- Otyłość wykluczająca dostęp techniką Seldingera
- Obecność przeszczepu naczyniowego lub stentu w miejscu arteriotomii
- Wcześniejsze nakłucie ipsilateralne w ciągu poprzednich 3 miesięcy
- Przewidywany okres życia < 6 miesięcy

Dodatkowo pacjenci zostali zbadani śródoperacyjnie i wykluczeni z badania w przypadku zaobserwowania któregoś z poniższych objawów:

- Światło tętnicy udowej wspólnej < 5 mm
- Rozgałęzienia tętnicy w odległości 2 cm proksymalnie do miejsca wkłucia

- Znaczące zwężenie w odległości 3 cm od miejsca wkłucia
- Użycie koszulki głównego introduktora >6 Fr
- Nakłucie na rozgałęzieniu tętnicy lub położone dystalnie względem tego rozgałęzienia.
- Wielokrotne nakłucie tętnicy udowej
- Znane lub podejrzewane nakłucie ściany tylnej tętnicy udowej
- Duży krwiak (2:6 cm) po zakończeniu zabiegu
- Trudność z wprowadzeniem koszulki do zabiegu z powodu krętej tkanki lub naczynia

Badanie było oparte na pojedynczym protokole i zostało przeprowadzone w dwóch częściach:

W 1. części zakwalifikowano 20 pacjentów, następnie przeprowadzono analizę bezpieczeństwa, a w 2. części zakwalifikowano kolejnych 60 pacjentów.

W 1. części średni wiek pacjentów wynosił 65,9 roku, 70,0% pacjentów stanowili mężczyźni, a 95% jednocześnie pacjentów przyjmowało leki. W 2. części badania średni wiek pacjentów wynosił 63,8 roku, 78% pacjentów stanowili mężczyźni, a 100% jednocześnie przyjmowało leki.

Pacjenci poddani zabiegowi cewnikowania serca w celach diagnostycznych (część 1 i część 2) i interwencyjnych (część 2) byli uprawnieni do udziału w badaniu. Sposób postępowania był zgodny ze standardem opieki w każdym ze szpitali uczestniczących w badaniu, a następnie zastosowano system FemoSeal™ VCS. Dane pacjenta zostały zebrane na początku procedury, w jej trakcie oraz 1 dnia i 30 dni po zabiegu. Wyniki podsumowano w **tabeli 1.5** i wskazano, że FemoSeal™ VCS jest bezpieczny i skuteczny w użyciu w tej grupie pacjentów.

**Tabela 1.5 Wyniki kliniczne badania przeprowadzonego przed wprowadzeniem na rynek**

|                                                                                                                                       | Część 1     | Część 2                  |

| Liczba pacjentów                                                                                                                      | 20          | 60                       |
| Średni czas do hemostazy                                                                                                              | 1,2 minuty  | 1,6 minuty <sup>a</sup>  |
| Średni czas do mobilizacji                                                                                                            | 72,2 minuty | 87,5 minuty <sup>b</sup> |
| Częstość występowania poważnych powikłań naczyniowych <sup>c</sup>                                                                    | 0 (0%)      | 1 (2%)                   |
| Liczba pacjentów z zdarzeniem niepożądanym                                                                                            | 5 (25%)     | 19 (32%)                 |
| Nieprowadzenie leczenia (definiowane jako poważne powikłania naczyniowe, potrzeba ucisku manualnego lub oba te problemy jednocześnie) | 0 (0%)      | 3 (5%)                   |
| Usterki urządzenia                                                                                                                    | 0 (0%)      | 6 (10%)                  |

*<sup>a</sup>Na podstawie próby 58 pacjentów, ponieważ u 2 pacjentów nie uzyskano hemostazy w czasie zabiegu z powodu wcześniejszych nakłuć ipsilateralnych. U tych pacjentów uzyskano hemostazę po 7 minutach i 37 minutach.*

*<sup>b</sup>Na podstawie próby 59 pacjentów: 1 pacjent nie został uwzględniony, ponieważ podłączono go pod respirator z powodu obrzęku płuc i nie mógł się poruszać przez ponad tydzień.*

*<sup>c</sup>Zdefiniowano jako powikłania naczyniowe wymagające transfuzji krwi lub zabiegu chirurgicznego albo miejscowe zakażenie wymagające podania antybiotyku, hospitalizacji lub przedłużenia hospitalizacji, albo opracowanie rany*

W 1. części badania nie zaobserwowano poważnych powikłań naczyniowych. W 2. części badania odnotowano 1 poważne powikłanie naczyniowe: tętniak rzekomy zgłoszony w ciągu 1 dnia po zabiegu. Zdarzenie wymagało ucisku pod kontrolą ultradźwięków oraz wstrzyknięcia trombiny do tętniaka rzekomego, co przedłużyło hospitalizację pacjenta.

Spośród 5 zdarzeń niepożądanych zgłoszonych w 1. części badania 1 było potencjalnie związane z zastosowaniem urządzenia: aktywne krwawienie w ciągu 1 dnia po zabiegu (niesklasyfikowane jako poważne). Spośród 19 działań niepożądanych zgłoszonych w 2. części badania zaobserwowano 3 zdarzenia niepożądane związane z urządzeniem (niesklasyfikowane jako poważne) w postaci krwaka, a także 6 zdarzeń potencjalnie związanych z urządzeniem (niesklasyfikowanych jako poważne): 3 zgłoszenia uporczywego wysięku, 2 krwaki i 1 ból nogi po ćwiczeniach.

W 2. części badania leczenie 3 pacjentów uznano za nieudane: w 2 przypadkach w związku z nieosiągnięciem hemostazy bez zastosowania ucisku, a w 1 w związku z poważnym powikłaniem naczyniowym (tętniak rzekomy). W 1. części badania nie stwierdzono przypadków nieudanego leczenia.

Spośród sześciu przypadków wadliwego działania urządzenia w 2. części badania trzy nie zakłóciły zabiegu, jeden został spowodowany błędem użytkownika, jeden poległ na nieszczelności introducera, a jeden na pękniętym mocowaniu filamentu. Ostatnie dwa problemy zostały rozwiązane poprzez aktualizację modelu wprowadzoną w C11202.

2. części badania klinicznego przeprowadzonego przed wprowadzeniem urządzenia na rynek nie uwzględniono 6-miesięcznych wyników badań kontrolnych z powodu nieprzestrzegania zaleceń przez pacjentów. 30-dniowe wyniki badania klinicznego przeprowadzonego przed wprowadzeniem urządzenia na rynek (EU-SE-001), zgodne z okresem obserwacji stosowanym w literaturze klinicznej, wykazały, że system FemoSeal™ VCS jest bezpieczny i skuteczny.

#### **1.4.2 Podsumowanie danych z badań klinicznych po wprowadzeniu produktu na rynek**

W tabeli 1.6 poniżej opisano 4 zakończone badania kliniczne przeprowadzone po wprowadzeniu systemu na rynek. Te badania kliniczne nie zostały opublikowane ani udostępnione w Internecie.

**Tabela 1.6 Ukończone badania kliniczne przeprowadzone po wprowadzeniu systemu na rynek**

| Ukończone badania kliniczne przeprowadzone po wprowadzeniu systemu na rynek                    |                                                             |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                |    |     |          |       |          |           |    |           |           |                         |          |                    |            |                     |           |                   |         |                       |          |                                |          |                      |           |                          |           |                                   |          |                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Badanie z 2006 r. zostało przeprowadzone w celu potwierdzenia bezpieczeństwa i skuteczności obecnego urządzenia z ulepszonym systemem dostarczania oraz uzyskania informacji zwrotnej na temat instrukcji obsługi i programu szkoleniowego FemoSeal™ VCS. Badanie obejmowało 100 pacjentów, a głównym punktem końcowym było to, czy osiągnięto hemostazę, czy też potrzebny był dodatkowy ucisk manualny lub mechaniczny. Badanie wykazało, że zastosowanie systemu FemoSeal™ VCS zakończyło się powodzeniem w większości przypadków (91% osiągnęło natychmiastową hemostazę).

W badaniu przeprowadzonym w 2008 r. na próbie 50 pacjentów oceniono bezpieczeństwo i działanie systemu FemoSeal™ VCS w normalnej praktyce klinicznej u pacjentów poddanych cewnikowaniu serca za pomocą koszulki o rozmiarze 7 Fr. Głównym punktem końcowym w badaniu były zgromadzone dane dotyczące czasu do hemostazy oraz czasu do mobilizacji bez dodatkowego ucisku manualnego ani mechanicznego. Wyniki badania wykazały, że średni czas do hemostazy wynosił 57,8 sekundy, a wszyscy pacjenci odzyskali sprawność ruchową po 4 godzinach odpoczynku w łóżku.

Celem badania z 2009 roku była ocena nowego opakowania FemoSeal™ VCS. Do badania zakwalifikowano 25 pacjentów. Głównym punktem końcowym w badaniu było to, czy użytkownik doświadczył jakichkolwiek problemów z opakowaniem. Użytkownicy nie zauważyli żadnych problemów z nowym opakowaniem FemoSeal™ VCS. W tym badaniu zebrano również dane dotyczące upływu czasu do osiągnięcia hemostazy.

Celem badania z 2022 roku było proaktywne zgromadzenie danych dotyczących bezpieczeństwa i skuteczności systemu FemoSeal VCS w osiąganiu hemostazy miejsc dostępu

w tętnicy udowej wspólnej (CFA) u rzeczywistych pacjentów poddawanych przezskórnym zabiegom wewnątrznaczyniowym. Do badania zakwalifikowano 230 pacjentów. Głównymi punktami końcowym dla tego badania są: powodzenie zabiegu (tj. osiągnięcie hemostazy w miejscu wkłucia) oraz ograniczenie poważnych powikłań (np. uszkodzenie naczyń krwionośnych, krwawienie w miejscu wkłucia, powtórny ucisk manualny, nowe ostre niedokrwienie kończyny dolnej związane z miejscem dostępu). Badanie wykazało, że system FemoSeal™ VCS działa dobrze w rzeczywistych warunkach i zapewnia skuteczną hemostazę oraz niskie wskaźniki powikłań w miejscu dostępu u pacjentów poddawanych zabiegom wewnątrznaczyniowym w naczyniach obwodowych. System FemoSeal™ VCS wykazuje dobre działanie z krótkim czasem do hemostazy i dobrymi informacjami zwrotnymi od operatorów, co sprawia, że jest cennym urządzeniem do zamykania dostępu udowego.

### 1.4.3 Podsumowanie danych z kontroli klinicznych po wprowadzeniu produktu na rynek

#### 1.4.3.1 Zakończone działania kliniczne podjęte na podstawie badań, po wprowadzeniu systemu na rynek

Podsumowanie przeprowadzonych klinicznych działań kontrolnych po wprowadzeniu produktu na rynek zostało opisane w **tabeli 1.7** poniżej.

**Tabela 1.7. Działania kliniczne podjęte na podstawie badań, po wprowadzeniu systemu na rynek**

| Zakończone działania kliniczne podjęte na podstawie badań, po wprowadzeniu systemu na rynek |             |                                                                         |                                                                                                                                                                                                                |                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Firma Terumo Medical Corporation przeprowadziła trzy wysokiej jakości ankiety dla użytkowników medycznych w bieżącym okresie sprawozdawczym (od 1 września 2019 r. do 31 sierpnia 2024 r.).

Badania kliniczne FemoSeal™ zgromadziły proaktywne dane kliniczne dotyczące bezpieczeństwa i działania systemu FemoSeal™ VCS w zastosowaniach klinicznych. Badanie zawierało pytania dotyczące całego urządzenia i powiązanych z nim akcesoriów, w tym przewodnika 0,038" oraz ich bezpośrednich interakcji. Badania kliniczne dotyczące przewodnika zebrały dane kliniczne dotyczące bezpieczeństwa i działania przewodnika 0,038" dostarczonego z systemem FemoSeal™ VCS w zastosowaniach klinicznych. Pytania zawarte w ankiecie dotyczyły konkretnie ogólnego zastosowania przewodnika, począwszy od wprowadzenia przez koszulkę zabiegową do układu naczyniowego, a skończywszy na jego wysunięciu.

System FemoSeal™ VCS z dołączonym przewodnikiem 0,038" otrzymały same pozytywne oceny, a także wpłynęło 6 (sześć) reklamacji dotyczących urządzenia oraz 9 (dziewięć) zgłoszeń niereklamacyjnych dotyczących przewodnika nad podstawie ewaluacji uwag otrzymanych z wysokiej jakości ankiet klinicznych. Reklamacje zostały ocenione zarówno dla systemu

FemoSeal, jak i dla przewodnika, i rozpatrzono je w ramach procesu nadzoru po wprowadzeniu produktu na rynek. Nie zidentyfikowano nowych zagrożeń ani poziomów ryzyka.

Ankieta dla użytkowników medycznych została przeprowadzona w 2024 roku w ramach działań PMCF. Wyniki badania wykazały, że ogólna ocena skuteczności i bezpieczeństwa systemu FemoSeal™ VCS była bardzo pozytywna. Wykazano również kompatybilność przewodników innych niż standardowe przewodniki dostarczane z systemem FemoSeal™ VCS.

#### **1.4.3.2 Bieżąca/Planowana kontrola kliniczna po wprowadzeniu na rynek**

TMC ma jedno bieżące/planowane działania kontrolne po wprowadzeniu wyrobu na rynek. Zostanie przeprowadzona ankieta kliniczna mająca na celu prospektywne gromadzenie informacji zwrotnych dotyczących zastosowania przewodnika dostarczanego z systemem FemoSeal VCS na rynku UE. Ankieta jest przeznaczona dla lekarzy i ma na celu sprawdzenie, jakich przewodników używają podczas zabiegu. Celem tej ankiety jest wyeliminowanie luki zidentyfikowanej jako brak literatury i komentarzy recenzentów zewnętrznych dotyczących zgodności systemu FemoSeal™ VCS z użyciem przewodników innych marek niż Terumo. Informacje zwrotne obejmują wyniki techniczne, działanie kliniczne i bezpieczeństwo związane z działaniem urządzenia z wykorzystaniem różnych przewodników.

#### **1.4.4 Podsumowanie danych z systematycznego przeglądu literatury**

Terumo Medical Corporation systematycznie przegląda literaturę w celu gromadzenia i oceny danych dotyczących bezpieczeństwa i skuteczności z opublikowanych badań dotyczących produktu FemoSeal™ VCS i/lub podobnych urządzeń. Celem rocznego przeglądu literatury fachowej jest zidentyfikowanie wcześniej nieznanymi działań niepożądanych, monitorowanie znanych skutków ubocznych, rozpoznawanie pojawiających się zagrożeń oraz identyfikacja możliwości systematycznego niewłaściwego użycia lub zastosowania produktu FemoSeal™ VCS.

Ostatni systematyczny przegląd literatury, który obejmował okres od 1 września 2019 do 31 sierpnia 2024 pozwolił odnaleźć 29 opublikowanych badań, które dostarczyły danych na temat bezpieczeństwa i skuteczności produktu FemoSeal™ VCS. W dziewięciu badaniach zgłoszono dwadzieścia trzy przypadki prawidłowego i nieprawidłowego stosowania systemu FemoSeal™ VCS. Ogólnie rzecz biorąc, przegląd publikacji odnoszących się do badań dotyczących zastosowania systemu FemoSeal™ VCS ukazuje reprezentatywną populację pacjentów z UE poddanych zabiegowi przezskórnego cewnikowania naczyniowego. Lista 23 recenzowanych publikacji dotyczących użytku zgodnie z przeznaczeniem znajduje się w **części 3**.

Działanie kliniczne oceniono za pomocą następujących środków:

- Czas do hemostazy jest lepszy lub porównywalny ze znanymi przypadkami przezskórnego zamknięcia tętnicy udowej wspólnej.

- Czas do odzyskania sprawności ruchowej jest lepszy lub porównywalny ze znanymi przypadkami przezskórnego zamknięcia tętnicy udowej wspólnej.
- Częstość powikłań pooperacyjnych jest porównywalna lub niższa od obecnych standardów opieki.

Na podstawie tych parametrów działania klinicznego oraz danych pozyskanych z literatury klinicznej stwierdzono, że system FemoSeal™ VCS może być z powodzeniem używany do zamknięcia nakłucia tętnicy udowej (arteriotomii) u pacjentów, którzy przeszli cewnikowanie przezskórne przy użyciu koszulki zabiegowej o rozmiarze 7 Fr lub mniejszym. Całkowita hemostaza została osiągnięta u większości pacjentów (79,65–100%) i była powiązana z medianą czasu do hemostazy wynoszącą 0,5 min, czyli średnim czasem do wypisu wynoszącym 3 dni. Pomiędzy 69,2 a 86,7% pacjentów było w stanie poruszać się 5 godzin po zamknięciu rany, przy średnim pooperacyjnym spoczynku w łóżku wynoszącym 349 minut. Niepowodzenie systemu FemoSeal™ VCS zaobserwowano w 3,68–4% przypadków, a dodatkowy ucisk ręczny był wymagany dla 0,9–4,4% zabiegów.

Bezpieczeństwo kliniczne oceniono na podstawie zdarzeń niepożądanych, w tym między innymi:

- Krwawienie
- Krwiak
- Tętniak rzekomy
- Zasinienie
- Przetoka tętniczo-żylna
- Infekcja
- Zgon

Dla każdego z tych zdarzeń niepożądanych częstość występowania raportowana dla systemu FemoSeal™ VCS była mniejsza lub porównywalna z wcześniej raportowanym wskaźnikiem dla ucisku manualnego i innych urządzeń do zamykania naczyń.

Nie zidentyfikowano żadnych działań niepożądanych w analizie 10 przypadków, ponieważ nie zidentyfikowano żadnego nowego, nieprzewidzianego ani niedopuszczalnego ryzyka.

Ogólna skuteczność stosowania systemu FemoSeal™ VCS podczas angiografii diagnostycznej lub zabiegów interwencyjnych zależy od wielu czynników, takich jak płeć, wiek, anatomia pacjenta, choroby współistniejące, anatomiczne umiejscowienie miejsca wkłucia, doświadczenie chirurga, metoda rozmieszczenia VCD, opieka pooperacyjna, itp. Oprócz sukcesu technicznego, w tym osiągnięcia hemostazy, system FemoSeal™ VCS zapewniał korzyści kliniczne w odniesieniu do zamknięcia naczynia po nakłuciu tętnicy udowej, takie jak skrócenie czasu do hemostazy, skrócenie czasu do mobilizacji. Wyniki osiągnięte dla systemu FemoSeal™ VCS są

zgodne z wynikami oczekiwanymi dla tego wyrobu, używanego zgodnie z przeznaczeniem. Niektóre z referencji uzyskanych w bieżącym okresie wyszukiwania wykazały zastosowanie badanego urządzenia w lokalizacji anatomicznej innej niż tętnica udowa wspólna oraz do zamykania arteriotomii > 7 Fr, co jest uważane za niezgodne z przeznaczeniem.

Podczas przeglądu nie stwierdzono żadnych nieznanych skutków ubocznych, pojawiających się zagrożeń ani możliwego systematycznego niewłaściwego użycia urządzenia. Jeśli jednak system FemoSeal™ VCS jest używany z ostrożnością przez przeszkolonych lekarzy, wyrób medyczny działa jako użyteczny i niezbędny wyrób kliniczny. Ogólnie rzecz biorąc, terapia docelowa, a tym samym system FemoSeal™ VCS, odpowiada na obecną potrzebę kliniczną w leczeniu powikłań związanych z dostępem naczyniowym.

Ogólnie rzecz biorąc, dane zawarte w literaturze nie pozwoliły zidentyfikować żadnych, nieznanych wcześniej, problemów z działaniem ani bezpieczeństwem w warunkach klinicznych ani niekorzystnych efektów, które występowałyby z częstotliwością przekraczającą oczekiwania / dopuszczalne normy. W związku z tym na podstawie literatury można stwierdzić, że system FemoSeal™ VCS, używany do uzyskiwania hemostazy poprzez ucisk arteriotomii po cewnikowaniu przezskórnym, działa zgodnie z oczekiwaniami i nie powoduje poważnych zdarzeń niepożądanych związanych z bezpieczeństwem.

#### 1.4.5 Podsumowanie danych z badań nadzoru po wprowadzeniu produktu na rynek

Wdrożono proaktywny system PMS, a wszystkie reklamacje są weryfikowane co miesiąc, zgodnie z wewnętrznymi procedurami produkcyjnymi. Dane z reklamacji zostały przeanalizowane w okresie od 1 września 2019 r. do 31 sierpnia 2024 r. Ogólnie rzecz biorąc, do producenta dotarło 28 raportów dotyczących nadzoru nad wyrobami medycznymi (MDV) oraz 476 reklamacji konsumenckich. Spośród 28 zgłoszeń MDV, 27 było związanych ze zdarzeniami niepożądanymi, a jedno z nieprawidłowym działaniem wyrobu. W okresie sprawozdawczym wystąpiły dwa zgony, ale żaden ze zgłoszonych zgonów nie został uznany za związany z badanym wyrobem. Spośród 476 reklamacji złożonych do wytwórcy najczęstszą przyczyną reklamacji były trudności z wdrożeniem (146 przypadków, wskaźnik występowania 0,0142%). Tryb awarii zdarzeń wyciągania jest drugim najczęściej występującym z odsetkiem 0,0126% (130 zdarzeń).

Na całym świecie sprzedano ponad 1 030 136 sztuk wyrobu FemoSeal™ Vascular Closure System, z czego 827 843 w Europejskim Obszarze Gospodarczym. Obliczona częstotliwość reklamacji w oparciu o sprzedaż globalną wynosi 0,046%. Całkowity wskaźnik reklamacji konsumenckich jest bardzo niski. Nie zidentyfikowano nowych zagrożeń, które nie zostały uwzględnione w instrukcji obsługi i dokumentacji ryzyka.

Częstotliwość występowania działań niepożądanych przedstawiono w **tabeli 1.2**. W ramach reklamacji nie zidentyfikowano nowych nieprzewidzianych, przyszłych ani niedopuszczalnych zagrożeń. Nie zaobserwowano znaczącego wzrostu częstotliwości ani nasilenia znanych niepożądanych działań niepożądanych.

#### 1.4.6 Ogólne podsumowanie działania klinicznego i bezpieczeństwa

System FemoSeal™ VCS służy do zamykania nakłucia (arteriotomii) tętnicy udowej wspólnej u pacjentów, u których wykonano cewnikowanie przezskórne przy użyciu koszulki zabiegowej o średnicy 7F (2,33 mm) lub mniejszej. Ta ocena kliniczna opiera się na kompleksowej analizie danych klinicznych dostępnych przed wprowadzeniem wyrobu na rynek i po jego wprowadzeniu oraz na literaturze dotyczącej zamierzonego zastosowania wyrobu FemoSeal™ VCS.

Przeprowadzono kompleksowy przegląd opublikowanej literatury obejmujący okres od 1 września 2019 r. do 31 sierpnia 2024 r. Zbiór dowodów objął 29 badań dotyczących systemu FemoSeal™ VCS. Dowody przedstawione w ocenie klinicznej wskazują, że poddawany badaniu wyrób jest bezpieczny i skuteczny, gdy jest stosowany zgodnie z przeznaczeniem, a wszelkie zagrożenia lub niepożądane skutki uboczne, które mogą być związane z wyrobem w normalnych warunkach użytkowania, stanowią akceptowalne ryzyko w porównaniu z korzyściami, które przynoszą pacjentom. Wyniki osiągnięte dla badanych wyrobów są zgodne z wynikami oczekiwanymi dla tego typu wyrobów, używanych zgodnie z przeznaczeniem.

Potencjalne niepożądane skutki uboczne związane ze stosowaniem systemu FemoSeal™ VCS obejmują zdarzenia niepożądane najczęściej zgłaszane odnośnie do alternatywnych sposobów zamknięcia arteriotomii, np. krwawienie i krwiak. Ogólnie rzecz biorąc, częstotliwość występowania działań niepożądanych zgłaszanych w związku z użyciem systemu FemoSeal™ VCS jest podobna jak w przypadku ucisku manualnego i podobnych urządzeń do zamykania naczyń. Odnośnie do krwawienia i krwiaków liczba zgłoszeń dotyczących systemu FemoSeal™ VCS jest mniejsza niż w przypadku urządzeń do zamykania naczyń. Każde z działań niepożądanych, zgłoszonych w dostępnych publikacjach lub w ramach nadzoru po wprowadzeniu wyrobu na rynek, było znane już wcześniej (patrz **część 1.3**).

Dostępne dane dotyczące bezpieczeństwa klinicznego i działania FemoSeal VCS sugerują, że korzyści dla pacjenta wynikające z zastosowania tego urządzenia do zamykania naczyń krwionośnych przewyższają możliwe zagrożenia, gdy jest ono używane zgodnie z instrukcją użycia.

Jak wskazano w poprzednich rozdziałach, zgromadzone dane dotyczące systemu FemoSeal™ VCS potwierdzają spójność danych dotyczących ocenianego wyrobu (np. użycia wyrobu, wyników bezpieczeństwa, skuteczności klinicznej i korzyści klinicznych), zidentyfikowanych wyrobów równoważnych oraz danych dotyczących podobnych wyrobów wymienionych w podsumowaniu bieżącej wiedzy technicznej.

Analiza krzyżowa danych dotyczących bezpieczeństwa nie wykazała żadnych luk pomiędzy:

- danymi wymienionymi w podsumowaniu bieżącej wiedzy technicznej
- danymi specyficznymi dla ocenianego urządzenia
- danymi wymienionymi w plikach zarządzania ryzykiem

- danymi wymienionymi na etykiecie i/lub w instrukcji obsługi (tj. zagrożenia resztkowe, które należy przekazać użytkownikowi).

Bezpieczeństwo kliniczne zostało wykazane na podstawie niskiego wskaźnika powikłań zidentyfikowanych w opublikowanej recenzowanej literaturze klinicznej, sponsorowanych badaniach klinicznych oraz przeglądzie danych zgromadzonych po wprowadzeniu produktu na rynek — w zestawieniu z brakiem konieczności wycofania produktu z rynku. Nie stwierdzono żadnych obaw dotyczących skuteczności systemu FemoSeal™ VCS, a przegląd literatury obejmował tylko takie zastosowania, które były zgodne z przeznaczeniem określonym przez wytwórcę.

### 1.5 Możliwe alternatywy diagnostyczne lub terapeutyczne

Ucisk ręczny jest tradycyjnie stosowany w celu uzyskania hemostazy w miejscu arteriotomii po cewnikowaniu naczynia. Ucisk ręczny jest związany z unieruchomieniem pacjenta na dłuższy czas (do 8 godzin po zabiegu), a także znacznym dyskomfortem i dłuższym okresem hospitalizacji. Przeprowadzony niedawno przegląd systematyczny wykazał, że mediana czasu do osiągnięcia hemostazy metodą ucisku ręcznego wynosiła 20,8 minuty.<sup>1</sup>

Alternatywnym rozwiązaniem dla ucisku ręcznego są zewnętrzne urządzenia hemostatyczne, które stosują ucisk mechaniczny w miejscu arteriotomii. Urządzenia te nie skracają czasu do hemostazy ani czasu do mobilizacji pacjenta, ale zmniejszają obciążenie personelu poprzez zastąpienie ucisku manualnego uciskiem mechanicznym. Częstotliwość występowania zdarzeń niepożądanych związanych z zastosowaniem ucisku mechanicznego jest podobna jak w przypadku ucisku ręcznego.

Urządzenia do zamykania naczyń krwionośnych, takie jak system FemoSeal™ VCS, są przeznaczone do zamykania arteriotomii. Ich celem jest skrócenie czasu do hemostazy i umożliwienie wcześniejszej mobilizacji pacjenta. Przeprowadzony niedawno przegląd systematyczny, w którym sprawdzono 13 dostępnych na rynku urządzeń, wykazał, że mediana czasu do osiągnięcia hemostazy metodą ucisku ręcznego wynosiła 5,4 minuty. Mediana czasu do hemostazy dla poszczególnych urządzeń do zamykania naczyń wahała się od 1 minuty (FemoSeal™ VCS) do 14 minut; przy czym dla większości urządzeń wynosiła od 4 do 10 minut.<sup>1</sup>

Do często zgłaszanych zdarzeń niepożądanych związanych z zamknięciem arteriotomii metodą ucisku manualnego, przy użyciu zewnętrznych urządzeń hemostatycznych lub urządzeń do zamykania naczyń należą: krwiak, krwawienie w miejscu dostępu, tętniak rzekomy, przetoka tętniczo-żylna i infekcja. W tym samym przeglądzie systematycznym (34 randomizowane badania kontrolowane, 14 401 pacjentów) stwierdzono, że częstotliwość występowania zdarzeń niepożądanych była podobna pomiędzy uciskiem manualnym a urządzeniami do zamykania naczyń, z tym wyjątkiem, że krwawienie było nieco większe w przypadku urządzeń do zamykania naczyń.<sup>1</sup>

## 1.6 Sugerowany profil i szkolenie użytkownika

Przewidywanymi użytkownikami wyrobu FemoSeal™ Vascular Closure System są lekarze przeszkoleni w zakresie uzyskiwania dostępu tętniczego i zamykania naczyń po zabiegach wewnątrznaczyniowych wykonywanych przez tętnicę udową wspólną, którzy ukończyli szkolenie lekarzy w zakresie obsługi systemu FemoSeal™ organizowane przez Terumo Medical Corporation.

## 1.7 Odpowiednie normy zharmonizowane i wspólne

| Oznaczenie normy | Bieżący rok zgodności/wersja | Opis                                                                                                                                     |

Este Resumo do desempenho clínico e de segurança (SSCP) destina-se a fornecer acesso público a um resumo atualizado dos principais aspetos do desempenho clínico e de segurança do FemoSeal™ Vascular Closure System (VCS).

Na **Secção 1.0** é fornecido um resumo do desempenho clínico e de segurança do dispositivo, destinado a utilizadores/profissionais de saúde.

## **1.0 RESUMO PARA UTILIZADORES/PROFISSIONAIS DE SAÚDE**

O SSCP não se destina a substituir as Instruções de utilização como documento principal para garantir a utilização segura do dispositivo, nem se destina a fornecer sugestões terapêuticas ou de diagnóstico a utilizadores previstos ou pacientes. O SSCP não se destina a substituir a informação obrigatória nos cartões de implante ou em qualquer outro documento obrigatório.

### **1.1 Utilização prevista do dispositivo**

#### **1.1.1 Utilização prevista**

O FemoSeal™ Vascular Closure System é um dispositivo médico destinado à oclusão de uma punção arterial após cateterização percutânea através da artéria femoral comum.

#### **1.1.2 Indicações de utilização**

O FemoSeal™ Vascular Closure System está indicado para utilização na oclusão da punção arterial femoral comum (arteriotomia) em pacientes que tenham sido submetidos a cateterização percutânea utilizando uma bainha de procedimento de 7F (2,33 mm) ou mais pequena.

#### **1.1.3 Contraindicações e/ou limitações**

O FemoSeal™ Vascular Closure System é contraindicado para pacientes com arteriotomias nas quais tenham sido utilizados bainhas ou dispositivos superiores a 7F (2,33 mm).

#### **1.1.4 Populações de pacientes alvo**

A segurança e eficácia do FemoSeal™ Vascular Closure System foi estabelecida em pacientes com 18 anos de idade ou mais, que foram submetidos a cateterização percutânea utilizando uma bainha de procedimento de 7F (2,33 mm) ou mais pequena.

#### **1.1.5 Populações especiais de pacientes**

A segurança e eficácia do FemoSeal™ Vascular Closure System não foram estabelecidas nas seguintes populações de pacientes:

- Pacientes com doenças autoimunes pré-existentes.
- Pacientes sujeitos a trombólise terapêutica.
- Pacientes com doença vascular periférica clinicamente significativa.
- Pacientes com hipertensão não controlada (sistólica > 220 mmHg ou diastólica > 110 mmHg).
- Pacientes com distúrbios hemorrágicos, incluindo trombocitopenia (contagem de plaquetas < 100.000) ou anemia (Hgb < 10 mg/dl).

- Pacientes com um lúmen interior da artéria femoral comum inferior a 5 mm.
- Pacientes com insuficiência renal e/ou hepática.
- Pacientes com outras comorbidades relevantes.
- População com origens raciais e/ou étnicas específicas.
- Pacientes com enfarte do miocárdio no prazo de 72 horas.
- Pacientes com um enxerto vascular ou stent no local da punção.
- Pacientes grávidas ou lactantes.
- Pacientes com idade inferior a 18 anos.

### 1.1.6 Utilizadores previstos

Os utilizadores previstos do FemoSeal™ Vascular Closure System são médicos com formação que os qualifica para a realização do acesso arterial e oclusão de procedimentos endovasculares através da artéria femoral comum e que tenham participado num programa de instruções para médicos sobre o FemoSeal™ da Terumo Medical Corporation.

## 1.2 Descrição do dispositivo

### 1.2.1 Descrição do dispositivo

O FemoSeal™ Vascular Closure System, fabricado pela Terumo Medical Corporation (TMC), é um dispositivo de oclusão vascular reabsorvível concebido para alcançar a hemóstase arterial femoral após cateterização percutânea através da artéria femoral comum.

Os elementos de oclusão FemoSeal™ são compostos por dois discos de polímero reabsorvíveis, pelo vedante interno e pelo disco de bloqueio externo, que são mantidos unidos por um multifilamento reabsorvível, selando assim mecanicamente a arteriotomia (ver **Figura 1.1** e **Figura 1.2**). Depois de ter sido colocado através da bainha do invólucro do cone, o disco de bloqueio externo é comprimido na haste do multifilamento, resultando na oclusão mecânica do ponto de punção entre o disco de bloqueio interno e externo. O vedante interno e o disco de bloqueio externo são mantidos no lugar através da fricção no veio multifilamentar. A hemóstase é alcançada por meios mecânicos. Os elementos de oclusão degradam-se por hidrólise.

Os componentes de oclusão implantáveis, a vedação interna e o disco de bloqueio externo degradam-se em 18 (dezoito) meses, enquanto se estima que o multifilamento se degrade e seja absorvido por hidrólise pelo tecido circundante após 2 (dois) a 3 (três) anos. A capacidade dos componentes de oclusão implantáveis de manter a compressão na arteriotomia foi testada em até 8 (oito) horas. Os produtos de degradação são metabolizados e excretados na urina ou expirados

como dióxido de carbono através dos pulmões. Não foram observados efeitos de acumulação em estudos em animais. Os componentes adicionais do FemoSeal™ que entrarão em contacto com tecido vivo ou sangue durante o procedimento são a bainha do invólucro do cone, dilatador, tubo de manipulação, controlador de avanço e o fio-guia.

**Figura 1.1 Vedante interno e disco de bloqueio externo, respetivamente**

**Figura 1.2 Vedante interno e disco de bloqueio externo colocados**

A unidade FemoSeal™ é embalada juntamente com um dilatador, um fio-guia com um DE de 0,038" (0,97 mm) e 27,5" (70 cm) de comprimento e um esticador em J. Consulte a **Figura 1.3** abaixo. O fio-guia está contido dentro de um tubo de polietileno. Todas as peças são embaladas num tabuleiro de papel fixo. A embalagem também inclui o cartão de implante do paciente. O FemoSeal™ Vascular Closure System não requer acessórios adicionais para o dispositivo funcionar conforme previsto e o dispositivo destina-se apenas a ser utilizado com o dilatador e fio-guia incluídos na embalagem do produto.

**Figura 1.3 Unidade do FemoSeal™ VCS com o fio-guia e dilatador**

**1.2.2 Matérias-primas e componentes**

A **Tabela 1.1** abaixo lista os componentes do FemoSeal™ VCS.

**Tabela 1.1 Matérias-primas e componentes do FemoSeal™ VCS**

| Número de peça | Descrição                                                        |                                                            | Materiais                                                                                                                                                                                  |

\* Parte implantável do dispositivo; os componentes implantáveis são seguros em RM

O FemoSeal™ VCS é esterilizado por óxido de etileno (EO) e é um dispositivo médico de utilização única. O dispositivo FemoSeal™ VCS foi concebido de forma a não poder ser reutilizado.

### **Modo de atuação**

O FemoSeal™ VCS promove a hemóstase mecânica através da colocação de elementos de oclusão implantáveis dentro e fora da artéria femoral comum. O mecanismo que impede a hemorragia é fornecido pelo vedante interno que sela o local da punção e o disco de bloqueio externo que mantém o vedante interno na posição.

### 1.2.3 Benefício clínico

O FemoSeal™ VCS proporciona os seguintes benefícios clínicos em relação à oclusão vascular após punção femoral comum:

- Redução do tempo até à hemóstase<sup>1</sup>
- Redução do tempo até à deambulação<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### 1.2.4 Geração(ões) ou variantes anteriores

- A primeira versão do FemoSeal™ VCS (n.º 11200) foi vendida no mercado europeu durante o ano 2005 e parte de 2006.
- O FemoSeal™ VCS atual (n.º 11202), com um sistema de administração melhorado, está no mercado desde 28 de março de 2006.

### 1.2.5 Acessórios que se destinam a ser utilizados em combinação com o dispositivo

A unidade FemoSeal™ é embalada em conjunto com um dilatador, um fio-guia com um DE de 0.038" (0.97 mm) e 27.5" (70 cm) de comprimento e um esticador em J. O fio-guia é um acessório da unidade FemoSeal™. O esticador em J é um componente do fio-guia, enquanto o dilatador é um componente da unidade FemoSeal™. O fio-guia é o único acessório considerado. O fio-guia está contido dentro de um tubo de polietileno. Todas as peças são embaladas num tabuleiro de papel fixo. A embalagem também inclui o cartão de implante do paciente. O FemoSeal™ Vascular Closure System não requer acessórios adicionais para o dispositivo funcionar conforme previsto e o dispositivo destina-se apenas a ser utilizado com o dilatador e fio-guia incluídos na embalagem do produto.

### 1.2.6 Outros dispositivos e produtos destinados à utilização em combinação com o dispositivo

O FemoSeal™ VCS não requer dispositivos adicionais para funcionar como pretendido.

## 1.3 Riscos e avisos

### 1.3.1 Riscos residuais e efeitos indesejáveis

Os eventos adversos, lesões e complicações conhecidos ou previsíveis associados à utilização do FemoSeal™ VCS como resultado de risco residual estão listados na **Tabela 1.2**. A taxa de ocorrência baseia-se numa análise da Documentação de risco e é calculada com base em dados de Vigilância pós-comercialização de 1 de setembro de 2015 a 31 de agosto de 2024. Não

existem riscos residuais desconhecidos para o FemoSeal™ VCS e todos os riscos aplicáveis foram geridos através das Instruções de utilização e do processo de gestão de riscos.

**Tabela 1.2. Eventos adversos/complicações com o FemoSeal**

| Danos                                       | Taxa de ocorrência (%) | Fatores de mitigação                                                                                                                                                                               |

### 1.3.2 Avisos e precauções

#### Avisos

1. Não utilizar se a embalagem estiver danificada ou se qualquer barreira estéril não estiver intacta.
2. Não utilizar após o prazo de validade – os componentes biodegradáveis podem não ter um desempenho adequado.
3. Não utilizar se algum dos artigos parecer estar danificado ou defeituoso de qualquer forma.
4. A utilização do FemoSeal™ Vascular Closure System nos casos em que possa ter ocorrido a contaminação bacteriana da bainha de procedimento ou do tecido circundante, pode causar infeção.
5. Caso se suspeite que tenha ocorrido a punção da parede arterial posterior ou que tenha sido feita mais de uma punção arterial, não se deve depender apenas do FemoSeal™ Vascular Closure System para alcançar a hemóstase arterial. Utilizar compressão manual ou mecânica adicional.
6. Se o local de punção se encontrar na bifurcação da artéria femoral, ou distal à mesma, o FemoSeal™ Vascular Closure System não deve ser utilizado devido ao risco de posicionamento incorreto do vedante interno. Este evento pode resultar em complicações hemorrágicas e/ou perturbação do fluxo sanguíneo normal.
7. Se ocorrer uma hemorragia arterial persistente no local da incisão, não cortar o multifilamento até à obtenção de hemóstase. Caso não se obtenha hemóstase, fixar o multifilamento com um penso esterilizado e aplicar compressão suplementar até à obtenção de hemóstase. No caso de hemorragia arterial persistente, podem ocorrer complicações hemorrágicas significativas que podem resultar em lesões no paciente ou na morte.
8. Não utilizar o FemoSeal™ Vascular Closure System se o local de punção for proximal ao ligamento inguinal, pois tal pode resultar num hematoma retroperitoneal.
9. Os pacientes com um risco mais elevado de hemorragia podem sofrer um aumento da perda de sangue, exigindo uma transfusão.
10. Se o disco interno se soltar, pode causar um evento trombótico e/ou embólico.

#### Precauções

1. O procedimento de colocação do FemoSeal™ Vascular Closure System deve ser realizado por médicos com formação adequada na utilização do dispositivo.
2. Realizar um angiograma femoral limitado ou uma punção femoral orientada por ecografia antes da colocação do FemoSeal™ Vascular Closure System.

3. Interromper o procedimento em caso de:
  - Diâmetro do lúmen da artéria femoral comum < 5 mm.
  - Estenose e/ou presença significativa de placa próximo do local de punção femoral arterial comum.
  - A punção arterial é efetuada na bifurcação da artéria femoral, ou é distal à mesma.
  - Presença de ramificações anómalas ou anomalias dos vasos próximo do local de punção femoral comum.
4. Na presença de hematomas, deve tomar-se especial cuidado para inserir a bainha do invólucro do cone corretamente na artéria.
5. Utilizar uma técnica de punção de parede única. Não puncionar a parede posterior da artéria.
6. Seguir sempre uma técnica estéril ao utilizar o FemoSeal™ Vascular Closure System.
7. O FemoSeal™ Vascular Closure System destina-se a uma única utilização e não deve ser re-esterilizado nem reutilizado. A unidade FemoSeal™ foi concebida de forma a não poder ser reutilizada.
8. Se a colocação do vedante interno encontrar resistência inesperada, interromper o procedimento.
9. Para uma colocação correta do vedante interno, reposicionar o polegar de modo a que o botão possa voltar para trás livremente.
10. Certificar-se de que a ponta da bainha do invólucro do cone da unidade FemoSeal™ está sob a superfície da pele antes da colocação do disco de bloqueio externo. O disco de bloqueio externo pode ser colocado inadvertidamente acima do nível da pele em pacientes com uma distância curta entre a artéria femoral e o nível da pele.
11. Para uma colocação correta, pode ser necessária uma incisão cutânea antes da colocação.
12. Se o vedante interno estiver dentro da artéria, mas não for possível premir totalmente o botão e colocar o disco de bloqueio externo, poderá ser necessária uma cirurgia para remover os elementos de oclusão FemoSeal™.
13. Se for necessária a repunção da mesma artéria femoral no prazo de 18 meses, esta deve ser feita no mínimo a um centímetro proximal ao local de acesso anterior do FemoSeal™ Vascular Closure System.
14. Instruir o paciente para seguir as indicações do médico relativamente à inspeção do local de oclusão.

15. Instruir o paciente a ter consigo a Ficha de informações para o paciente durante os 18 meses seguintes

**Precauções aquando da alta**

Antes de se considerar dar alta ao paciente, avaliá-lo quanto às seguintes condições clínicas:

- 1. Hemorragia e/ou hematoma no local de oclusão.
- 2. Dor ao caminhar.
- 3. Sinais de infeção no local de oclusão.

**1.3.3 Ações corretivas de segurança no local**

Foi realizada uma Ação corretiva de segurança no local envolvendo o FemoSeal™ VCS durante o período de 1 de setembro de 2019 a 31 de agosto de 2024.

Em 2022, a Terumo retirou voluntariamente o FemoSeal™ VCS devido a reclamações alegando as falhas no processo e nos testes de lançamento de lote do produto FemoSeal fabricado pela Elkton para medição da força de compressão e força de retração. Foi recolhido um total de 950 unidades na Coreia do Sul.

**1.4 Avaliação clínica e acompanhamento clínico pós-comercialização**

A **Tabela 1.3** inclui uma lista de estudos piloto incluídos para colocar o FemoSeal™ VCS no mercado, bem como estudos pós-comercialização e atividades de acompanhamento clínico pós-comercialização. A versão do dispositivo utilizada no estudo está incluída na tabela abaixo. A primeira versão do FemoSeal™ VCS (n.º 11200) esteve no mercado até 2006, enquanto a versão seguinte (n.º C11202) foi lançada no mercado em 2006 e é a que está no mercado atualmente.

**Tabela 1.3 Resumo de estudos piloto**

#### 1.4.1 Resumo de dados de (investigações clínicas e testes em animais) pré-comercialização

A Tabela 1.4 abaixo descreve todos os estudos pré-comercialização, tanto de testes em animais como de investigações clínicas.

**Tabela 1.4 Resumos de estudos pré-comercialização**

| Testes funcionais pré-comercialização em animais                                                                              |                                |                                              |                                                                                                                                                       |                                                                                                                                                        |                                                                                                                                                                                      |

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomech, France).</p> | <p>2002</p> <p>Radi Medical System AB</p> <p>Realizado pela Biomech, França</p> | <p>Estudo em animais</p> | <p>A finalidade do estudo foi avaliar a biocompatibilidade e biofuncionalidade de um implante biodegradável concebido para alcançar a hemóstase no sistema vascular. O dispositivo testado destinava-se a entrar no orifício de punção nas artérias para alcançar a hemóstase. Um disco entrou no orifício de punção na artéria e o outro apertava o disco interno a partir do externo da artéria. Ambos os discos foram inseridos através de uma bainha introdutora. Os discos foram concebidos para evitar hemorragias, sarar para a parede do vaso e, por fim, degradar-se e ser absorvidos. O estudo foi concebido para recolher e analisar dados após a implantação funcional na ovelha e no porco para avaliar a capacidade do implante para manter a função fisiológica quando utilizado no sistema circulatório, para determinar a resposta do hospedeiro e a resposta do dispositivo (integridade física, encapsulamento tissular no sacrifício) e para avaliar a degradação do implante</p> | <p>O período/acompanhamento de implantação é de 5 semanas para todos os animais</p> <p>4 ovelhas, 1 porco</p> <p>14 elementos de oclusão</p> <p>8 elementos de oclusão implantados em 2 ovelhas,</p> <p>2 elementos de oclusão implantados em 1 porco</p> <p>Quando dois elementos de oclusão foram implantados na mesma artéria femoral, foram implantados a uma distância &gt; 30 mm</p> | <p>Foram registados todos os critérios de sinais adversos (inflamação, necrose, hemorragia ou qualquer outra lesão) ou todas as formações finas de camadas pseudo-intimais. Foi dedicada especial atenção à integração tissular inicial do dispositivo, com especial ênfase no encapsulamento do disco interno.</p> <p>Macroscopicamente, não foram observados sinais significativos de intolerância local ou formação de trombos. A observação macroscópica não revelou qualquer diferença entre o ovelha e o porco após a implantação dos elementos de oclusão nas artérias femorais.</p> <p>Macroscopicamente, não foram observados sinais significativos de intolerância local ou formação de trombos. A observação macroscópica não revelou qualquer diferença entre o ovelha e o porco após a implantação dos elementos de oclusão nas artérias femorais.</p> <p>A análise histopatológica do local de implantação nas ovelhas não demonstrou quaisquer reações adversas locais. Os discos internos e externos mostraram sinais de degradação e, em alguns</p> |

Os discos internos foram completamente integrados no tecido neointimal. No porco, a análise histopatológica mostrou sinais ligeiramente mais inflamatórios à volta dos discos internos e externos. Em ambos os animais, o multifilamento apresentava sinais ligeiramente mais inflamatórios do que no material do disco, o que é normal para suturas entrançadas devido à maior área de superfície.</p> <p>A patência do vaso foi medida ao fim de 5 semanas utilizando três métodos diferentes: histomorfométrico e histomorfométrico em combinação com a medição do diâmetro do vaso utilizando um calibrador e utilizando uma ecografia com doppler colorido. A patência média dos vasos nas ovelhas situava-se entre 60 e 80%, dependendo do método (12 observações). No porco, a patência média do vaso situava-se entre 40 e 80% (2 observações).</p> |

Como parte do plano de desenvolvimento pré-comercialização para o FemoSeal™ VCS, foram realizados três testes funcionais em animais. Em 2000, antes de iniciar estudos clínicos, foi realizado um estudo em animais para avaliar a biofuncionalidade do FemoSeal™ VCS. Este estudo avaliou a capacidade dos elementos de oclusão para manter a função fisiológica e avaliar a sua degradação. Aos 18 meses, o material do disco interno e externo já não era visível, tendo sido substituído por um tecido fibroso endoluminal. Concluindo, foi confirmada a capacidade do elemento de oclusão do FemoSeal™ VCS de manter a função fisiológica quando utilizado no sistema circulatório.

Em 2002, foi realizado um estudo em animais para avaliar a biocompatibilidade e biofuncionalidade de um implante biodegradável, o FemoSeal™ VCS, concebido para alcançar a hemóstase no sistema vascular. Em resumo, a degradação do implante estava quase concluída ao fim de 36 semanas e não houve uma reação tissular adversa significativa.

Outro estudo realizado em 2002 avaliou a biocompatibilidade e biofuncionalidade de um implante biodegradável, o FemoSeal™ VCS, concebido para alcançar a hemóstase no sistema vascular. Após 5 semanas, o encapsulamento do disco estava completo e foram observados sinais de degradação nos discos internos e externos. Concluindo, foi confirmada a capacidade do implante para manter a função fisiológica quando utilizado no sistema circulatório.

Como parte do plano de desenvolvimento clínico para o FemoSeal™ VCS, a Radi Medical System AB realizou uma investigação clínica pré-comercialização. Esta investigação clínica não foi publicada nem está disponível online. O estudo com o modelo de dispositivo n.º 11200 foi realizado em 2002-2004 ao abrigo da Norma Europeia EN 540 (Investigação Clínica de Dispositivos Médicos para Sujeitos Humanos) e em conformidade com as Considerações Gerais do ICH para Ensaio Clínicos e Diretrizes para Boas Práticas Clínicas. Os detalhes deste estudo estão documentados no relatório EU-SE-001. O ensaio clínico foi documentado no Relatório Final da Radi Medical Systems AB, "Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures". O estudo clínico foi realizado com o primeiro modelo n.º 11200 do FemoSeal e centrou-se na segurança e eficácia dos componentes de oclusão implantáveis. A única diferença entre o primeiro modelo n.º 11200 e o modelo atual, o C11202, é o tamanho francês, 6F e 7F respetivamente, e o sistema de entrega melhorado. Os benefícios clínicos, a utilização prevista, os princípios de funcionamento e as matérias-primas dos elementos de oclusão implantáveis, a vedação interna e o disco de bloqueio externo permanecem inalterados.

A utilização prevista do dispositivo era para pacientes submetidos a procedimentos de diagnóstico ou cirúrgicos cardíacos utilizando a artéria femoral como ponto de acesso. O objetivo deste estudo foi determinar a segurança, desempenho e eficácia do FemoSeal™ VCS. Este foi um estudo prospetivo, multicêntrico, aberto de segmento único com acompanhamento de 30 dias.

O parâmetro de desempenho primário foi o tempo até à hemóstase definida como a ausência de hemorragias bruscas. O parâmetro de segurança primário foi a incidência de complicações vasculares significativas ao longo de 30 dias. Os parâmetros secundários incluíram tempo até à deambulação, a proporção de insucesso no tratamento, incidência de eventos adversos e características de desempenho do dispositivo durante a administração e colocação.

Os pacientes incluídos neste estudo foram adultos capazes de dar consentimento informado e com pelo menos um pulso podal intacto. Os pacientes foram excluídos do estudo se apresentaram alguma das seguintes condições:

- Histórico de doença vascular periférica
- Doença autoimune
- Doença hemorrágica conhecida de anemia grave
- INR >1,5
- Enfarte do miocárdio com 72 horas
- Hipertensão não controlada apesar do tratamento
- Obesidade impedindo o acesso com técnica de Seldinger
- Presença de enxerto vascular ou stent no local da arteriotomia
- Punção ipsilateral anterior no prazo de 3 meses
- Esperança de vida < 6 meses

Adicionalmente, os pacientes foram examinados intraoperatoriamente e excluídos do estudo se alguma das seguintes condições foi observada:

- Diâmetro do lúmen da artéria femoral comum <5 mm
- Ramificações arteriais dentro de 2 cm proximais ao local da punção
- Estenose significativa dentro de 3 cm do local de punção
- Utilização da bainha introdutora primária >6Fr
- Punção na bifurcação femoral ou distal
- Punções femorais múltiplas
- Punção da parede femoral posterior conhecida ou suspeita
- Hematoma grande (2,6 cm) após a conclusão do procedimento
- Dificuldade na inserção da bainha primária para o procedimento devido a tecido ou vaso tortuoso

Este estudo de protocolo único foi realizado em duas partes: 20 pacientes foram inscritos durante a Parte 1, depois foi concluída uma análise de segurança, e depois foram inscritos mais 60 pacientes durante a Parte 2.

Na Parte 1, a média de idades dos pacientes inscritos era de 65,9 anos, 70,0% dos pacientes eram homens e 95% dos pacientes estavam a tomar medicação concomitante. Na Parte 2 do estudo, a média de idades era de 63,8 anos, 78% eram homens e 100% estavam a tomar medicação concomitante.

Os pacientes submetidos a procedimentos de diagnóstico (Parte 1 e Parte 2) ou cirúrgicos (Parte 2) de cateterização cardíaca foram elegíveis para inscrição no estudo. Os procedimentos estavam em conformidade com o padrão de cuidados em cada um dos hospitais inscritos, seguidos da utilização do FemoSeal™ VCS. Os dados dos pacientes foram recolhidos na linha de base, durante o procedimento e 1 dia e 30 dias após o procedimento. Os resultados estão resumidos na **Tabela 1.5** e indicam que o FemoSeal™ VCS é seguro e eficaz para utilização nesta população de pacientes.

**Tabela 1.5 Resultados clínicos comunicados no estudo pré-comercialização**

| Número de pacientes com eventos adversos                                                                                   | 5 (25%)      | 19 (32%)                  |
| Insucesso do tratamento (definido como complicações vasculares significativas, necessidade de compressão manual, ou ambas) | 0 (0%)       | 3 (5%)                    |
| Avarias do dispositivo                                                                                                     | 0 (0%)       | 6 (10%)                   |

<sup>a</sup>Com base no tamanho total da amostra de 58 porque 2 pacientes não alcançaram a hemóstase no momento do procedimento devido a punções ipsilaterais anteriores. A hemóstase foi alcançada aos 7 minutos e 37 minutos para estes pacientes.

<sup>b</sup>Com base no tamanho total da amostra de 59: 1 paciente não foi incluído porque foi colocado no ventilador devido a edema pulmonar e a deambulação não foi possível durante mais de uma semana.

<sup>c</sup>Definida como complicação vascular exigindo transfusão de sangue ou reparação cirúrgica, ou infeção local exigindo administração de antibiótico, hospitalização ou extensão de hospitalização, ou desbridamento do local

Não foram observadas complicações vasculares importantes na Parte 1 do estudo. Foi relatada uma complicação vascular significativa na Parte 2 do estudo: pseudoaneurisma que foi reportado no prazo de um dia após o procedimento. O evento exigia uma compressão orientada por ecografia e uma injeção de trombina no pseudoaneurisma e prolongou a hospitalização do paciente.

Dos cinco eventos adversos comunicados na Parte 1 do estudo, ocorreu um evento adverso possivelmente relacionado com o dispositivo: um evento não grave de hemorragia brusca no dia 1 após o procedimento. Dos 19 eventos adversos comunicados na Parte 2 do estudo, foram observados três eventos adversos não graves de hematoma relacionados com o dispositivo e foram observados seis eventos não graves possivelmente relacionados com o dispositivo, incluindo três relatórios de exsudação persistente, dois hematomas e uma dor na perna após exercício.

Houve 3 doentes na Parte 2 considerados falhas de tratamento: 2 devido à falha em alcançar a hemóstase sem a utilização de compressão e 1 devido à complicação vascular maior (pseudoaneurisma). Não houve insucessos do tratamento na Parte 1 do estudo.

Dos seis maus funcionamentos do dispositivo na Parte 2 do estudo, três não interferiram com a intervenção, um foi atribuído a erro do utilizador, um foi fuga no introdutor e um foi uma articulação de filamento quebrada. As duas últimas questões foram tratadas com atualizações de modelos implementadas no C11202.

A parte 2 do estudo clínico pré-comercialização não reportou os resultados do acompanhamento aos 6 meses devido à não conformidade dos pacientes. Os resultados de 30 dias do estudo clínico pré-comercialização (EU-SE-001), que está em linha com o período de tempo de acompanhamento da literatura clínica, demonstram que o FemoSeal™ VCS é seguro e eficaz.

#### 1.4.2 Resumo de dados de estudos clínicos pós-comercialização

Existiam 4 estudos clínicos pós-comercialização concluídos, descritos na **Tabela 1.6** abaixo. Estas investigações clínicas não estão publicadas nem estão disponíveis online.

**Tabela 1.6 Estudos clínicos pós-comercialização**

| Estudos clínicos pós-comercialização concluídos                                             |              |                                                                           |                                                                                                                                                                                                           |                                                                                                                                                                                     |                                                                                                                                              |

O estudo de 2006 foi realizado para confirmar a segurança e a eficácia do dispositivo atual com um sistema de administração melhorado e para obter feedback sobre as Instruções de Utilização e o programa de formação sobre o FemoSeal™ VCS. O estudo incluiu 100 pacientes e o parâmetro primário foi se a hemóstase foi alcançada, ou se eram necessárias compressões manuais ou mecânicas adicionais. Este estudo concluiu que a aplicação do FemoSeal™ VCS foi bem sucedida na maioria dos casos (91% alcançaram hemóstase imediata).

O estudo de 2008 inscreveu 50 pacientes para avaliar a segurança e o desempenho do FemoSeal™ VCS quando utilizado durante a rotina clínica normal em pacientes submetidos a cateterização cardíaca com uma bainha de 7 Fr. O parâmetro primário para o estudo foi recolher dados sobre o tempo até à hemóstase e o tempo até à deambulação sem compressão adicional, manual ou mecânica. Os resultados do estudo concluíram que o tempo médio até à hemóstase foi de 57.8 segundos e todos os pacientes conseguiram deambular após 4 horas de repouso na cama.

O estudo de 2009 destinou-se a avaliar a embalagem nova do FemoSeal™ VCS. Foram inscritos 25 pacientes no estudo. O parâmetro primário foi se o utilizador teve algum problema com a embalagem. Os utilizadores não notaram qualquer problema relativamente à embalagem nova do FemoSeal™ VCS. Este estudo também recolheu dados sobre o tempo até à hemóstase.

O estudo de 2022 destinava-se a recolher proativamente dados de segurança e de eficácia do FemoSeal VCS na obtenção da hemóstase de locais de acesso da artéria femoral comum (CFA) em indivíduos reais submetidos a procedimentos endovasculares percutâneos. Foram inscritos 230 pacientes no estudo. Os parâmetros primários para o registo são o sucesso do procedimento (ou seja, hemóstase do local de punção bem sucedida) e a redução de complicações graves (p. ex., lesão vascular, hemorragia relacionada com o local de acesso, infeção do local de acesso, compressão manual repetida e isquemia aguda ipsilateral da perna relacionada com o local do acesso novo). O estudo concluiu que o FemoSeal™ VCS tem um bom desempenho em ambientes reais e proporciona uma hemóstase eficaz e baixas taxas de complicações no local de acesso para pacientes submetidos a intervenções endovasculares periféricas. Demonstra um bom desempenho com um tempo curto até à hemóstase e um bom feedback de usabilidade para o operador, o que faz do FemoSeal™ VCS um dispositivo valioso para o fecho do acesso femoral.

### **1.4.3 Resumo de dados de acompanhamento clínico pós-comercialização**

#### **1.4.3.1 Acompanhamento clínico pós-comercialização concluído**

Na **Tabela 1.7** abaixo é descrito um resumo das atividades de acompanhamento clínico pós-comercialização concluídas.

**Tabela 1.7. Atividades de acompanhamento clínico pós-comercialização**

A Terumo Medical Corporation realizou três inquéritos de alta qualidade aos utilizadores médicos durante o atual período de comunicação (1 de setembro de 2019 a 31 de agosto de 2024).

Os inquéritos clínicos do FemoSeal™ recolheram dados clínicos proativos relativamente à segurança e desempenho do FemoSeal™ VCS durante a utilização clínica. O inquérito incluiu perguntas focadas no dispositivo global e acessórios associados, incluindo o fio-guia de 0.038" e as suas interações diretas. Os inquéritos clínicos sobre o fio-guia recolheram dados clínicos proativos relativos à segurança e desempenho durante a utilização clínica do fio-guia de 0.038" fornecido com o FemoSeal™ VCS. As perguntas do inquérito focaram-se especificamente na utilização geral do fio-guia, desde a inserção através da bainha de procedimento na vasculatura até à remoção do fio-guia.

O FemoSeal™ VCS e o fio-guia de 0.038" incluídos com o dispositivo receberam todas as classificações aceitáveis e foram apresentadas seis (6) reclamações para o dispositivo e nove (9) não reclamações para o fio-guia, com base na avaliação dos comentários recebidos dos inquéritos clínicos de alta qualidade. As reclamações foram avaliadas tanto para o FemoSeal como para o fio-guia e foram avaliadas como parte do processo de vigilância pós-comercialização da Terumo. Não foram identificados riscos e/ou níveis de risco novos.

Foi realizado um inquérito aos utilizadores médicos em 2024 no âmbito das atividades do PMCF. Os resultados do inquérito demonstraram que a classificação de desempenho e segurança do FemoSeal™ VCS foram, no geral, muito favoráveis. Também foi demonstrada a compatibilidade de outros fios-guia que não o padrão fornecido com o FemoSeal™ VCS.

#### **1.4.3.2 Acompanhamento clínico pós-comercialização em curso/planeado**

A TMC tem uma atividade de acompanhamento clínico pós-comercialização em curso/planeada. Será realizado um inquérito clínico para recolher de forma prospetiva feedback relacionado com a utilização do fio-guia com o FemoSeal VCS distribuído no mercado da UE. O inquérito será preenchido por médicos para apurar que fios-guia utilizaram durante o procedimento. O objetivo deste inquérito é resolver uma lacuna identificada como a falta de literatura e comentários de revisores externos sobre a compatibilidade do FemoSeal™ VCS com a utilização de outros fios-guia de marcas não Terumo. O feedback inclui resultados técnicos, desempenho clínico e segurança no que diz respeito ao desempenho do dispositivo com fios-guia diferentes.

#### **1.4.4 Resumo de dados da revisão sistemática da literatura**

A Terumo Medical Corporation realiza revisões sistemáticas da literatura para recolher e avaliar dados de segurança clínica e desempenho de estudos publicados sobre o FemoSeal™ VCS e/ou dispositivos similares. O objetivo do rastreio anual da literatura publicada é identificar efeitos secundários desconhecidos anteriormente, monitorizar efeitos secundários conhecidos, identificar riscos emergentes e identificar possível uso indevido sistemático ou utilização não conforme com o rótulo do FemoSeal™ VCS.

A mais recente revisão sistemática da literatura, que abrangeu o período de 1 de setembro de 2019 a 31 de agosto de 2024, identificou 29 estudos publicados que forneceram dados de segurança e desempenho clínico sobre o FemoSeal™ VCS. Vinte e três referências reportaram a utilização conforme com o rótulo do FemoSeal™ VCS e a utilização não conforme com o rótulo foi reportada em nove estudos. Em geral, a revisão da literatura de estudos específicos sobre o uso do FemoSeal™ VCS mostra uma população sob estudo que é representativa de pacientes na UE submetidos a procedimentos de cateterização vascular percutânea. Consulte a **Seção 3** para ver uma lista destas 23 publicações de utilizações conformes com o rótulo revistas por pares.

O desempenho clínico foi avaliado pelas seguintes medidas:

- O tempo até à hemóstase é melhor do que ou comparável com o Estado da Arte para a oclusão percutânea da artéria femoral comum.
- O tempo até à ambulância é melhor do que ou comparável com o Estado da Arte para a oclusão percutânea da artéria femoral comum.
- A taxa de complicações pós-operatórias é comparável ou inferior aos padrões atuais de cuidados.

Com base nestas medidas de desempenho clínico, os dados nesta revisão da literatura demonstraram que o FemoSeal™ VCS pode ser utilizado com sucesso na oclusão da punção arterial femoral (arteriotomia) em pacientes que foram submetidos a cateterização percutânea utilizando uma bainha de procedimento de 7 Fr ou mais pequena. A hemóstase completa foi alcançada na maioria dos pacientes (79,65-100%) dos casos e foi associada a um tempo médio até à hemóstase de 0,5 min, tempo médio até à alta de 3 dias. Entre 69,2 e 86,7% dos pacientes conseguiram deambular 5 h após a oclusão, com um repouso pós-operatório médio de 349 min. Foi observada falha do FemoSeal™ VCS em 3,68 a 4% dos casos e foi necessária compressão manual adicional em 0,9 a 4,4% dos procedimentos.

A segurança clínica foi avaliada por eventos adversos, incluindo, entre outros:

- Hemorragia
- Hematoma
- Pseudoaneurisma
- Queimadura
- Fístula arteriovenosa
- Infecção
- Morte

Para cada um destes eventos adversos, a taxa de ocorrência reportada para o FemoSeal™ VCS nos estudos incluídos foi inferior ou comparável às taxas reportadas historicamente para compressão manual e outros dispositivos de oclusão vascular.

Não foram identificados eventos adversos através da revisão de 10 relatórios de caso, uma vez que não foram identificados riscos novos, imprevistos, emergentes ou inaceitáveis.

A eficácia global da utilização do FemoSeal™ VCS durante a angiografia diagnóstica ou operações intervencionais depende de vários fatores, tais como: sexo, idade, anatomia do paciente, comorbidades, colocação anatômica do local de punção, experiência do cirurgião, método de colocação do VCD, cuidados pós-operatórios, etc. Além do sucesso técnico, incluindo a obtenção de hemóstase, o FemoSeal™ VCS ofereceu benefícios clínicos em relação à oclusão vascular após punção arterial femoral, tais como redução do tempo até à hemóstase, redução do tempo até à ambulação. Os resultados de desempenho para o FemoSeal™ VCS são consistentes com os esperados para este tipo de dispositivo quando utilizado conforme pretendido. Algumas das referências obtidas durante o período de investigação atual mostraram a utilização do dispositivo sujeito num local anatômico diferente da artéria femoral comum e para a oclusão de arteriotomias > 7 Fr, o que é considerado não conforme com o rótulo.

Não foram identificados efeitos secundários desconhecidos, riscos emergentes ou possível má utilização sistemática do dispositivo durante a revisão. No entanto, se o FemoSeal™ VCS for utilizado com cuidado por médicos com formação, o dispositivo médico funciona como um dispositivo clínico útil e necessário. Em geral, a terapia alvo e, por conseguinte, o FemoSeal™ VCS respondem à necessidade clínica que atualmente existe no tratamento de complicações relacionadas com o acesso vascular.

Em geral, os dados nesta revisão da literatura não identificaram qualquer problema de desempenho ou segurança no contexto clínico que fosse desconhecido previamente, ou efeitos adversos que tenham ocorrido a taxas superiores às previstas/aceitáveis. Por conseguinte, pode concluir-se desta revisão da literatura que o FemoSeal™ VCS, quando utilizado para fornecer compressão para hemóstase na arteriotomia após cateterização percutânea, continua a ter o desempenho esperado e não está associado a eventos de segurança graves.

#### **1.4.5 Resumo de dados de vigilância pós-comercialização**

Está em vigor um sistema PMS proativo e é realizada mensalmente uma revisão de todas as reclamações, em conformidade com os procedimentos internos de fabrico. Os dados de reclamação foram analisados durante o período de 1 de setembro de 2018 a 31 de agosto de 2024. Em geral, foram apresentados ao fabricante 28 relatórios de vigilância de dispositivos médicos (MDV) e 476 relatórios de reclamações de clientes. Dos 28 relatórios de MDV, 27 estavam relacionados com eventos adversos e um com mau funcionamento do dispositivo. Houve duas mortes durante o período de reporte, mas nenhuma das mortes reportadas foi considerada relacionada com o dispositivo do indivíduo. Entre as 476 reclamações apresentadas ao fabricante, as razões mais comuns para reclamar foram dificuldades de implementação (146

ocorrências, taxa de ocorrência de 0,0142%). O modo de falha de eventos de extração é o segundo mais frequente com uma taxa de 0,0126% (130 eventos).

O FemoSeal™ Vascular Closure System tem mais de 1.030.136 vendas a nível global e 827.843 no Espaço Económico Europeu. A frequência calculada das reclamações com base nas vendas globais é de 0,046%. A taxa global de reclamações de clientes é muito baixa. Não foram identificados riscos novos que não estejam incluídos nas Instruções de Utilização e na documentação de risco.

As taxas de ocorrência para os efeitos secundários indesejáveis são apresentadas na **Tabela 1.2**. Não foram identificados riscos não previstos, emergentes ou inaceitáveis entre as reclamações. Não houve aumentos significativos na frequência ou gravidade de efeitos secundários indesejáveis conhecidos.

#### 1.4.6 Resumo geral do desempenho clínico e segurança

O FemoSeal™ VCS é indicado para utilização no oclusão da punção arterial femoral comum (arteriotomia) em pacientes que tenham sido submetidos a cateterização percutânea utilizando uma bainha de procedimento de 7F (2,33 mm) ou mais pequena. Esta avaliação clínica baseia-se numa análise abrangente dos dados clínicos pré-comercialização e pós-comercialização disponíveis e da literatura relevante para a utilização prevista do FemoSeal™ VCS.

Foi realizada uma revisão alargada da literatura publicada que abrangeu o período de 1 de setembro de 2019 a 31 de agosto de 2024. O conjunto de evidências incluiu 29 estudos para o FemoSeal™ VCS. As evidências fornecidas na avaliação clínica concluem que, quando utilizado conforme indicado, o dispositivo em questão é seguro e eficaz e quaisquer riscos ou efeitos secundários indesejáveis, que possam estar associados ao dispositivo em condições normais de utilização, constituem riscos aceitáveis quando ponderados em relação aos benefícios para o paciente. Os resultados de desempenho para os dispositivos em questão são consistentes com os esperados para este tipo de dispositivo quando utilizado conforme pretendido.

Os efeitos secundários indesejáveis potenciais associados à utilização do FemoSeal™ VCS incluem os eventos adversos reportados habitualmente com meios alternativos de oclusão da arteriotomia, p. ex., hemorragia e hematoma. Globalmente, as taxas de ocorrência dos eventos adversos comunicados sobre a utilização do FemoSeal™ VCS são semelhantes às taxas reportadas com compressão manual e dispositivos de oclusão vascular semelhantes. Especificamente, para hemorragia e hematoma, as taxas reportadas para o FemoSeal™ VCS são inferiores às taxas reportadas para dispositivos de oclusão vascular semelhantes. Cada um dos eventos adversos comunicados, tanto da literatura publicada como da vigilância pós-comercialização, foi identificado anteriormente (ver **Secção 1.3**).

Os dados existentes relativos à segurança e desempenho clínico de FemoSeal™ VCS sugerem que os benefícios do paciente decorrentes da utilização deste dispositivo de oclusão vascular superam riscos possíveis quando é utilizado de acordo com as Instruções de Utilização.

Conforme indicado nas secções anteriores, os dados fornecidos para o FemoSeal™ VCS demonstram a coerência entre os dados relacionados com o dispositivo em análise (p. ex., utilização do dispositivo, resultados de segurança, desempenho clínico e benefícios clínicos), dispositivos equivalentes identificados e dados relacionados com dispositivos semelhantes enumerados no Estado da Arte.

A análise cruzada dos dados de segurança não identificou qualquer discrepância entre o seguinte:

- Dados mencionados no Estado da Arte
- Dados específicos do dispositivo em avaliação
- Dados mencionados no(s) Ficheiro(s) de gestão de risco
- Os dados mencionados na rotulagem e/ou nas IU (ou seja, são abordados os riscos residuais a serem transmitidos ao utilizador).

A segurança clínica foi demonstrada por taxas reduzidas de complicações identificadas na literatura clínica publicada revista por pares, estudos clínicos patrocinados pela empresa, revisão dos dados pós-comercialização associados sem retiradas de mercado. Não foi identificada nenhuma preocupação com o desempenho, a literatura revista continha a utilização do FemoSeal™ VCS que era consistente com a utilização prevista pelo fabricante.

### **1.5 Possíveis alternativas terapêuticas ou de diagnóstico**

Tradicionalmente, a compressão manual é utilizada para obter a hemóstase no local da arteriotomia após cateterizações vasculares. A compressão manual tem sido associada ao facto de o paciente estar imobilizado durante longos períodos de tempo (até 8 horas após um procedimento) e com desconforto substancial e internamentos hospitalares prolongados. Uma revisão sistemática recente concluiu que o tempo mediano até alcançar a hemóstase com compressão manual foi 20,8 minutos.<sup>1</sup>

As alternativas à compressão manual incluem dispositivos hemostáticos externos que aplicam compressão mecânica ao local da arteriotomia. Estes dispositivos não encurtam o tempo até à hemóstase ou o tempo até à deambulação, mas reduzem os requisitos do pessoal ao substituir a compressão manual por compressão mecânica. As taxas de eventos adversos associados à utilização de compressão mecânica são semelhantes às taxas da compressão manual.

Os dispositivos de oclusão vascular, como o FemoSeal™ VCS, foram concebidos para fechar a arteriotomia. O objetivo é reduzir o tempo até à hemóstase e permitir uma deambulação precoce. Uma revisão sistemática recente, incluindo 13 dispositivos disponíveis comercialmente, verificou que o tempo mediano até alcançar a hemóstase com um dispositivo de oclusão vascular

foi 5,4 minutos. O tempo mediano de hemóstase para os dispositivos de oclusão vascular individual variava entre 1 minuto (FemoSeal™ VCS) e 14 minutos; sendo a maioria dos dispositivos entre 4 e 10 minutos.<sup>1</sup>

Os eventos adversos reportados frequentemente associados à oclusão do local da arteriotomia, com compressões manuais, dispositivos hemostáticos externos ou dispositivos de oclusão vascular, incluem hematoma, hemorragia no local de acesso, pseudoaneurisma, fístula arteriovenosa e infecção. A mesma revisão sistemática (34 ensaios controlados aleatorizados, 14.401 pacientes) descobriu que as taxas de eventos adversos eram semelhantes entre a compressão manual e a utilização de dispositivos de oclusão vascular, com a exceção de que a hemorragia tendia a ser um pouco mais elevada com dispositivos de oclusão vascular.<sup>1</sup>

## 1.6 Perfil de utilizador e formação sugeridos

Os utilizadores previstos do FemoSeal™ Vascular Closure System são médicos com formação que os qualifica para a realização do acesso arterial e oclusão de procedimentos endovasculares através da artéria femoral comum e que tenham participado num programa de instruções para médicos sobre o FemoSeal™ da Terumo Medical Corporation.

## 1.7 Normas harmonizadas e comuns relevantes

Acest rezumat al caracteristicilor de siguranță și performanță clinică (SSCP) are scopul de a oferi acces public la un rezumat actualizat al principalelor aspecte de siguranță și performanță clinică ale FemoSeal™ Vascular Closure System (VCS).

Un rezumat al caracteristicilor de siguranță și performanță clinică, conceput pentru utilizatori/profesioniști în domeniul sănătății, este prezentat mai jos în **Secțiunea 1.0**.

## **1.0 REZUMAT PENTRU UTILIZATORI/PROFESIONIȘTI ÎN DOMENIUL SĂNĂTĂȚII**

SSCP nu are scopul de a înlocui Instrucțiunile de utilizare ca document principal care asigură utilizarea dispozitivului în condiții de siguranță și nici nu are scopul de a oferi sugestii de diagnosticare sau terapeutice utilizatorilor sau pacienților propuși. SSCP nu are scopul de a înlocui informațiile obligatorii de pe cardurile de implant sau din alte documente obligatorii.

### **1.1 Utilizarea preconizată a produsului**

#### **1.1.1 Utilizare preconizată**

FemoSeal™ Vascular Closure System este un dispozitiv medical destinat închiderii unei puncții arteriale după cateterizarea percutanată prin artera femurală comună.

#### **1.1.2 Instrucțiuni de utilizare**

FemoSeal™ Vascular Closure System este indicat pentru utilizare la închiderea puncției arteriale femurale comune (arteriotomie) la pacienții care au fost supuși cateterizării percutanate utilizând o teacă procedurală de 7 F (2,33 mm) sau mai mică.

#### **1.1.3 Contraindicații și/sau limitări**

FemoSeal™ Vascular Closure System este contraindicat la pacienții cu arteriotomii la care s-au utilizat teci sau dispozitive mai mari de 7 F (2,33 mm).

#### **1.1.4 Populații de pacienți țintă**

Siguranța și eficacitatea FemoSeal™ Vascular Closure System au fost stabilite la pacienții cu vârsta de cel puțin 18 ani care au fost supuși cateterizării percutanate utilizând o teacă procedurală de 7 F (2,33 mm) sau mai mică.

#### **1.1.5 Populații speciale de pacienți**

Siguranța și eficacitatea FemoSeal™ Vascular Closure System nu au fost stabilite pentru următoarele populații de pacienți:

- Pacienți cu boală autoimună preexistentă.
- Pacienți supuși unei trombolize terapeutice.
- Pacienți cu boală vasculară periferică semnificativă din punct de vedere clinic.
- Pacienți cu hipertensiune arterială necontrolată ( $> 220$  mmHg sistolică sau  $> 110$  mmHg diastolică).
- Pacienți cu tulburare hemoragică, inclusiv trombocitopenie (număr de trombocite  $< 100.000$ ) sau anemie (Hgb  $< 10$  mg/dl).

- Pacienți cu un lumen interior al arterei femurale comune mai mic de 5 mm.
- Pacienți cu insuficiență renală și/sau hepatică.
- Pacienți cu altă comorbiditate relevantă.
- Populație cu origini rasiale și/sau etnice specifice.
- Pacienți cu infarct miocardic înainte cu maximum 72 de ore.
- Pacienți cu grefă vasculară sau stent la locul puncției.
- Paciente gravide sau care alăptează.
- Pacienți cu vârsta sub 18 ani.

### 1.1.6 Utilizatorii preconizați

Utilizatorii propuși ai FemoSeal™ Vascular Closure System sunt medici cu instruire care îi califică pentru efectuarea abordului arterial și a închiderii pentru procedurile endovasculare prin artera femurală comună și care au participat la programul de instruire pentru medici al Terumo Medical Corporation FemoSeal™.

## 1.2 Descrierea dispozitivului

### 1.2.1 Descrierea dispozitivului

FemoSeal™ Vascular Closure System, fabricat de Terumo Medical Corporation (TMC), este un dispozitiv de închidere vasculară resorbabil, conceput pentru a realiza hemostaza arterială femurală după cateterizarea percutanată prin artera femurală comună.

Elementele de închidere FemoSeal™ constau din două discuri polimerice resorbabile, garnitura interioară și discul de blocare exterior, care sunt menținute împreună cu un filament multiplu resorbabil, etanșând astfel mecanic arteriotomia (consultați **Figura 1.1** și **Figura 1.2**). După ce a fost aplicat prin teaca cu carcasă conică, discul de blocare exterior este fixat pe axul filamentului multiplu, având ca rezultat închiderea mecanică a locului puncției între discul interior și discul de blocare exterior. Garnitura interioară și discul de blocare exterior sunt menținute prin frecare pe axul filamentului multiplu. Hemostaza se realizează prin mijloace mecanice. Elementele de închidere sunt degradate prin hidroliză.

Componentele de închidere implantabile, garnitura interioară și discul de blocare exterior, se degradează în optsprezece (18) luni, în timp ce filamentul multiplu este estimat a se degrada și a fi resorbit prin hidroliză de țesutul înconjurător după doi (2) până la trei (3) ani. Capacitatea componentelor de închidere implantabile de a menține compresia pe arteriotomie a fost testată la o perioadă de până la opt (8) ore. Producții de degradare sunt metabolizați și excretați în urină sau

expirați prin plămâni sub formă de dioxid de carbon. Nu au fost observate efecte de acumulare în studiile efectuate pe animale. Componentele suplimentare ale FemoSeal™ care vor intra în contact cu țesutul viu sau cu sângele în timpul procedurii sunt teaca cu carcasă conică, dilatatorul, tubul de tasare, dispozitivul de împingere și firul de ghidaj.

**Figura 1.1 Garnitură interioară și, respectiv, disc de blocare exterior**

**Figura 1.2 Garnitură interioară și disc de blocare exterior introduse**

Unitatea FemoSeal™ este ambalată împreună cu un dilatator și un fir de ghidaj cu DE de 0,038" (0,97 mm) și lungime de 27,5" (70 cm) și un dispozitiv de îndreptare în formă de J; consultați **Figura 1.3** de mai jos. Firul de ghidaj este inclus într-un tub din polietilenă. Toate piesele sunt ambalate într-o tavă de hârtie rigidă. Ambalajul include și cardul de implant al pacientului. FemoSeal™ Vascular Closure System nu necesită accesorii suplimentare pentru ca dispozitivul să funcționeze conform scopului propus, iar dispozitivul este destinat exclusiv utilizării cu dilatatorul și firul de ghidaj incluse în ambalajul produsului.

**Figura 1.3 Unitatea FemoSeal™ VCS cu fir de ghidaj și dilatator**

## 1.2.2 Materii prime și componente

Tabelul 1.1 de mai jos enumeră componentele FemoSeal™ VCS.

**Tabelul 1.1 Materii prime și componentele FemoSeal™**

| Cod | Descriere                                                                                       |                                                                | Materiale                                                                                                                                                                               |

\* Porțiune implantabilă a dispozitivului; componentele implantabile sunt sigure în mediul IRM

FemoSeal™ VCS este sterilizat cu oxid de etilenă (EO) și este un dispozitiv medical de unică folosință. Dispozitivul FemoSeal™ VCS este conceput astfel încât să nu poată fi reutilizat.

### **Mod de acțiune**

FemoSeal™ VCS susține hemostaza mecanică prin aplicarea de elemente de închidere implantabile pe interiorul și pe exteriorul arterei femurale comune. Mecanismul care împiedică sângerarea este furnizat de garnitura interioară care sigilează locul puncției și discul de blocare exterior care menține garnitura interioară în poziție.

### **1.2.3 Beneficiu clinic**

FemoSeal™ VCS oferă următoarele beneficii clinice pentru închiderea vasculară după efectuarea puncției arterei femurale comune:

- Reducerea timpului până la hemostază<sup>1</sup>
- Reducerea timpului până la mobilizarea postoperatorie<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Generație/Generații sau variante anterioare

- Prima versiune a FemoSeal™ VCS (#11200) a fost comercializată pe piața europeană în cursul anului 2005 și o parte a anului 2006.
- FemoSeal™ VCS (#11202) actual, cu un sistem de introducere îmbunătățit, se află pe piață începând cu 28 martie 2006.

#### 1.2.5 Accesorii destinate utilizării în asociere cu dispozitivul

Unitatea FemoSeal™ este ambalată împreună cu un dilatator, un fir de ghidaj cu DE de 0,038" (0,97 mm) și lungimea de 27,5" (70 cm) și un dispozitiv de îndreptare în formă de J. Firul de ghidaj este un accesoriu al unității FemoSeal™. Dispozitivul de îndreptare în formă de J este o componentă a firului de ghidaj, în timp ce dilatatorul este o componentă a unității FemoSeal™. Firul de ghidaj este singurul accesoriu luat în considerare. Firul de ghidaj este inclus într-un tub din polietilenă. Toate piesele sunt ambalate într-o tavă de hârtie rigidă. Ambalajul include și cardul de implant al pacientului. FemoSeal™ Vascular Closure System nu necesită accesorii suplimentare pentru ca dispozitivul să funcționeze conform scopului propus, iar dispozitivul este destinat exclusiv utilizării cu dilatatorul și firul de ghidaj incluse în ambalajul produsului.

#### 1.2.6 Alte dispozitive și produse destinate utilizării în asociere cu dispozitivul

FemoSeal™ VCS nu necesită dispozitive suplimentare pentru a funcționa conform scopului propus.

### 1.3 Riscuri și avertismente

#### 1.3.1 Riscuri reziduale și efecte nedorite

Evenimentele adverse, vătămrile și complicațiile cunoscute sau anticipate asociate cu utilizarea FemoSeal™ VCS ca urmare a riscurilor reziduale sunt enumerate în **Tabelul 1.2**. Frecvența evenimentelor se bazează pe o analiză a documentației de risc și se calculează pe baza datelor de supraveghere ulterioare introducerii pe piață, de la 1 septembrie 2019 până pe 31 august 2024. Nu există riscuri reziduale necunoscute pentru FemoSeal™ VCS și toate riscurile aplicabile au fost abordate prin Instrucțiunile de utilizare și procesul de gestionare a riscurilor.

**Tabelul 1.2. Evenimente adverse/complicații asociate cu FemoSeal**

| Vătămare                                              | Frecvență (%) | Factori de diminuare                                                                                                                                                                                                          |

### 1.3.2 Avertismente și precauții

#### Avertismente

1. A nu se utiliza dacă ambalajul a fost deteriorat sau dacă orice barieră sterilă nu este intactă.
2. A nu se utiliza după data de expirare – este posibil ca unele componente biodegradabile să nu mai prezinte performanța corespunzătoare.
3. A nu se utiliza dacă ambalajul pare deteriorat sau prezintă orice fel de defect.
4. Utilizarea FemoSeal™ Vascular Closure System în situațiile în care se poate să fi avut loc contaminarea bacteriană a tecii procedurale sau a țesutului înconjurător poate provoca infecții.
5. Dacă se suspectează că peretele arterial posterior a fost perforat sau s-a efectuat mai mult de o puncție arterială, nu vă bazați exclusiv pe FemoSeal™ Vascular Closure System pentru a realiza hemostaza arterială. Utilizați compresie suplimentară, manuală sau mecanică.
6. Dacă locul puncției se află în bifurcația arterei femurale sau distal față de aceasta, FemoSeal™ Vascular Closure System nu trebuie utilizat din cauza riscului ca garnitura interioară să fie poziționată incorect. Acest eveniment poate duce la complicații hemoragice și/sau la perturbarea fluxului sanguin normal.
7. Dacă există sângerări arteriale persistente la locul inciziei, nu tăiați filamentul multiplu decât după ce se realizează hemostaza. Dacă nu se realizează hemostaza, fixați filamentul multiplu cu un pansament steril și aplicați o compresie suplimentară până la realizarea hemostazei. În cazul unei hemoragii arteriale persistente pot surveni complicații hemoragice semnificative, care pot duce la vătămarea sau decesul pacientului.
8. Nu utilizați FemoSeal™ Vascular Closure System dacă locul puncției este proximal față de ligamentul inghinal, deoarece acest lucru poate avea ca rezultat un hematom retroperitoneal.
9. Pacienții care prezintă un risc crescut de sângerare pot suferi o pierdere mai mare de sânge, necesitând o transfuzie.
10. Dacă discul interior se desprinde, poate provoca un eveniment trombotic și/sau embolic.

#### Precauții

1. Procedura de introducere a FemoSeal™ Vascular Closure System trebuie efectuată de medici cu instruire adecvată în utilizarea dispozitivului.
2. Efectuați o angiogramă femurală limitată sau o puncție femurală ghidată ecografic înainte de introducerea FemoSeal™ Vascular Closure System.

3. Întrerupeți procedura dacă:
  - Diametrul lumenului arterei femurale comune < 5 mm.
  - Este prezentă stenoza și/sau depuneri semnificative în apropierea locului de puncție arterială femurală comună.
  - Puncția arterială este la bifurcația arterei femurale sau distal față de aceasta.
  - Sunt prezente ramuri anormale sau anomalii ale vaselor sanguine în apropierea locului de puncție al arterei femurale comune.
4. Dacă este prezent orice hematom, trebuie acordată o atenție suplimentară la introducerea corectă a tecii cu carcasă conică în arteră.
5. Utilizați o tehnică de puncție pe un singur perete. Nu efectuați puncția în peretele posterior al arterei.
6. Respectați întotdeauna tehnica sterilă atunci când utilizați FemoSeal™ Vascular Closure System.
7. FemoSeal™ Vascular Closure System este numai pentru unică utilizare și nu trebuie resterilizat sau reutilizat în niciun fel. Unitatea FemoSeal™ este concepută astfel încât să nu poată fi reutilizată.
8. Dacă introducerea garniturii interioare întâmpină o rezistență neașteptată, întrerupeți procedura.
9. Pentru o introducere corectă a garniturii interioare, re poziționați degetul mare astfel încât butonul să poată reveni liber.
10. Asigurați-vă că vârful tecii cu carcasă conică a unității FemoSeal™ se află sub suprafața pielii înainte de a introduce discul de blocare exterior. Discul de blocare exterior poate fi aplicat din greșeală deasupra nivelului pielii la pacienții cu o distanță scurtă între artera femurală și suprafața pielii.
11. Pentru o introducere corectă, poate fi necesară o incizie cutanată înainte de introducere.
12. Dacă garnitura interioară se află în interiorul arterei, dar nu este posibilă apăsarea completă a butonului și introducerea discului de blocare exterior, poate fi necesară intervenția chirurgicală pentru îndepărtarea elementelor de închidere FemoSeal™.
13. Dacă este necesară repetarea puncției aceleiași artere femurale în termen de 18 luni, noua puncție trebuie efectuată la cel puțin un centimetru proximal față de locul de abord anterior al FemoSeal™ Vascular Closure System.
14. Instruiți pacientul să respecte instrucțiunile medicului cu privire la inspectarea locului de închidere.
15. Instruiți pacientul să aibă asupra sa cardul cu informații pentru pacient în următoarele 18 luni

### Precauții la momentul externării

Înainte de a lua în considerare externarea, evaluați pacientul cu privire la următoarele probleme clinice:

1. Sângerare și/sau hematoame la locul de închidere.
2. Durere în timpul mersului.
3. Semne de infecție la locul de închidere.

### 1.3.3 Acțiuni corective în materie de siguranță pe teren

A existat o acțiune corectivă în materie de siguranță pe teren care a implicat FemoSeal™ VCS în perioada cuprinsă între 1 septembrie 2019 și 31 august 2024.

În 2022, Terumo a rechemat voluntar FemoSeal™ VCS din cauza reclamațiilor care invocau erorile din procesul de testare și testarea la lansarea lotului de produse FemoSeal fabricat de Elkton pentru măsurarea forței de tasare și a forței de retragere. În total au fost rechemate 950 de unități din Coreea de Sud.

## 1.4 Evaluare clinică și monitorizare clinică ulterioară introducerii pe piață

**Tabelul 1.3** include o listă a studiilor pivot incluse pentru introducerea pe piață a FemoSeal™ VCS, precum și a studiilor ulterioare introducerii pe piață și activități de monitorizare clinică ulterioare introducerii pe piață. Versiunea dispozitivului utilizat în studiu este inclusă în tabelul de mai jos. Prima versiune a FemoSeal™ VCS (#11200) a fost comercializată până în 2006, în timp ce următoarea versiune (#C11202) a fost lansată pe piață în 2006 și se află în prezent pe piață.

**Tabelul 1.3 Rezumatul studiilor pivot**

| Testarea funcțională pe animale anterior introducerii pe piață                                                                                                                                                                                                          | Versiune dispozitiv |

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002</p> <p>Radi Medical System AB</p> <p>Efectuat de Biomatech, Franța</p> | <p>Studiu pe animale</p> | <p>Scopul studiului a fost evaluarea biocompatibilității și biofuncționalității unui implant biodegradabil conceput pentru realizarea hemostazei în sistemul vascular. Dispozitivul testat a fost destinat introducerii în orificiul de puncție al arterelor pentru realizarea hemostazei. Un disc a pătruns în orificiul de puncție din arteră, iar celălalt a strâns discul interior din exteriorul arterei. Ambele discuri au fost introduse printr-o teacă a setului introdus. Discurile au fost concepute pentru a preveni sângerarea, a se vindeca în peretele vasului și, în cele din urmă, a se degrada și a fi resorbite. Studiul a fost conceput pentru a colecta și analiza date după implantarea funcțională la oi și porci pentru a evalua capacitatea implantului de a menține funcția fiziologică atunci când este utilizat în sistemul circulator, a determina răspunsul gazdei și reacția dispozitivului (integritate</p> | <p>Perioada de implantare/monitorizare este de 5 săptămâni pentru toate animalele</p> <p>4 oi, 1 porc</p> <p>14 elemente de închidere</p> <p>8 elemente de închidere implantate în 2 oi,</p> <p>2 elemente de închidere implantate în 1 porc</p> <p>Când au fost implantate două elemente de închidere în aceeași arteră femurală, acestea au fost implantate la o distanță &gt;30 mm</p> | <p>Au fost înregistrate criteriile pentru orice semne adverse (inflamație, necroză, hemoragie sau orice altă leziune) sau pentru formarea oricărui strat pseudo-intima subțire. O atenție deosebită a fost acordată integrării tisulare inițiale a dispozitivului, cu accent special pe încapsularea discului interior.</p> <p>La nivel macroscopic, nu au fost observate semne semnificative de intoleranță locală sau formare de trombi. Observarea macroscopică nu a evidențiat nicio diferență între oi sau porc după implantarea elementelor de închidere în arterele femurale. La nivel macroscopic, nu au fost observate semne semnificative de intoleranță locală sau formare de trombi. Observarea macroscopică nu a evidențiat nicio diferență între oi sau porc după implantarea elementelor de închidere în arterele femurale.</p> |

|  |  |  | fizică, încapsulare tisulară (la sacrificare) și a evalua degradarea implantului |  | <p>Analiza histopatologică a locului de implantare la oi nu a evidențiat reacții adverse locale. Discul interior și cel exterior au prezentat semne de degradare și, în unele cazuri, s-au rupt în bucăți mai mici. Discurile interioare s-au resorbit complet în țesutul neointimal. La porc, analiza histopatologică a indicat semne ușor mai puternic inflamatorii în jurul discurilor interioare și exterioare. La ambele animale, filamentul multiplu a prezentat semne ușor mai puternic inflamatorii decât materialul discului, lucru normal pentru firele de sutură împletite, din cauza întinderii mai mari a suprafeței.</p> <p>Permeabilitatea vasului sanguin a fost măsurată după 5 săptămâni utilizând trei metode diferite, histomorfometric, histomorfometric în combinație cu măsurarea diametrului vasului sanguin prin utilizarea șublerului și prin utilizarea ultrasonografiei Doppler color. Permeabilitatea medie a vasului sanguin la oi a fost între 60 și 80%, în funcție de metodă (12 observații). La porc, permeabilitatea vasului sanguin a fost între 40 și 80% (2 observații).</p> |

|--|--|--|--|--|----------------------------------------------------------------------------------------------------------------------------------------------------|

Ca parte a planului de dezvoltare anterior introducerii pe piață pentru FemoSeal™ VCS, au fost finalizate 3 teste funcționale pe animale. În 2000, înainte de inițierea studiilor clinice, s-a efectuat un studiu pe animale pentru evaluarea biofuncționalității FemoSeal™ VCS. Acest studiu a evaluat capacitatea elementelor de închidere de a menține funcția fiziologică și de a evalua degradarea acesteia. La 18 luni, materialul discului interior și exterior nu mai era vizibil, fiind înlocuit cu un țesut fibros endoluminal. În concluzie, a fost confirmată capacitatea elementului de închidere FemoSeal™ VCS de a menține funcția fiziologică atunci când este utilizat în sistemul circulator.

În 2002 s-a efectuat un studiu pe animale pentru evaluarea biocompatibilității și biofuncționalității unui implant biodegradabil FemoSeal™ VCS, conceput pentru realizarea hemostazei în sistemul vascular. Pe scurt, degradarea implantului a fost aproape completă până la 36 de săptămâni și nu a existat nicio reacție tisulară adversă semnificativă.

Un alt studiu efectuat pe animale în 2002 a evaluat biocompatibilitatea și biofuncționalitatea unui implant biodegradabil, FemoSeal™ VCS, conceput pentru a realiza hemostaza în sistemul vascular. După 5 săptămâni, încapsularea discului a fost completă și au fost observate semne de degradare la discurile interne și externe. În concluzie, a fost confirmată capacitatea implantului de a menține funcția fiziologică atunci când este utilizat în sistemul circulator.

Ca parte a planului de dezvoltare clinică pentru FemoSeal™ VCS, Radi Medical System AB a efectuat o investigație clinică anterioară introducerii pe piață. Această investigație clinică nu este publicată sau disponibilă online. Studiul pentru dispozitivul modelul # 1200 a fost efectuat în 2002-2004 în conformitate cu standardul european EN 540 (investigațiile clinice efectuate pe dispozitive medicale, pentru subiecți umani) și în conformitate cu considerentele generale ICH privind studiile clinice și ghidul privind bunele practici clinice. Detaliile acestui studiu sunt prezentate în raportul EU-SE-001. Studiul clinic a fost prezentat în raportul final al Radi Medical Systems AB, „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures”. Studiul clinic a fost efectuat cu primul model #11200 de FemoSeal™ și s-a concentrat asupra siguranței

și eficacității componentelor de închidere implantabile. Singura diferență dintre primul model #11200 și modelul actual, C11202, este dimensiunea în French, 6 F și respectiv 7 F, precum și sistemul îmbunătățit de introducere. Beneficiile clinice, utilizarea preconizată, principiile de operare și materiile prime ale elementelor de închidere implantabile, garniturii interioare și discului de blocare exterior rămân neschimbate.

Utilizarea preconizată a dispozitivului se aplica pacienților supuși procedurilor cardiologice de diagnosticare sau intervenționale, utilizând artera femurală drept punct de abord. Obiectivul acestui studiu a fost acela de a determina siguranța, performanța și eficacitatea FemoSeal™ VCS. A fost un studiu prospectiv, multicentric, cu un singur braț, deschis, cu o monitorizare de 30 de zile.

Criteriul principal de evaluare a performanței a fost timpul până la hemostază definit ca absența sângerării abundente. Criteriul principal de evaluare a siguranței a fost incidența complicațiilor vasculare majore pe parcursul a 30 de zile. Criteriile secundare de evaluare au inclus timpul până la mobilizare postoperatorie, proporția de eșecuri ale tratamentului, incidența evenimentelor adverse și caracteristicile de performanță ale dispozitivului în timpul introducerii și utilizării.

Pacienții incluși în acest studiu au fost adulți capabili să își dea consimțământul informat și cu cel puțin o pulsație periferică intactă la nivelul arterelor periferice. Pacienții au fost excluși din studiu dacă prezentau oricare dintre următoarele afecțiuni:

- Antecedent de boală vasculară periferică
- Boală autoimună
- Boală hemoragică cunoscută cu anemie severă
- INR >1,5
- Infarct miocardic în ultimele 72 de ore
- Hipertensiune necontrolată, în ciuda tratamentului
- Obezitate care împiedică abordul cu tehnica Seldinger
- Prezența grefei vasculare sau a stentului la locul arteriotomiei
- Puncție ipsilaterală anterioară în ultimele 3 luni
- Speranță de viață < 6 luni

În plus, pacienții au fost examinați intraoperatoriu și excluși din studiu dacă s-a observat oricare dintre următoarele:

- Diametrul lumenului arterei femurale comune < 5 mm
- Ramuri arteriale la 2 cm proximal față de locul puncției
- Stenoză semnificativă la 3 cm față de locul puncției

- Utilizarea tecii setului introducător principal > 6 Fr
- Puncție la bifurcația femurală sau distal față de aceasta
- Puncții femurale multiple
- Puncție cunoscută sau suspectată a peretelui femural posterior
- Hematom de dimensiuni mari (2:6 cm) la finalizarea procedurii
- Introducere dificilă a tecii primare pentru procedură, din cauza țesutului sau vasului sanguin sinuos

Acest studiu cu un singur protocol a fost efectuat în două părți: În timpul Părții 1 s-au înrolat 20 de pacienți, apoi s-a realizat o analiză privind siguranța, iar apoi s-au înrolat încă 60 de pacienți în timpul Părții 2.

În Partea 1, vârsta medie a pacienților înscriși a fost 65,9 ani, 70,0% dintre pacienți au fost bărbați, iar 95% dintre pacienți primeau medicamente concomitente. În Partea 2 a studiului, vârsta medie a fost de 63,8 ani, 78% au fost bărbați și 100% primeau medicamente concomitente.

Pacienții supuși procedurilor de cateterizare cardiacă de diagnosticare (Partea 1 și Partea 2) sau intervenționale (Partea 2) au fost eligibili pentru înrolarea în studiu. Procedurile au fost în conformitate cu standardul de îngrijire la fiecare dintre spitalele participante, urmate de utilizarea FemoSeal™ VCS. Datele pacienților au fost colectate la vizita inițială, în timpul procedurii și la 1 zi și 30 de zile după procedură. Rezultatele sunt sintetizate în **Tabelul 1.5** și indică faptul că FemoSeal™ VCS este sigur și eficient pentru utilizarea la această populație de pacienți.

**Tabelul 1.5 Rezultatele clinice raportate în studiul anterior introducerii pe piață**

|                                                                                                              | Partea 1    | Partea 2                 |

| Defecțiuni ale dispozitivului                                                                                | 0 (0%)      | 6 (10%)                  |

*<sup>a</sup>Pe baza dimensiunii totale a lotului de 58, deoarece la 2 pacienți nu s-a realizat hemostaza la momentul procedurii din cauza puncțiilor ipsilaterale anterioare. La acești pacienți, hemostaza a fost realizată la 7 minute și 37 de minute.*

*<sup>b</sup>Pe baza unei dimensiuni totale a lotului de 59: 1 pacient nu a fost inclus deoarece a fost trecut pe ventilator din cauza edemului pulmonar și nu a putut fi mobilizat timp de peste o săptămână.*

*<sup>c</sup>Definite drept complicații vasculare care necesită transfuzie de sânge sau reparație chirurgicală, sau infecție locală care necesită administrarea de antibiotice, spitalizare sau prelungirea spitalizării sau debridarea locului*

Nu au fost observate complicații vasculare majore în Partea 1 a studiului. În Partea 2 a studiului a fost raportată 1 complicație vasculară majoră: pseudoanevrism care a fost raportat în decurs de 1 zi după procedură. Evenimentul a necesitat compresia ghidată ecografică și o injecție cu trombină în pseudoanevrism, prelungind spitalizarea pacientului.

Dintre cele 5 evenimente adverse raportate în Partea 1 a studiului, a existat 1 eveniment advers posibil asociat dispozitivului: un eveniment minor de sângerare abundentă la 1 zi după procedură. Dintre cele 19 evenimente adverse raportate în Partea 2 a studiului, au fost observate 3 evenimente adverse minore de hematom asociate dispozitivului și s-au observat 6 evenimente minore posibil asociate dispozitivului, inclusiv 3 raportări de supurare persistentă, 2 de hematoame și 1 de durere de picior după exerciții fizice.

3 pacienți au fost considerați eșecuri ale tratamentului în Partea 2: 2 din cauza eșecului de a realiza hemostaza fără utilizarea compresiei și 1 din cauza complicației vasculare majore (pseudoanevrism). Nu au existat eșecuri ale tratamentului în Partea 1 a studiului.

Dintre cele șase defecțiuni ale dispozitivului în Partea 2 a studiului, trei nu au afectat procedura, una a fost atribuită erorii utilizatorului, una a fost scurgerea setului introdus și una a fost o articulație ruptă a filamentului. Ultimele două probleme au fost soluționate prin actualizări ale modelului implementate la C11202.

Partea 2 a studiului clinic anterior introducerii pe piață nu a raportat rezultatele urmăririi la 6 luni din cauza lipsei de complianță a pacienților. Rezultatele la 30 de zile ale studiului clinic anterior introducerii pe piață (EU-SE-001), în conformitate cu perioada de urmărire din literatura clinică, demonstrează că FemoSeal™ VCS este sigur și eficient.

#### **1.4.2 Rezumatul datelor din studiile clinice ulterioare introducerii pe piață**

Au existat 4 studii clinice ulterioare introducerii pe piață finalizate, descrise în **Tabelul 1.6** de mai jos. Aceste investigații clinice nu sunt publicate sau disponibile online.

**Tabelul 1.6 Studii clinice ulterioare introducerii pe piață, finalizate**

| Studii clinice ulterioare introducerii pe piață, finalizate                                    |                                                                    |                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                           |    |     |          |       |          |           |    |           |           |                         |          |                    |            |                     |           |                   |         |                       |          |                                |          |                      |           |                          |           |                                   |          |                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Studiul din 2006 a fost efectuat pentru a confirma siguranța și eficacitatea dispozitivului actual cu un sistem de introducere îmbunătățit și pentru a obține feedback privind instrucțiunile de utilizare și programul de instruire pentru FemoSeal™ VCS. Studiul a inclus 100 de pacienți și criteriul principal de evaluare a fost dacă s-a realizat hemostaza sau dacă au fost necesare compresii manuale sau mecanice suplimentare. Acest studiu a concluzionat că introducerea FemoSeal™ VCS a reușit în majoritatea cazurilor (în 91% dintre cazuri s-a realizat hemostaza imediată).

Studiul din 2008 a înregistrat 50 de pacienți pentru a evalua siguranța și performanța FemoSeal™ VCS la utilizarea în timpul rutinei clinice normale la pacienții supuși cateterizării cardiace cu o teacă de 7 Fr. Criteriul principal de evaluare a studiului a fost colectarea datelor privind timpul până la hemostază și timpul până la mobilizare postoperatorie fără compresie suplimentară, manuală sau mecanică. Rezultatele studiului au concluzionat că timpul mediu până la hemostază a fost de 57,8 secunde, iar toți pacienții au fost mobilizați după 4 ore de odihnă la pat.

Studiul din 2009 s-a referit la evaluarea noului ambalaj al FemoSeal™ VCS. În studiu au fost înscrși 25 de pacienți. Criteriul principal de evaluare a fost dacă utilizatorul a întâmpinat probleme cu ambalajul. Utilizatorii nu au observat nicio problemă privind noul ambalaj al FemoSeal™ VCS. Acest studiu a colectat, de asemenea, date privind timpul până la hemostază.

Obiectivul studiului din 2022 a fost acela de a colecta în mod proactiv date legate de siguranța și eficacitatea FemoSeal VCS în realizarea hemostazei la locul de abord al arterei femurale comune (CFA) la subiecți supuși procedurilor endovasculare percutanate într-un cadru clinic real. În studiu au fost înscrși 230 de pacienți. Criteriile principale de evaluare pentru registru sunt succesul procedurii (mai exact, hemostaza reușită la locul puncției) și reducerea complicațiilor majore (de exemplu, leziune vasculară, sângerare asociată locului de abord, infecție la locul de abord, compresie manuală repetată și ischemie acută ipsilaterală la nivelul picioarelor, legată de locul de abord). Studiul a concluzionat că FemoSeal™ VCS are performanțe bune în medii reale și asigură o hemostază eficientă și rate scăzute de complicații la locul de abord pentru pacienții supuși intervențiilor endovasculare periferice. Acesta demonstrează o performanță bună, cu un timp scurt până la hemostază și un feedback bun al operatorului privind utilitatea, ceea ce face ca FemoSeal™ VCS să fie un dispozitiv valoros pentru închiderea abordului femural.

### **1.4.3 Rezumatul datelor din monitorizarea clinică ulterioară introducerii pe piață**

#### **1.4.3.1 Monitorizare clinică finalizată ulterioară introducerii pe piață**

Un rezumat al activităților de urmărire clinică ulterioare introducerii pe piață finalizate este descris în **Tabelul 1.7** de mai jos.

**Tabelul 1.7. Activități de monitorizare clinică ulterioară introducerii pe piață**

| Activități de monitorizare clinică ulterioară introducerii pe piață, finalizate |             |                                                             |                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Terumo Medical Corporation a finalizat trei sondaje privind înalta calitate în rândul utilizatorilor medici în perioada de raportare curentă (1 septembrie 2019 - 31 august 2024).

Studiile clinice pentru FemoSeal™ au colectat date clinice proactive în ceea ce privește siguranța și performanța FemoSeal™ VCS în timpul utilizării clinice. Studiul a inclus întrebări axate pe dispozitivul general și accesoriile asociate, inclusiv firul de ghidaj de 0,038" și interacțiunile directe ale acestora. Studiile clinice pentru firul de ghidaj au colectat date clinice proactive în ceea ce privește siguranța și performanța în timpul utilizării clinice a firului de ghidaj de 0,038" furnizat împreună cu FemoSeal™ VCS. Întrebările din studiu s-au concentrat în mod specific pe utilizarea generală a firului de ghidaj, de la introducerea prin teaca procedurală în vasculatură până la scoaterea firului.

Firele de ghidaj FemoSeal™ VCS și 0,038" incluse cu dispozitivul au primit toate evaluări acceptabile iar șase (6) reclamații au fost depuse pentru dispozitiv și nouă (9) non-reclamații pentru firul de ghidaj pe baza evaluării comentariilor primite din studiile clinice de înaltă calitate. Reclamațiile au fost evaluate atât pentru FemoSeal, cât și pentru firul de ghidaj, și au fost evaluate ca parte a procesului Terumo de urmărire ulterioară introducerii pe piață. Nu au fost identificate riscuri și/sau niveluri de risc noi.

În 2024, ca parte a activităților PMCF, a fost finalizat un sondaj la utilizatorii medici. Rezultatele sondajului au demonstrat că evaluarea performanței și siguranței FemoSeal™ VCS au fost în general foarte favorabile. Compatibilitatea altor fire de ghidare decât cel standard furnizat împreună cu FemoSeal™ VCS a fost, de asemenea, demonstrată.

#### **1.4.3.2 Urmărire clinică ulterioară introducerii pe piață în curs/planificată**

TMC are o activitate de monitorizare clinică ulterioară introducerii pe piață în curs/planificată. Se va realiza un studiu clinic pentru a colecta în mod prospectiv feedback legat de utilizarea firului de ghidaj cu FemoSeal VCS distribuit pe piața UE. Studiul va fi completat de medici pentru a studia care sunt firele de ghidaj utilizate în timpul procedurii. Scopul acestui sondaj este de a aborda o lacună identificată ca fiind lipsa literaturii de specialitate și a comentariilor revizorului extern cu privire la compatibilitatea FemoSeal™ VCS cu utilizarea altor fire de ghidare de la alte mărci decât Terumo. Feedbackul include rezultatele tehnice, performanța clinică și siguranța în ceea ce privește performanța dispozitivului cu diferite fire de ghidaj.

#### **1.4.4 Rezumatul datelor din analiza sistematică a literaturii de specialitate**

Terumo Medical Corporation desfășoară revizuri sistematice ale literaturii de specialitate pentru a colecta și evalua date privind siguranța și performanța clinică din studii publicate despre FemoSeal™ VCS și/sau dispozitive similare. Scopul examinării anuale a literaturii de specialitate publicate este de a identifica reacții adverse necunoscute anterior, de a monitoriza reacțiile adverse cunoscute, de a identifica riscurile emergente și de a identifica posibila utilizare necorespunzătoare sistematică sau utilizare în alte indicații decât cele menționate a FemoSeal™ VCS.

Cea mai recentă analiză sistematică a literaturii de specialitate, care a acoperit perioada 1 septembrie 2019 - 31 august 2024, a identificat 29 de studii publicate care au furnizat date privind siguranța și performanța clinică a dispozitivului FemoSeal™ VCS. Douăzeci și trei de referințe au raportat utilizarea FemoSeal™ VCS conform indicațiilor menționate, iar utilizarea în afara indicațiilor menționate a fost raportată în nouă studii. În general, analiza literaturii de specialitate asociată studiilor specifice utilizării FemoSeal™ VCS indică o populație de studiu reprezentativă pentru pacienții din UE supuși procedurilor de cateterizare vasculară percutanată. Consultați **Secțiunea 3** pentru o listă a acestor 23 de publicații revizuite de omologi în care utilizarea a avut loc conform indicațiilor menționate.

Performanța clinică a fost evaluată prin următoarele măsurători:

- Timpul până la hemostază este mai bun decât sau comparabil cu stadiul actual al tehnicii pentru închiderea percutanată a arterei femurale comune.
- Timpul până la mobilizarea postoperatorie este mai bun decât sau comparabil cu stadiul actual al tehnicii pentru închiderea percutanată a arterei femurale comune.
- Rata complicațiilor postoperatorii este comparabilă cu sau mai redusă decât cea menționată pentru tratamentele standard actuale.

Pe baza acestor măsurători ale performanței clinice, datele din această analiză a literaturii de specialitate au indicat că FemoSeal™ VCS poate fi utilizat cu succes la închiderea puncției arteriale femurale (arteriotomie) la pacienții care au fost supuși cateterizării percutanate utilizând o teacă procedurală de 7 Fr sau mai mică. Hemostaza completă a fost obținută la majoritatea pacienților (79,65-100%) din cazuri și a fost asociată cu un timp mediu până la hemostază de 0,5 minute, timp mediu până la externare de 3 zile. Între 69,2 și 86,7% dintre pacienți au reușit să se deplaseze la 5 ore după închidere, cu o durată medie de repaus postoperatoriu de 349 min. Eșecul FemoSeal™ VCS a fost observat în 3,68-4% dintre cazuri, iar compresia manuală suplimentară a fost necesară în 0,9-4,4% dintre proceduri.

Siguranța clinică a fost evaluată în funcție de evenimentele adverse, inclusiv, dar fără a se limita la:

- Sângerare
- Hematom
- Pseudoanevrism
- Echimoză
- Fistulă arteriovenoasă
- Infecție
- Deces

Pentru fiecare dintre aceste evenimente adverse, frecvența raportată pentru FemoSeal™ VCS în studiile incluse a fost mai mică sau comparabilă cu cele raportate anterior pentru compresia manuală și alte dispozitive de închidere vasculară.

La examinarea a 10 rapoarte de caz nu au fost identificate evenimente adverse, deoarece nu au fost identificate riscuri noi, neanticipate, emergente sau inacceptabile.

Eficacitatea generală a utilizării FemoSeal™ VCS în timpul angiografiei de diagnostic sau al intervențiilor chirurgicale depinde de mai mulți factori, cum ar fi: sexul, vârsta, anatomia pacientului, comorbiditățile, amplasarea anatomică a locului puncției, experiența chirurgului, metoda de amplasare a VCD, îngrijirea postoperatorie, etc. Pe lângă succesul tehnic, inclusiv

obținerea hemostazei, FemoSeal™ VCS a oferit beneficii clinice în ceea ce privește închiderea vasculară după puncția arterială femurală, cum ar fi reducerea timpului până la hemostază, reducerea timpului până la mobilizare. Rezultatele privind performanța dispozitivului FemoSeal™ VCS sunt în concordanță cu cele preconizate pentru acest tip de dispozitiv atunci când este utilizat conform destinației. Unele dintre referințele obținute în timpul perioadei de căutare curente au arătat utilizarea dispozitivului vizat într-o altă locație anatomică decât artera femurală comună și pentru închiderea arteriotomiei >7 Fr, care este considerată a fi în afara indicațiilor menționate.

În timpul revizuirii nu au fost identificate efecte secundare necunoscute, riscuri emergente sau posibile utilizări necorespunzătoare sistematice ale dispozitivului. Cu toate acestea, dacă FemoSeal™ VCS este utilizat cu atenție de către medici instruiți, dispozitivul medical funcționează ca un dispozitiv clinic util și necesar. În general, terapia-țintă și, prin urmare, FemoSeal™ VCS abordează nevoia clinică existentă în prezent în tratamentul complicațiilor asociate accesului vascular.

În general, datele din această analiză a literaturii de specialitate nu au identificat nicio problemă de performanță sau de siguranță în mediul clinic care să nu fi fost cunoscută anterior sau efecte adverse care să fi avut loc cu frecvențe mai mari decât cele anticipate/acceptabile. Prin urmare, din această analiză a literaturii de specialitate se poate concluziona că FemoSeal™ VCS, atunci când este utilizat pentru a asigura compresia pentru hemostază la arteriotomie după cateterizarea percutanată, continuă să funcționeze conform așteptărilor și nu este asociat cu evenimente grave în materie de siguranță.

#### **1.4.5 Rezumatul datelor din supravegherea ulterioară introducerii pe piață**

Este implementat un sistem PMS proactiv și o analiză a tuturor reclamațiilor este efectuată lunar și în conformitate cu procedurile interne de producție. Datele privind reclamațiile au fost analizate în perioada 1 septembrie 2019 - 31 august 2024. În total au existat 28 de rapoarte de vigilență privind dispozitivele medicale (MDV) și 476 de rapoarte cu reclamații ale clienților trimise producătorului. Dintre cele 28 de rapoarte MDV, 27 au fost asociate cu evenimente adverse și unul cu funcționarea defectuoasă a dispozitivului. Au existat două decese în perioada de raportare, dar niciunul dintre decesele raportate nu a fost considerat a fi asociat cu dispozitivul vizat. Dintre cele 476 de reclamații adresate producătorului, cele mai frecvente motive pentru reclamații au fost dificultățile de amplasare (146 de apariții, rata de apariție de 0,0142%). Modul de eroare al evenimentelor de extragere este al doilea cel mai frecvent, cu o rată de 0,0126% (130 evenimente).

FemoSeal™ Vascular Closure System a fost comercializat în 1.053.639 de unități la nivel global și 827.833 în Spațiul Economic European. Frecvența calculată a reclamațiilor raportate la vânzările globale este de 0,046%. Rata totală de reclamații ale clienților este foarte scăzută. Nu au fost identificate riscuri noi care să nu fie incluse în Instrucțiunile de utilizare și în documentația privind riscurile.

Frecvențele de apariție a efectelor secundare nedorite sunt prezentate în **Tabelul 1.2**. În rândul reclamațiilor nu au fost identificate riscuri noi neanticipate, emergente sau inacceptabile. Nu au existat creșteri semnificative ale frecvenței sau severității reacțiilor adverse cunoscute.

#### **1.4.6 Rezumatul general al caracteristicilor de performanță clinică și siguranță**

FemoSeal™ VCS este indicat pentru utilizarea la închiderea puncției arteriale femurale comune (arteriotomie) la pacienții care au fost supuși cateterizării percutanate utilizând o teacă procedurală de 7 F (2,33 mm) sau mai mică. Această evaluare clinică se bazează pe o analiză cuprinzătoare a datelor clinice și a literaturii de specialitate disponibile anterior și ulterior introducerii pe piață relevante pentru utilizarea prevăzută a FemoSeal™ VCS.

A fost efectuată o analiză complexă a literaturii de specialitate publicate în perioada 1 septembrie 2019 - 31 august 2024. Dovezile au inclus 29 de studii pentru FemoSeal™ VCS. Dovezile furnizate în cadrul evaluării clinice concluzionează că, atunci când este utilizat conform indicațiilor, dispozitivul vizat este sigur și eficient, iar orice riscuri sau reacții adverse nedorite care pot fi asociate cu dispozitivul în condiții normale de utilizare constituie riscuri acceptabile atunci când sunt analizate în raport cu beneficiile pentru pacient. Rezultatele privind performanța dispozitivelor vizate sunt în concordanță cu cele preconizate pentru acest tip de dispozitiv atunci când este utilizat conform destinației.

Potențialele reacții adverse nedorite asociate cu utilizarea FemoSeal™ VCS includ evenimentele adverse raportate în mod obișnuit cu mijloace alternative de închidere a arteriotomiei, de ex., sângerare și hematom. În general, frecvențele de apariție a evenimentelor adverse raportate în legătură cu utilizarea FemoSeal™ VCS sunt similare cu frecvențele raportate în cazul compresiei manuale și al dispozitivelor de închidere vasculară similare. În mod specific, pentru sângerare și hematom, frecvențele raportate pentru FemoSeal™ VCS sunt mai mici decât frecvențele raportate pentru dispozitivele de închidere vasculară similare. Fiecare eveniment advers raportat, atât din literatura de specialitate publicată, cât și din urmărirea ulterioară introducerii pe piață, fusese identificat anterior (consultați **Secțiunea 1.3**).

Datele existente privind siguranța și performanța clinică a FemoSeal™ VCS sugerează că beneficiile pacientului ca urmare a utilizării acestui dispozitiv de închidere vasculară depășesc riscurile posibile atunci când este utilizat în conformitate cu Instrucțiunile de utilizare.

După cum s-a arătat în secțiunile anterioare de mai sus, datele furnizate pentru FemoSeal™ VCS demonstrează consecvența dintre datele referitoare la dispozitivul evaluat (de exemplu, utilizarea dispozitivului, rezultatele privind siguranța, performanța clinică și beneficiile clinice), dispozitivele echivalente identificate și datele referitoare la dispozitivele similare enumerate în stadiul actual al tehnicii.

Analiza încrucișată a datelor de siguranță nu a identificat niciun fel de lacune între următoarele:

- datele menționate în stadiul actual al tehnicii;
- datele specifice dispozitivului în curs de evaluare;
- datele menționate în Fișierul(ele) de gestionare a riscurilor
- datele menționate pe etichetă și/sau în Instrucțiunile de utilizare (de exemplu, riscurile reziduale care trebuie transmise utilizatorului sunt abordate).

Siguranța clinică a fost demonstrată prin rate reduse de complicații, identificate în literatura clinică publicată, cu cercetări comparative, studii clinice sponsorizate de companie, revizuirea datelor ulterioare introducerii pe piață, asociate cu lipsa retragerilor de pe piață. Nu au fost identificate probleme cu privire la performanță; literatura de specialitate revizuită a inclus utilizarea dispozitivului FemoSeal™ VCS, care a fost în concordanță cu utilizarea prevăzută a producătorului.

### 1.5 Posibile alternative de diagnostic sau terapeutice

Compresia manuală este utilizată în mod tradițional pentru a realiza hemostaza la locul arteriotomiei după cateterizările vasculare. Compresia manuală a fost asociată cu imobilizarea pacientului perioade lungi de timp (până la 8 ore după o procedură) și cu disconfort substanțial și șederi prelungite în spital. În cadrul unei analize sistematice recente, s-a constatat că timpul median pentru realizarea hemostazei cu compresie manuală a fost de 20,8 minute.<sup>1</sup>

Alternativele la compresia manuală includ dispozitive hemostatice externe care aplică compresie mecanică la locul arteriotomiei. Aceste dispozitive nu scurtează timpul până la hemostază sau timpul până la mobilizare postoperatorie, ci reduc necesarul de personal prin înlocuirea compresiei manuale cu compresia mecanică. Frecvențele evenimentelor adverse asociate cu utilizarea compresiei mecanice sunt similare cu frecvențele în cazul compresiei manuale.

Dispozitivele de închidere vasculară, cum ar fi FemoSeal™ VCS, sunt concepute pentru a închide arteriotomia. Scopul acestora este de a reduce timpul până la hemostază și de a permite mobilizarea postoperatorie timpurie. În cadrul unei analize sistematice recente care a inclus 13 dispozitive disponibile pe piață, s-a constatat că timpul median pentru obținerea hemostazei cu un dispozitiv de închidere vasculară este de 5,4 minute. Timpul mediu de hemostază pentru dispozitivele individuale de închidere vasculară a variat de la 1 minut (FemoSeal™ VCS) la 14 minute, majoritatea dispozitivelor înregistrând între 4 și 10 minute.<sup>1</sup>

Evenimentele adverse raportate frecvent asociate cu închiderea locului arteriotomiei cu compresii manuale, dispozitive hemostatice externe sau dispozitive de închidere vasculară includ hematom, sângerare la locul de abord, pseudoanevrism, fistulă arteriovenoasă și infecție. În cadrul aceleiași analize sistematice (34 de studii randomizate și controlate, 14.401 pacienți), s-a constatat că ratele evenimentelor adverse sunt similare între compresia manuală și utilizarea

dispozitivelor de închidere vasculară, cu excepția faptului că hemoragia a avut tendința de a fi puțin mai mare cu dispozitivele de închidere vasculară.<sup>1</sup>

## 1.6 Profil de utilizator și instruire recomandate

Utilizatorii propuși ai FemoSeal™ Vascular Closure System sunt medici cu instruire care îi califică pentru efectuarea abordului arterial și a închiderii pentru procedurile endovasculare prin artera femurală comună și care au participat la programul de instruire pentru medici al Terumo Medical Corporation FemoSeal™.

## 1.7 Standarde armonizate și comune relevante

Настоящая сводная информация о безопасности и клинических характеристиках (SSCP) предназначена для предоставления общественности доступа к обновленному краткому описанию основных аспектов безопасности и клинических характеристик системы закрытия сосудов FemoSeal™ Vascular Closure System (VCS).

Сводная информация о безопасности и клинических характеристиках устройства, предназначенная для пользователей / медицинских работников, приведена в **разделе 1.0**.

## **1.0 СВОДНАЯ ИНФОРМАЦИЯ ДЛЯ ПОЛЬЗОВАТЕЛЕЙ / МЕДИЦИНСКИХ РАБОТНИКОВ**

Сводная информация не заменяет инструкцию по эксплуатации в качестве основного документа, обеспечивающего безопасное использование устройства, и не предназначена для предоставления диагностических или терапевтических рекомендаций предполагаемым пользователям или пациентам. Сводная информация не предназначена для замены обязательной информации, содержащейся в картах имплантата или других обязательных документах.

### **1.1 Предполагаемая область применения устройства**

#### **1.1.1 Область применения**

FemoSeal™ Vascular Closure System представляет собой медицинское устройство, предназначенное для закрытия артериальной пункции после чрескожной катетеризации через общую бедренную артерию.

#### **1.1.2 Показания к применению**

FemoSeal™ Vascular Closure System показана к применению при закрытии общей бедренной артериальной пункции (артериотомии) у пациентов, которым проводилась чрескожная катетеризация с использованием процедурного интродьюсера размером 7F (2,33 мм) или меньше.

#### **1.1.3 Противопоказания и/или ограничения**

FemoSeal™ Vascular Closure System противопоказана пациентам с артериотомией, при которой использовались интродьюсеры или устройства размером более 2,33 мм (7F).

#### **1.1.4 Целевые группы пациентов**

Безопасность и эффективность FemoSeal™ Vascular Closure System установлены у пациентов в возрасте 18 лет и старше, которым проводилась чрескожная катетеризация с использованием процедурного интродьюсера размером 7F (2,33 мм) или меньше.

#### **1.1.5 Особые группы пациентов**

Безопасность и эффективность FemoSeal™ Vascular Closure System не установлена для следующих групп пациентов:

- пациенты с предшествующим аутоиммунным заболеванием.
- пациенты, проходящие терапевтический тромболиз.
- пациенты с клинически значимым заболеванием периферических сосудов.

- пациенты с неконтролируемой гипертензией ( $> 220$  мм рт. ст. систолического давления или  $> 110$  мм рт. ст. диастолического давления).
- пациенты с нарушением кровотечения, включая тромбоцитопению ( $< 100\,000$  тромбоцитов) или анемию ( $Hgb < 10$  мг/дл).
- пациенты с внутренним просветом общей бедренной артерии менее 5 мм.
- пациенты с нарушениями функции почек и/или печени.
- пациенты с другими сопутствующими заболеваниями.
- группы пациентов определенного расового и/или этнического происхождения.
- пациенты с инфарктом миокарда в течение 72 часов.
- пациенты с сосудистым имплантатом или стентом в месте пункции.
- беременные или кормящие пациентки.
- Пациенты в возрасте до 18 лет.

### 1.1.6 Предполагаемые пользователи

Предполагаемыми пользователями FemoSeal™ Vascular Closure System являются врачи, прошедшие обучение и имеющие квалификацию для выполнения артериального доступа и закрытия при эндоваскулярных процедурах с использованием общей бедренной артерии, и принявшие участие в программе обучения врачей Terumo Medical Corporation FemoSeal™.

## 1.2 Описание устройства

### 1.2.1 Описание устройства

Система закрытия сосудов FemoSeal™ Vascular Closure System производства компании Terumo Medical Corporation (TMC) представляет собой рассасывающееся устройство для закрытия сосудов, предназначенное для достижения гемостаза бедренной артерии после чрескожной катетеризации через общую бедренную артерию.

Закрывающие элементы FemoSeal™ состоят из двух рассасывающихся полимерных дисков, внутреннего уплотнителя и наружного закрывающего диска, которые удерживаются вместе рассасывающейся многоволоконной шовной нитью, таким образом механически герметизируя артериотомию (см. **рис. 1.1** и **рис. 1.2**). После доставки через интродьюсер с конической оболочкой внешний закрывающий диск устанавливается на многоволоконный жгут шовного материала, что приводит к механическому закрытию места пункции между внутренним и внешним закрывающим диском. Внутреннее уплотнение и внешний закрывающий диск удерживаются на месте трением о

многоволоконный жгут. Гемостаз достигается механическим способом. Закрывающие элементы разлагаются в результате гидролиза.

Имплантируемые закрывающие компоненты, внутренний уплотнитель и внешний закрывающий диск разлагаются через восемнадцать (18) месяцев, в то время как многоволоконная шовная нить, по оценкам, разлагается и биоабсорбируется в результате гидролиза окружающей ткани через два (2) – три (3) года. Возможность поддержания сжатия имплантируемых закрывающих компонентов на артериотомии была проверена в течение восьми (8) часов. Продукты распада метаболизируются и выделяются с мочой или выводятся через легкие в виде углекислого газа. В исследованиях на животных эффекты накопления не наблюдались. Дополнительными компонентами FemoSeal™, контактирующими с живой тканью или кровью во время процедуры, являются интродьюсер с конической оболочкой, дилататор, закрывающая трубка, толкатель и проводник.

**Рис. 1.1 Внутреннее уплотнение и внешний закрывающий диск, соответственно**

**Рис. 1.2 Установлены внутреннее уплотнение и внешний закрывающий диск**

Устройство FemoSeal™ упаковано вместе с дилататором и проводником с наружным диаметром 0,038 дюйма (0,97 мм), длиной 27,5 дюйма (70 см) и J-образным кончиком, см.

**рис. 1.3** ниже. Проводник содержится в полиэтиленовой трубке. Все детали упакованы в прочный бумажный лоток. Упаковка также включает карту имплантата пациента.

FemoSeal™ Vascular Closure System не требует дополнительных принадлежностей для надлежащего функционирования. Устройство предназначено для использования только с дилататором и проводником, входящими в комплект поставки.

\* Имплантируемая часть устройства; имплантируемые компоненты не препятствуют проведению МРТ

Система FemoSeal™ VCS стерилизована этиленоксидом (ЭО) и является одноразовым медицинским устройством. Устройство FemoSeal™ VCS сконструировано таким образом, что его нельзя использовать повторно.

**Принцип действия**

Система FemoSeal™ VCS способствует механическому гемостазу путем размещения имплантируемых закрывающих элементов внутри и снаружи общей бедренной артерии. Механизм, предотвращающий кровотечение, обеспечивается внутренним уплотнением,

которое герметизирует место пункции, и внешним закрывающим диском, который удерживает внутренний уплотнитель на месте.

### 1.2.3 Клинические преимущества

Система FemoSeal™ VCS обеспечивает следующие клинические преимущества по сравнению с закрытием сосудов после пункции общей бедренной артерии:

- Сокращение времени до гемостаза<sup>1</sup>
- Сокращение времени до восстановления способности передвигаться<sup>1</sup>

### 1.2.4 Предыдущие поколения или варианты

- Первая версия FemoSeal™ VCS (#11200) поступила на европейский рынок в 2005 году и частично в 2006 году.
- Актуальная система FemoSeal™ VCS (#11202) с улучшенной системой доставки представлена на рынке с 28 марта 2006 года.

### 1.2.5 Принадлежности, предназначенные для использования с устройством

Устройство FemoSeal™ поставляется в упаковке с дилататором с внешним диаметром 0,038 дюйма (0,97 мм) и проводником длиной 27,5 дюйма (70 см) и J-образным кончиком. Проводник является принадлежностью устройства FemoSeal™. J-образный кончик является компонентом проводника, а дилататор является компонентом устройства FemoSeal™. Проводник является единственной рассматриваемой принадлежностью. Проводник содержится в полиэтиленовой трубке. Все детали упакованы в прочный бумажный лоток. Упаковка также включает карту имплантата пациента. FemoSeal™ Vascular Closure System не требует дополнительных принадлежностей для надлежащего функционирования. Устройство предназначено для использования только с дилататором и проводником, входящими в комплект поставки.

### 1.2.6 Другие устройства и изделия, предназначенные для использования с устройством

Система FemoSeal™ VCS не требует дополнительных устройств для надлежащего функционирования.

### 1.3 Риски и предупреждения

#### 1.3.1 Остаточные риски и нежелательные последствия

Известные или предсказуемые нежелательные явления, вред и осложнения, связанные с использованием устройства Femo-Seal™ VCS в результате остаточного риска, перечислены в **таблице 1.2**. Частота возникновения основана на анализе документации по рискам и рассчитывается на основе данных послепродажных наблюдений с 1 сентября 2019 года по 31 августа 2024 года. Неизвестных остаточных рисков для FemoSeal™ VCS нет, и все применимые риски были рассмотрены в инструкции по эксплуатации и процессе управления рисками.

**Таблица 1.2. Неблагоприятные явления/осложнения с устройством FemoSeal**

| Вред                      | Частота возникновения (%) | Смягчающие факторы                                                                                                                                             |

### 1.3.2 Предупреждения и меры предосторожности

#### Предупреждения

1. Не используйте изделие, если упаковка повреждена или если не сохранена целостность стерильной барьерной системы.
2. Не используйте изделие после истечения срока годности – биоразлагаемые компоненты могут вести себя ненадлежащим образом.
3. Не используйте изделие, если какие-либо его элементы имеют признаки повреждения или неисправности.
4. Использование системы FemoSeal™ Vascular Closure System в тех случаях, когда возможно бактериальное загрязнение процедурного интродьюсера или окружающих тканей, может привести к инфицированию.
5. При подозрении на пункцию задней стенки артерии или пункцию нескольких артерий не полагайтесь исключительно на систему FemoSeal™ Vascular Closure System для достижения артериального гемостаза. Используйте дополнительное ручное или механическое сжатие.
6. Если место пункции находится на уровне или дистальнее бифуркации бедренной артерии, систему FemoSeal™ Vascular Closure System не следует использовать из-за риска неправильного размещения внутреннего уплотнителя. Это может привести к осложнениям кровотечения и/или нарушению нормального потока крови.
7. При наличии непрекращающегося артериального кровотечения из места разреза не разрезайте многоволоконную шовную нить до достижения гемостаза. Если гемостаз не достигается, зафиксируйте многоволоконную шовную нить стерильной повязкой для ран и примените дополнительное сжатие до достижения гемостаза. В

случае непрекращающегося артериального кровотечения могут возникнуть значительные геморрагические осложнения, которые могут привести к травмированию или смерти пациента.

8. Не используйте систему FemoSeal™ Vascular Closure System, если место пункции расположено проксимально относительно паховой связки, так как это может привести к забрюшинной гематоме.
9. Пациенты с повышенным риском кровотечения могут страдать от повышенной кровопотери, что потребует трансфузии.
10. Отсоединение внутреннего диска может привести к тромбозу и (или) эмболии.

### **Меры предосторожности**

1. Процедура установки системы FemoSeal™ Vascular Closure System должна выполняться врачами, прошедшими соответствующее обучение использованию устройства.
2. Выполните ограниченную бедренную ангиограмму или пункцию бедренной артерии под ультразвуковым контролем, прежде чем устанавливать систему закрытия сосудов FemoSeal™ Vascular Closure System.
3. Прекратите процедуру, если:
  - диаметр просвета общей бедренной артерии < 5 мм.
  - имеет место стеноз и (или) существенные бляшки вблизи места пункции общей бедренной артерии.
  - пункция артерии выполняется в месте бифуркации бедренной артерии или дистальнее него.
  - аномальные ветви или аномалии сосудов присутствуют вблизи места пункции общей бедренной артерии.
4. При наличии гематомы необходимо соблюдать особую осторожность при правильной установке интродьюсера с конической оболочкой в артерию.
5. Используйте методику одностенной пункции. Не выполняйте пункцию задней стенки артерии.
6. При использовании системы FemoSeal™ Vascular Closure System всегда соблюдайте стерильность.
7. Система FemoSeal™ Vascular Closure System предназначена только для одноразового использования и не должна повторно стерилизоваться или использоваться каким-либо образом. Устройство FemoSeal™ сконструировано таким образом, что его нельзя использовать повторно.

8. Если при установке внутреннего уплотнения возникает неожиданное сопротивление, прекратите процедуру.
9. Для правильного размещения внутреннего уплотнения переместите большой палец таким образом, чтобы кнопка могла свободно отскочить назад.
10. Перед установкой внешнего закрывающего диска убедитесь, что интродьюсер с конической оболочкой устройства FemoSeal™ находится под поверхностью кожи. У пациентов с небольшим расстоянием между бедренной артерией и уровнем кожи внешний закрывающий диск может случайно установиться выше уровня кожи.
11. Для правильного размещения может потребоваться надрез кожи перед установкой системы.
12. Если внутреннее уплотнение находится внутри артерии, но не удастся полностью нажать кнопку и установить внешний закрывающий диск, может потребоваться хирургическое вмешательство для удаления закрывающих элементов FemoSeal™.
13. Если в течение 18 месяцев будет необходимо выполнить повторную пункцию, ее следует выполнять по меньшей мере на один сантиметр проксимальнее предыдущего места доступа системы FemoSeal™ Vascular Closure System.
14. Попросите пациента следовать указаниям врача, касающимся осмотра места закрытия пункции.
15. Попросите пациента носить карту пациента с информацией о пациенте в течение следующих 18 месяцев

### **Меры предосторожности при выписке**

Перед рассмотрением вопроса о выписке оцените состояние пациента по следующим клиническим показаниям:

1. кровотечение и/или гематома в месте закрытия пункции.
2. Боль при ходьбе.
3. Признаки инфекции в месте закрытия пункции.

### **1.3.3 Корректирующие действия по эксплуатационной безопасности**

В период с 01 сентября 2019 г. по 31 августа 2024 г. в системе FemoSeal™ VCS было выполнено одно корректирующее действие по эксплуатационной безопасности.

В 2022 г. компания Terumo добровольно отозвала систему FemoSeal™ VCS из-за жалоб на сбой в технологическом процессе и тестировании выпуска партии изделия FemoSeal производства компании Elkton для измерения усилия прижима и усилия втягивания. В общей сложности из Южной Кореи было отозвано 950 единиц.

## 1.4 Клиническая оценка и послепродажный клинический контроль

**Таблица 1.3** включает список базовых исследований, включенных для вывода системы FemoSeal™ VCS на рынок, а также послепродажные исследования и послепродажный клинический контроль. Версия устройства, используемая в исследовании, включена в таблицу ниже. Первая версия FemoSeal™ VCS (#11200) появилась на рынке до 2006 года, а следующая версия (#C11202) была выпущена на рынок в 2006 году, именно она предлагается на рынке в настоящее время.

**Таблица 1.3 Сводная информация по базовым клиническим исследованиям**

| Предпродажное функциональное тестирование на животных                                                                                                                                                                                                                   | Версия устройства              |

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002</p> <p>Radi Medical System AB</p> <p>Выполнено компанией Biomatech, Франция</p> | <p>Исследование на животных</p> | <p>Цель исследования состояла в оценке биосовместимости и биофункциональной возможности биоразлагаемого имплантата, предназначенного для достижения гемостаза в сосудистой системе. Испытанное устройство предназначалось для введения в отверстие для пункции в артериях с целью достижения гемостаза. Один диск вошел в отверстие для пункции артерии, а другой затянул внутренний диск снаружи артерии. Оба</p> | <p>Период имплантации / последующего наблюдения составляет 5 недель для всех животных</p> <p>4 овцы, 1 свинья</p> <p>14 закрывающих элементов</p> <p>8 закрывающих элементов, имплантированных на 2 овцах,</p> <p>2 закрывающих элемента, имплантированных на 1 свинье</p> | <p>Регистрировались любые признаки неблагоприятного воздействия (воспаление, некроз, кровоизлияние или любое другое повреждение) или образование тонкого псевдоинтимального слоя. Особое внимание было уделено первоначальной тканевой интеграции устройства с особым акцентом на инкапсуляцию внутреннего диска.</p> <p>При макроскопическом исследовании не наблюдалось</p>                                                                                                                                                                                                                                                                                                                                         |

|  |  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|  |  |  | <p>диска вводились через интродьюсер. Диски были разработаны для предотвращения кровотечения, заживления в стенке сосуда и, наконец, разложения и рассасывания. Исследование было разработано для сбора и анализа данных после функциональной имплантации на овцах и свиньях для оценки способности имплантата сохранять физиологическую функцию при использовании в системе кровообращения, для определения реакции организма-хозяина и реакции устройства (физическая целостность, тканевая инкапсуляция при умерщвлении) и для оценки деградации имплантата</p> | <p>После имплантации двух закрывающих элементов в одну и ту же бедренную артерию их имплантировали на расстоянии &gt; 30 мм</p> | <p>значительных признаков местной непереносимости или образования тромба. Макроскопическое наблюдение не выявило никакой разницы между овцами или свиньей после имплантации закрывающих элементов в бедренные артерии. При макроскопическом исследовании не наблюдалось значительных признаков местной непереносимости или образования тромба. Макроскопическое наблюдение не выявило никакой разницы между овцами или свиньей после имплантации закрывающих элементов в бедренные артерии.</p> <p>Гистопатологический анализ места имплантации на овцах не выявил локальных неблагоприятных реакций. Внутренние и наружные диски имели признаки разрушения и в некоторых случаях были разбиты на более мелкие части. Внутренние диски были полностью интегрированы в неоинтимальную ткань. В ходе гистопатологического анализа на свинье наблюдались несколько больше воспалительных признаков вокруг внутренних и наружных дисков. У обоих животных многоволоконная нить</p> |

В рамках плана разработки FemoSeal™ VCS до выхода на рынок были проведены три функциональных теста на животных. В 2000 году, до начала клинических исследований, было проведено исследование на животных для оценки биофункциональности системы FemoSeal™ VCS. В данном исследовании оценивалась способность закрывающих элементов сохранять физиологическую функцию и определялась степень их деградации. Через 18 месяцев материал внутреннего и наружного дисков больше не был виден, его заменила эндолумбальная фиброзная ткань. В заключение было подтверждено способность закрывающего элемента FemoSeal™ VCS сохранять физиологическую функцию при использовании в системе кровообращения.

В 2002 году было проведено исследование на животных для оценки биосовместимости и биофункциональной возможности биоразлагаемого имплантата FemoSeal™ VCS, предназначенного для достижения гемостаза в сосудистой системе. Таким образом, разложение имплантата было почти завершено к 36 неделям, и существенных неблагоприятных тканевых реакций не наблюдалось.

В другом исследовании на животных, проведенном в 2002 году, оценивались биосовместимость и биофункциональность биоразлагаемого имплантата FemoSeal™ VCS, предназначенного для достижения гемостаза в сосудистой системе. Через 5 недель инкапсуляция диска была завершена, и наблюдались признаки разложения внутренних и внешних дисков. В заключение была подтверждена способность имплантата поддерживать физиологическую функцию при использовании в системе кровообращения.

В рамках плана клинических разработок системы FemoSeal™ VCS компания Radi Medical System AB провела предпродажное маркетинговое клиническое исследование. Данное клиническое исследование не опубликовано и недоступно в Интернете. Исследование с использованием устройства модели #11200 было проведено в 2002-2004 гг. в соответствии с европейским стандартом EN 540 (Клинические исследования медицинских устройств на людях) и в соответствии с Общими положениями ICH по клиническим испытаниям и Руководством по надлежащей клинической практике. Подробные сведения об этом исследовании приведены в отчете EU-SE-001. Клиническое исследование было задокументировано в итоговом отчете компании Radi Medical Systems AB «Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures». Клиническое исследование было проведено с использованием FemoSeal™ первой модели #11200 и было посвящено безопасности и действенности имплантируемых закрывающих компонентов.

Единственное различие между первой моделью #11200 и текущей моделью, C11202, заключается в размере по французской шкале, 6F и 7F соответственно, и улучшенной системе доставки. Клинические преимущества, целевое использование, принципы работы и исходные материалы имплантируемых закрывающих элементов, внутреннего уплотнителя и внешнего закрывающего диска остаются неизменными.

Устройство предназначалось для пациентов, проходящих диагностические кардиологические или интервенционные процедуры с использованием бедренной артерии в качестве точки доступа. Целью данного исследования было определение безопасности, производительности и эффективности системы FemoSeal™ VCS. Это было перспективное, многоцентровое, несравнительное открытое исследование с 30-дневным контролем.

Первичной конечной точкой оценки эффективности было время до гемостаза, определяемое как отсутствие острого кровотечения. Первичной конечной точкой безопасности была частота серьезных сосудистых осложнений в течение 30 дней. Вторичные конечные точки включали время до восстановления способности передвигаться, долю неудачного лечения, частоту нежелательных явлений и характеристики устройства во время доставки и размещения.

Пациенты, включенные в данное исследование, были взрослыми, способными дать информированное согласие и с пульсом хотя бы в одной неосложненной нижней конечности. Пациенты были исключены из исследования при наличии любого из следующих состояний:

- Заболевания периферических сосудов в анамнезе
- Аутоиммунные заболевания
- Известное нарушение кровотечения при тяжелой анемии
- INR >1,5
- Инфаркт миокарда в течение 72 часов
- Неконтролируемая гипертония, несмотря на лечение
- Ожирение, исключающее доступ с помощью техники Сельдингера
- Наличие сосудистого имплантата или стента в месте артериотомии
- Предыдущая ипсилатеральная пункция в течение 3 месяцев
- Ожидаемая продолжительность жизни < 6 месяцев

Кроме того, пациенты исследовались во время операции и исключались из исследования при наличии любого из следующих признаков:

- Диаметр просвета общей бедренной артерии <5 мм
- Артериальные ветви в пределах 2 см проксимальнее места пункции
- Сильный стеноз в пределах 3 см от места пункции
- Использование первичного интродьюсера >6Fr
- Пункция в области бифуркации бедра или дистальнее нее

- Многократные пункции бедра
- Известная или подозреваемая пункция задней стенки бедренной артерии
- Большая гематома (2:6 см) после завершения процедуры
- Сложное введение первичного интродьюсера для процедуры из-за извилистой ткани или сосуда

Данное исследование с использованием одного протокола проводилось в двух частях: В первую часть было включено 20 пациентов, затем был проведен анализ безопасности, а во вторую часть было включено еще 60 пациентов.

В части 1 средний возраст зарегистрированных пациентов составил 65,9 года, 70,0 % пациентов были мужчинами, а 95 % пациентов принимали сопутствующие лекарства. Во второй части исследования средний возраст составлял 63,8 года, 78 % были мужчинами, а 100 % принимали сопутствующие лекарства.

Пациенты, которым проводили диагностические (часть 1 и часть 2) или интервенционные (часть 2) процедуры катетеризации сердца, имели право на участие в исследовании.

Процедуры соответствовали стандарту ухода в каждой из регистрирующих больниц с последующим использованием системы FemoSeal™ VCS. Данные о пациенте собирали на исходном уровне, во время процедуры и через 1 день и 30 дней после процедуры.

Результаты представлены в **таблице 1.5** и указывают на то, что система FemoSeal™ VCS безопасна и эффективна для использования в данной популяции пациентов.

| Среднее время до гемостаза                                                                                            | 1,2 минуты     | 1,6 минуты <sup>a</sup>  |
| Среднее время до восстановления способности передвигаться                                                             | 72,2 минуты    | 87,5 минуты <sup>b</sup> |
| Распространенность основных сосудистых осложнений <sup>c</sup>                                                        | 0 (0 %)        | 1 (2 %)                  |
| Число пациентов с нежелательными явлениями                                                                            | 5 (25 %)       | 19 (32 %)                |
| Неудачное лечение (определяется как серьезные сосудистые осложнения, необходимость ручного сжатия или и то, и другое) | 0 (0 %)        | 3 (5 %)                  |
| Неисправности устройства                                                                                              | 0 (0 %)        | 6 (10 %)                 |

<sup>a</sup> На основании общего размера выборки 58, поскольку 2 больных не достигли гемостаза во время процедуры из-за предыдущих ипсилатеральных пункций. Гемостаз был достигнут через 7 минут и 37 минут для этих пациентов.

<sup>b</sup> На основании общего размера выборки 59: один пациент не был включен в исследование, поскольку его поместили на аппарат ИВЛ из-за отека легких и не мог передвигаться более недели.

<sup>c</sup> Определяется как сосудистое осложнение, требующее переливания крови или хирургического восстановления, или местное инфицирование, требующее введения антибиотика, госпитализации или продления госпитализации, или санации участка

В части 1 исследования не наблюдалось серьезных сосудистых осложнений. В части 2 исследования отмечено одно серьезное сосудистое осложнение: псевдоаневризма, о которой сообщалось в течение одного дня после процедуры. В результате потребовались сжатие под ультразвуковым контролем и инъекция тромбина в псевдоаневризму, а также продление госпитализации пациента.

Из пяти нежелательных явлений, отмеченных в части 1 исследования, было одно, возможно, связанное с устройством нежелательное явление: несерьезное событие, связанное с острым кровотечением, через 1 день после процедуры. Из 19 нежелательных

явлений, отмеченных в части 2 исследования, были отмечены три связанных с устройством несерьезных нежелательных явления гематомы, а также шесть возможных несерьезных явлений, связанных с устройством, включая три сообщения о постоянном просачивании, две гематомы и один случай боли в ногах после упражнения.

В части 2 три пациента считались получившими неудачное лечение: двое из-за неудачного достижения гемостаза без применения сжатия и один — из-за серьезного сосудистого осложнения (псевдоаневризмы). В части 1 исследования не было случаев неудачного лечения.

Из шести неполадок устройства, выявленных в части 2 исследования, три не препятствовали проведению процедуры. Одна из них была вызвана ошибкой пользователя, одна – протечкой интродьюсера, а другая – поломкой сочленения многоволоконной нити. Последние две проблемы были решены с помощью обновлений модели, реализованных в C11202.

Часть 2 предпродажного клинического исследования не сообщала о результатах последующего контроля через 6 месяцев из-за несоблюдения пациентом требований. Результаты предпродажного клинического исследования (EU-SE-001) за 30 дней, которые соответствуют срокам наблюдения в клинической литературе, свидетельствуют о безопасности и эффективности системы FemoSeal™ VCS.

### 1.4.2 Сводные данные послепродажных клинических исследований

В **таблице 1.6** ниже приведены четыре завершенных послепродажных клинических исследования. Эти клинические исследования не опубликованы и недоступны в Интернете.

**Таблица 1.6. Послепродажные клинические исследования**

|--|--|--|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Исследование 2006 года было проведено для подтверждения безопасности и эффективности текущего устройства с усовершенствованной системой доставки и для получения обратной связи по инструкции по применению FemoSeal™ VCS и учебной программе. Исследование включало 100 пациентов, и основной конечной точкой было достижение гемостаза или необходимость дополнительного ручного или механического сжатия. В ходе данного исследования было сделано заключение о том, что применение системы VCS FemoSeal™ было успешным в большинстве случаев (91 % достигли мгновенного гемостаза).

В исследовании 2008 года приняли участие 50 пациентов для оценки безопасности и эффективности системы VCS FemoSeal™ при ее использовании во время обычных клинических процедур у пациентов, которым проводилась катетеризация сердца с использованием интродьюсера калибра 7 Fr. Основной конечной точкой исследования был сбор данных о времени до гемостаза и времени до восстановления передвижения без дополнительного сжатия, ручного или механического. Результаты исследования показали,

что среднее время до достижения гемостаза составило 57,8 секунды, и все пациенты ходили после 4 часов постельного режима.

Исследование 2009 года было посвящено оценке новой упаковки FemoSeal™ VCS. В исследовании приняли участие 25 пациентов. Первичной конечной точкой было то, испытывал ли пользователь какие-либо проблемы с упаковкой. Пользователи не замечали никаких проблем с новой упаковкой FemoSeal™ VCS. В ходе этого исследования также собирались данные о времени до гемостаза.

Целью исследования 2022 г. был проактивный сбор данных о безопасности и эффективности FemoSeal VCS при достижении гемостаза в месте доступа к общей бедренной артерии (CFA) у реальных пациентов, проходящих чрескожные эндоваскулярные процедуры. В исследовании приняли участие 230 пациентов. Основными конечными точками для регистрации являются успешное выполнение процедуры (т. е. удачный гемостаз в месте пункции) и уменьшение серьезных осложнений (например, повреждение сосудов, кровотечение, связанное с местом доступа, инфицирование места доступа, повторное ручное сжатие и ипсилатеральная острая ишемия ног, связанная с новым местом доступа). Исследование показало, что система FemoSeal™ VCS хорошо работает в реальных условиях и обеспечивает эффективный гемостаз и низкий уровень осложнений в месте доступа у пациентов, проходящих периферические эндоваскулярные вмешательства. Он демонстрирует хорошие эксплуатационные характеристики с коротким временем до гемостаза и хорошими отзывами операторов о практической применимости, что делает FemoSeal VCS ценным устройством для закрытия бедренного доступа.

### **1.4.3 Сводные данные послепродажного клинического контроля**

#### **1.4.3.1 Завершенный послепродажный клинический контроль**

Сводная информация о выполненных мероприятиях по послепродажному клиническому контролю приведена в **таблице 1.7** ниже.

**Таблица 1.7. Послепродажный клинический контроль**

| Завершенные мероприятия по послепродажному клиническому контролю          |                                   |                                                                    |                                                                                                                                                                                                     |                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

В течение текущего отчетного периода (01 сентября 2019 г. - 31 августа 2024 г.) компания Terumo Medical Corporation провела три высококачественных опроса врачей-пользователей.

В ходе клинических исследований FemoSeal™ были собраны проактивные клинические данные о безопасности и эффективности системы FemoSeal™ VCS во время клинического использования. Опрос включал вопросы, касающиеся всего устройства и сопутствующих принадлежностей, включая проводник 0,038 дюйма, а также их непосредственного взаимодействия. В ходе клинических исследований с использованием проводника диаметром 0,038 дюйма, поставляемого с системой FemoSeal™ VCS, были собраны проактивные клинические данные, связанные с безопасностью и эффективностью использования проводника. В ходе опроса основное внимание уделялось общему использованию проводника, начиная с введения через процедурный интродьюсер в сосудистую сеть и заканчивая извлечением проводника.

FemoSeal™ VCS и проводник 0,038 дюйма, входящие в комплект поставки устройства, получили приемлемые оценки; было подано 6 (шесть) жалоб на устройство и 9 (девять) претензий к проводнику на основании оценки комментариев, полученных в ходе высококачественных клинических исследований. Жалобы были оценены как для FemoSeal, так и для проводника, и рассмотрены в рамках процесса послепродажного наблюдения Terumo. Новые риски и/или уровни риска не определены.

Опрос врачей-пользователей был проведен в 2024 году в рамках мероприятий PMCF. Результаты опроса показали, что эффективность и безопасность системы FemoSeal™ VCS в целом оказались очень благоприятными. Также была продемонстрирована совместимость с проводниками, отличными от стандартных проводников, поставляемых с FemoSeal™ VCS.

#### **1.4.3.2 Текущий или запланированный послепродажный клинический контроль**

TMC один раз проводит текущий/планируемый послепродажный клинический контроль. Будет проведен клинический опрос с целью сбора обратной связи, связанной с использованием проводника с системой FemoSeal VCS распространяемой на рынке ЕС. Врачам предстоит заполнить анкету, чтобы узнать, какие проводники они использовали во время процедуры. Целью данного опроса является устранение пробела, выявленного как недостаток литературы и комментариев внешних экспертов по совместимости FemoSeal™ VCS с использованием проводников других производителей, не относящихся к компании Terumo. Обратная связь включает в себя технические результаты, клинические характеристики и безопасность, относящиеся к работе устройства с различными проводниками.

#### 1.4.4 Сводные данные из систематического обзора литературы

Компания Terumo Medical Corporation проводит систематические обзоры литературы для сбора и оценки клинических данных по безопасности и эффективности, полученных в ходе опубликованных исследований устройства FemoSeal™ VCS и/или аналогичных устройств. Цель ежегодного анализа опубликованной литературы заключается в выявлении ранее неизвестных побочных эффектов, отслеживании известных побочных эффектов, определение возникающих рисков, а также выявлении возможного систематического неправильного или не предусмотренного инструкцией использования устройства FemoSeal™ VCS.

В последнем систематическом обзоре литературы, охватывающем период с 1 сентября 2019 г. по 31 августа 2024 г., было выявлено 29 опубликованных исследований, в которых были получены данные о клинической безопасности и эксплуатационных характеристиках устройства FemoSeal™ VCS. В 23 исследованиях сообщалось о применении FemoSeal™ VCS по инструкции, а о применении не по инструкции сообщалось в девяти исследованиях. В целом, обзор литературы по исследованиям, характерным для использования FemoSeal™ VCS, показывает исследуемую популяцию, которая является репрезентативной для пациентов в ЕС, проходящих чрескожную сосудистую катетеризацию. Список 23 рецензируемых публикаций касательно исследований по одобренным показаниям с отзывами коллег см. в разделе 3.

Клинические показатели оценивались по следующим показателям:

- Время до гемостаза лучше или сопоставимо с уровнем современного состояния технологии чрескожного закрытия общей бедренной артерии.
- Время до восстановления способности передвигаться лучше или сравнимо с уровнем современного состояния технологии чрескожного закрытия общей бедренной артерии.
- Частота послеоперационных осложнений сопоставима или ниже, чем текущие стандарты лечения.

На основании этих клинических показателей данные, представленные в данной обзорной литературе, показали, что FemoSeal™ VCS можно успешно использовать для закрытия пункции бедренной артерии (артериотомии) у пациентов, которым проводилась чрескожная катетеризация с использованием процедурного интродьюсера размером 7 Fr или меньше. Полный гемостаз был достигнут у большинства пациентов (79,65-100 %) и был связан с медианой времени до гемостаза 0,5 мин, среднее время до выписки — 3 дня. От 69,2 до 86,7 % пациентов могли передвигаться через 5 часов после закрытия раны, со средним послеоперационным постельным режимом 349 минут. Неисправность системы FemoSeal™ VCS наблюдалась в 3,68-4 % случаев, а дополнительное ручное сжатие потребовалось в 0,9-4,4 % случаев.

Клиническая безопасность оценивалась по неблагоприятным явлениям, включая, помимо прочего, такие как:

- Кровотечение
- Гематома
- Псевдоаневризма
- Синяк
- Артериовенозная фистула
- Инфекция
- Летальный исход

Для каждого из этих нежелательных явлений частота возникновения, отмеченная для FemoSeal™ VCS во включенных исследованиях, была меньше или сопоставима с ранее зарегистрированной частотой для ручного сжатия и других устройств для закрытия сосудов.

В ходе изучения 10 отчетов о клинических случаях не было выявлено никаких нежелательных явлений, поскольку не было выявлено новых, непредвиденных, возникающих или неприемлемых рисков.

Общая эффективность использования FemoSeal™ VCS во время диагностической ангиографии или интервенционных операций зависит от множества факторов, таких как пол, возраст, анатомия пациента, сопутствующие заболевания, анатомическое расположение места пункции, опыт хирурга, метод размещения VCD, послеоперационный уход, и т. д. В дополнение к техническому успеху, включая достижение гемостаза, система FemoSeal™ VCS предлагала клинические преимущества по сравнению с закрытием сосудов после пункции бедренной артерии, такие как сокращение времени до гемостаза, сокращение времени до восстановления способности передвигаться. Фактические результаты для исследуемых устройств соответствуют ожидаемым для данного типа устройств при условии использования по назначению. Некоторые из ссылок, полученных в течение текущего периода поиска, показали использование исследуемого устройства в анатомическом месте, отличном от общей бедренной артерии, и для закрытия артериотомии > 7 Fr, что считается нарушением инструкции по применению.

В ходе обзора не были выявлены неизвестные побочные эффекты, возникающие риски или возможное систематическое неправильное использование устройства. Тем не менее, если FemoSeal™ VCS используется с осторожностью подготовленными врачами, это медицинское изделие является полезным и необходимым клиническим изделием. В целом целевая терапия и, следовательно, система FemoSeal™ VCS удовлетворяют клиническим потребностям, существующим в настоящее время в лечении осложнений, которые связаны с сосудистым доступом.

В целом, данные, приведенные в настоящей литературе, не выявили каких-либо проблем с эффективностью или безопасностью в клинических условиях, которые ранее были неизвестны, или неблагоприятных эффектов, которые имели место с более высокой ожидаемой/допустимой частотой. Таким образом, из этой литературы можно сделать вывод о том, что система VCS FemoSeal™ при использовании для обеспечения сжатия с целью гемостаза при артериотомии после чрескожной катетеризации продолжает работать в соответствии с ожиданиями и не связана с серьезными событиями, связанными с безопасностью.

#### **1.4.5 Сводные данные послепродажных наблюдений**

Действует проактивная система PMS. Ежемесячно проводится анализ всех претензий в соответствии с внутренними производственными процедурами. Данные по жалобам проанализированы в период с 1 сентября 2019 г. по 31 августа 2024 г. В целом было представлено 28 отчетов по контролю медицинских изделий (MDV) и 476 отчетов о жалобах клиентов, представленных производителю. Из 28 сообщений о MDV 27 были связаны с нежелательными явлениями, одно — с неисправностью устройства. В течение отчетного периода было зарегистрировано два смертельных случая, но ни один из зарегистрированных смертельных исходов не был связан с исследуемым устройством. Из 476 жалоб, направленных производителю, наиболее частыми причинами жалоб были затруднения при разворачивании (146 случаев, частота 0,0142 %). Режим отказа при событиях извлечения устройства является вторым наиболее частым с частотой 0,0126 % (130 событий).

Продажи системы FemoSeal Vascular Closure System превышают 1 030 136 по всему миру и 827 833 в Европейской экономической зоне. Расчетная частота жалоб на основе глобальных продаж составляет 0,046 %. Общая частота поступления претензий клиентов очень низкая. Новые риски, не включенные в инструкцию по эксплуатации и документацию по рискам, не выявлены.

Частота возникновения нежелательных побочных эффектов приведена в **таблице 1.2**. В ходе рассмотрения претензий не было обнаружено новых непредвиденных, возникающих или неприемлемых рисков. Значительного увеличения частоты или тяжести известных нежелательных побочных эффектов не наблюдалось.

#### **1.4.6 Общие сводные данные о клинической эффективности и безопасности**

Система FemoSeal™ VCS показана к применению при закрытии общей бедренной артериальной пункции (артериотомии) у пациентов, которым проводилась чрескожная катетеризация с использованием процедурного интродьюсера размером 7F (2,33 мм) или меньше. Данная клиническая оценка основана на всестороннем анализе имеющихся до- и послепродажных клинических данных и литературы, относящейся к назначению устройства FemoSeal™ VCS.

Был проведен всесторонний обзор опубликованной литературы за период с 1 сентября 2019 г. по 31 августа 2024 г. Совокупность доказательств включала 29 исследований системы FemoSeal™ VCS. Доказательства, представленные в ходе клинической оценки, позволяют сделать вывод о том, что исследуемое устройство безопасно и эффективно при использовании по назначению, а любые риски или нежелательные побочные эффекты, которые могут быть связаны с устройством в нормальных условиях использования, представляют собой приемлемые риски в сравнении с преимуществами для пациента. Фактические результаты для исследуемых устройств соответствуют ожидаемым для данного типа устройств при условии использования по назначению.

К возможным нежелательным побочным эффектам, связанным с использованием FemoSeal™ VCS, относятся нежелательные явления, о которых обычно сообщают при альтернативных способах закрытия артериотомии, например кровотечение и гематома. В целом, частота возникновения нежелательных явлений, о которых сообщалось при использовании FemoSeal™ VCS, аналогична частотам, о которых сообщалось при ручном сжатии и использовании аналогичных устройств для закрытия сосудов. В частности, частоты возникновения кровотечения и гематомы, зарегистрированные для FemoSeal™ VCS, ниже, чем для аналогичных устройств для закрытия сосудов. Каждое из зарегистрированных нежелательных явлений, как из опубликованной литературы, так и из послепродажного наблюдения, было ранее выявлено (см. **раздел 1.3**).

Имеющиеся данные о клинической безопасности и эксплуатационных характеристиках свидетельствуют о том, что использование устройства FemoSeal™ VCS дает пациенту преимущество, перевешивая возможные риски при его использовании в соответствии с инструкцией по применению.

Как указано в предыдущих разделах выше, данные, предоставленные для FemoSeal™ VIP VCD, демонстрируют согласованность между данными, относящимися к оцениваемому устройству (например, использование устройства, показатели безопасности, клинические характеристики и клинические преимущества), идентифицированными эквивалентными устройствами и данными, относящимися к аналогичным устройствам, перечисленным в разделе «Современное состояние вопроса».

Перекрестный анализ данных по безопасности не выявил каких-либо различий между:

- данными, упомянутыми в разделе «Современное состояние вопроса»
- данными, специфическими для оцениваемого устройства
- данными, указанными в файле (файлах) управления рисками
- данными, указанными в маркировке и/или IFU (т.е. рассматриваются остаточные риски, которые должны быть доведены до сведения пользователя).

Клиническая безопасность подтверждается низким уровнем осложнений, выявленных в опубликованной рецензируемой клинической литературе, клинических исследованиях, спонсируемых компанией, обзором послепродажных данных, а также отсутствием отзыва продукта с рынка. Не было выявлено каких-либо проблем с производительностью, в изученной литературе описано использование испытываемого устройства FemoSeal™ VCS в соответствии с заявленным производителем назначением.

### **1.5 Возможные диагностические и терапевтические альтернативы**

Ручное сжатие традиционно используется для достижения гемостаза в месте артериотомии после катетеризации сосудов. Ручное сжатие сопряжено с длительной иммобилизацией пациента (до 8 часов после процедуры) а также со значительным дискомфортом и длительным пребыванием в больнице. В недавнем систематическом обзоре было обнаружено, что медианное время достижения гемостаза с ручным сжатием составляло 20,8 минуты.

Альтернативы ручному сжатию включают внешние гемостатические устройства, которые прилагают механическое сжатие к месту артериотомии. Эти устройства не сокращают время до гемостаза или восстановления способности передвигаться, а снижают потребности в персонале, заменяя ручное сжатие механическим. Частота нежелательных явлений, связанных с использованием механического сжатия, аналогична таковой при ручном сжатии.

Устройства для закрытия сосудов, такие как FemoSeal™ VCS, предназначены для закрытия артериотомии. Они направлены на сокращение времени до гемостаза и обеспечение более ранней способности передвигаться. В недавнем систематическом обзоре, включающем 13 коммерчески доступных устройств, было обнаружено, что медианное время достижения гемостаза с помощью устройства для закрытия сосудов составляло 5,4 минуты.

Медианное время гемостаза для отдельных устройств для закрытия сосудов составляло от 1 минуты (FemoSeal™ VCS) до 14 минут; при этом для большинства устройств это время составляло от 4 до 10 минут.<sup>1</sup>

Обычно сообщаемые нежелательные явления, связанные с закрытием участка артериотомии, при ручном сжатии, использовании внешних гемостатических устройств или устройств для закрытия сосудов, включают гематому, кровотечение в месте доступа, псевдоаневризму, артериовенозную фистулу и инфекцию. Такой же систематический обзор (34 рандомизированных контролируемых исследования, 14 401 пациент) показал, что частота нежелательных явлений между ручным сжатием и использованием устройств для закрытия сосудов была одинаковой, за исключением того, что при закрытии сосудов с использованием устройств кровотечение, как правило, было немного выше.

## 1.6 Предлагаемый профиль пользователя и обучение

Предполагаемыми пользователями FemoSeal™ Vascular Closure System являются врачи, прошедшие обучение и имеющие квалификацию для выполнения артериального доступа и закрытия при эндоваскулярных процедурах с использованием общей бедренной артерии, и принявшие участие в программе обучения врачей Terumo Medical Corporation FemoSeal™.

Tento súhrn parametrov bezpečnosti a klinického výkonu (SSCP) je určený na to, aby poskytol verejný prístup k aktualizovanému súhrnu údajov o bezpečnosti a klinickej účinnosti cievneho uzatváracieho systému FemoSeal™ Vascular Closure System (VCS).

Súhrn parametrov bezpečnosti a klinického výkonu pomôcky určený pre používateľov/zdravotníckych pracovníkov je uvedený nižšie v **časti 1.0**.

## **1.0 SÚHRN PRE POUŽÍVATEĽOV/ZDRAVOTNÍCKYCH PRACOVNÍKOV**

SSCP nemá nahradiť návod na použitie, ktorý je hlavným dokumentom na zaistenie bezpečného používania pomôcky, ani nie je určený na poskytovanie diagnostických alebo terapeutických návrhov určeným používateľom alebo pacientom. SSCP tiež nenahrádza povinné informácie na kartách implantátov ani na akýchkoľvek iných povinných dokumentoch.

### **1.1 Určené použitie pomôcky**

#### **1.1.1 Určené použitie**

Cievny uzatvárací systém FemoSeal™ Vascular Closure System je zdravotnícka pomôcka určená na uzavretie arteriálnej punkcie po perkutánnej katetrizácii cez spoločnú femorálnu artériu.

#### **1.1.2 Indikácie na použitie**

Cievny uzatvárací systém FemoSeal™ Vascular Closure System je indikovaný na použitie pri uzatvorení bežnej femorálnej arteriálnej punkcie (arteriotómie) u pacientov, ktorí podstúpili perkutánnu katetrizáciu pomocou 7F (2,33 mm) alebo menšieho procedurálneho zavádzača.

#### **1.1.3 Kontraindikácie a/alebo obmedzenia**

Cievny uzatvárací systém FemoSeal™ Vascular Closure System je kontraindikovaný u pacientov s arteriotómiami, u ktorých sa používali zavádzače alebo pomôcky väčšie ako 7F (2,33 mm).

#### **1.1.4 Cieľová skupina používateľov**

Bezpečnosť a účinnosť cievneho uzatváracieho systému FemoSeal™ Vascular Closure System bola stanovená u pacientov vo veku 18 rokov a starších, ktorí podstúpili perkutánnu katetrizáciu pomocou 7F (2,33 mm) alebo menšieho procedurálneho zavádzača.

#### **1.1.5 Osobitné skupiny pacientov**

Bezpečnosť a účinnosť cievneho uzatváracieho systému FemoSeal™ Vascular Closure System nebola stanovená u nasledujúcich skupín pacientov:

- pacienti s existujúcim autoimunitným ochorením,
- pacienti podstupujúci terapeutickú trombolýzu,
- pacienti s klinicky významným ochorením periférnych ciev,
- pacienti s nekontrolovanou hypertenziou (> 220 mmHg systolický alebo > 110 mmHg diastolický tlak),
- pacienti s poruchou krvácania vrátane trombocytopenie (< 100 000 počet trombocytov) alebo anémie (Hgb < 10 mg/dl),

- pacienti s vnútorným lúmenom spoločnej femorálnej artérie menším ako 5 mm,
- pacienti s poruchou funkcie obličiek a/alebo pečene,
- pacienti s inou relevantnou komorbiditou,
- populácia so špecifickým rasovým a/alebo etnickým pôvodom,
- pacienti s infarktom myokardu v priebehu 72 hodín,
- pacienti s cievnyňm štepom alebo stentom v mieste vpichu,
- tehotné alebo dojčiacie ženy,
- pacienti vo veku do 18 rokov.

### 1.1.6 Určení používateľa

Určeními používateľmi cievneho uzatváracieho systému FemoSeal™ Vascular Closure System sú lekári vyškolení na vykonávanie arteriálneho prístupu a uzatváranie endovaskulárnych zákrokov prostredníctvom spoločnej femorálnej artérie a zúčastnili sa školenia lekárov o používaní pomôcky FemoSeal™ od spoločnosti Terumo Medical Corporation.

## 1.2 Opis pomôcky

### 1.2.1 Opis pomôcky

Cievny uzatvárací systém FemoSeal™ Vascular Closure System, ktorý vyrába spoločnosť Terumo Medical Corporation (TMC), je vstrebateľná pomôcka na uzatváranie ciev určená na dosiahnutie arteriálnej hemostázy po perkutánnej katetrizácii pomocou spoločnej femorálnej artérie.

Uzatváracie prvky FemoSeal™ pozostávajú z dvoch vstrebateľných polymérových diskov, vnútorného uzáveru a vonkajšieho uzamykacieho disku, ktoré sú navzájom spojené vstrebateľným polyfilom, čím mechanicky uzatvárajú arteriotómiu (pozri **obrázok 1.1** a **obrázok 1.2**). Po zavedení cez zavádzač s kužeľovým puzdrom je vonkajší uzamykací disk nasadený na teleso polyfilu, čo vedie k mechanickému uzavretiu miesta vpichu medzi vnútorným a vonkajším uzamykacím diskom. Vnútorný uzáver a vonkajší uzamykací disk sú fixované trením na telese polyfilu. Hemostáza sa dosahuje mechanickými prostriedkami. Uzatváracie prvky sa rozkladajú hydrolýzou.

Implantovateľné uzatváracie komponenty, vnútorný uzáver a vonkajší uzamykací disk sa rozložia za osemnásť (18) mesiacov, pričom polyfil sa rozloží a absorbuje prostredníctvom hydrolýzy okolitým tkanivom po približne dvoch (2) až troch (3) rokoch. Schopnosť implantovateľných uzatváracích komponentov udržiavať kompresiu na arteriotómii bola testovaná až osem (8) hodín.

Produkty rozkladu sa metabolizujú a vylučujú v moči alebo sa vylúčia ako oxid uhličitý cez pľúca. v štúdiách na zvieratách neboli pozorované žiadne akumulčné účinky. Ďalšie komponenty pomôcky FemoSeal™, ktoré sa počas zákroku dostanú do kontaktu s tkanivom alebo krvou, sú zavádzač s kužeľovým puzdrom, dilatátor, zatláčacia hadička, zatláčací piest a vodiaci drôt.

**Obrázok 1.1 Vnútrotný uzáver a vonkajší uzamykací disk**

**Obrázok 1.2 Zavedený vnútrotný uzáver a vonkajší uzamykací disk**

Jednotka FemoSeal™ je balená spolu s dilatátorom a vodiacim drôtom s vonkajším priemerom 0,038" (0,97 mm) a dĺžkou 27,5" (70 cm) a vyrovnávačom „J“, pozri **obrázok 1.3** nižšie.

Vodiaci drôt sa nachádza vo vnútri polyetylénovej hadičky. Všetky časti sú zabalené na pevnom papierovom podklade. Balenie obsahuje aj kartu implantátu pacienta. Cievny uzatvárací systém FemoSeal™ Vascular Closure System na riadne fungovanie nevyžaduje ďalšie príslušenstvo, pričom táto pomôcka je určená len na použitie s dilatátorom a vodiacim drôtom, ktorý je súčasťou balenia produktu.

**Obrázok 1.3 Jednotka FemoSeal™ VCS s vodiacim drôtom a dilatátorom**

### 1.2.2 Suroviny a komponenty

V tabuľke 1.1 nižšie sú uvedené komponenty pomôcky FemoSeal™ VCS.

**Tabuľka 1.1 Materiály a komponenty pomôcky FemoSeal™ VCS**

| Číslo dielu | Opis                                                                               |                                                            | Materiál                                                                                                                                                                                               |

\* Implantovateľná časť pomôcky; implantovateľné komponenty sú bezpečné pri použití v prostredí MRI

FemoSeal™ VCS sa sterilizuje pomocou etylénoxidu (EO) a je to jednorazová zdravotnícka pomôcka. Pomôcka FemoSeal™ VCS je navrhnutá tak, aby sa nedala opätovne použiť.

### **Spôsob fungovania**

FemoSeal™ VCS podporuje mechanickú hemostázu nasadením implantovateľných uzatváracích prvkov vo vnútri a mimo spoločnej femorálnej artérie. Mechanizmus zabraňujúci krvácaniu je zabezpečený vnútorným uzáverom, ktoré utesňuje miesto vpichu, a vonkajším uzamykacím diskom, ktorý udržiava vnútorné tesnenie na mieste.

### **1.2.3 Klinický prínos**

FemoSeal™ VCS poskytuje nasledujúce klinické prínosy vo vzťahu k vaskulárnemu uzáveru po punkcii spoločnej femorálnej artérie:

- Skrátene čas do hemostázy<sup>1</sup>
- Skrátene čas do ambulácie<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Predchádzajúca(-e) generácia(-e) alebo varianty

- Prvá verzia pomôcky FemoSeal™ VCS (č. 11200) sa na európskom trhu predávala v roku 2005 a sčasti v roku 2006.
- Súčasný systém FemoSeal™ VCS (č. 11202) s vylepšeným zavádzacím systémom je na trhu od 28. marca 2006.

#### 1.2.5 Príslušenstvo určené na použitie v kombinácii s pomôckou

Jednotka FemoSeal™ je balená spolu s dilatátorom a 0,038" (0,97 mm) OD, vodiacim drôtom s dĺžkou 27,5" (70 cm) a vyrovnávačom „J“. Vodiaci drôt je príslušenstvom k jednotke FemoSeal™. Vyrovnávač „J“ je súčasťou vodiaceho drôtu, zatiaľ čo dilatátor je súčasťou jednotky FemoSeal™. Vodiaci drôt je jediným uvažovaným príslušenstvom. Vodiaci drôt sa nachádza vo vnútri polyetylénovej hadičky. Všetky časti sú zabalené na pevnom papierovom podklade. Balenie obsahuje aj kartu implantátu pacienta. Cievny uzatvárací systém FemoSeal™ Vascular Closure System na riadne fungovanie nevyžaduje ďalšie príslušenstvo, pričom táto pomôcka je určená len na použitie s dilatátorom a vodiacim drôtom, ktorý je súčasťou balenia produktu.

#### 1.2.6 Ďalšie pomôcky a výrobky určené na použitie v kombinácii s pomôckou

Pomôcka FemoSeal™ VCS nevyžaduje na riadne fungovanie ďalšie pomôcky.

### 1.3 Riziká a varovania

#### 1.3.1 Reziduálne riziká a nežiaduce účinky

Známe alebo predvídateľné nežiaduce udalosti, poškodenia a komplikácie spojené s používaním pomôcky FemoSeal™ VCS v dôsledku zvýšeného rizika sú uvedené v **tabuľke 1.2**. Miera výskytu je založená na analýze dokumentácie rizík a vypočítaná na základe údajov z dohľadu po uvedení na trh od 1. septembra 2019 do 31. augusta 2024. Pre pomôcku FemoSeal™ VCS neexistujú žiadne neznáme reziduálne riziká a všetky aplikovateľné riziká sa riešia v návode na použitie a procese riadenia rizík.

**Tabuľka 1.2. Nežiaduce udalosti/komplikácie spojené s pomôckou FemoSeal**

| Škodlivé následky                       | Miera výskytu (%) | Zmierňujúce faktory                                                                                                                                                                  |

### 1.3.2 Varovania a bezpečnostné opatrenia

#### Varovania

1. Nepoužívajte, ak je balenie poškodené, alebo v prípade, že sterilná bariéra je porušená.
2. Nepoužívajte po dátume expirácie – biologicky degradovateľné časti by mohli fungovať nesprávne.
3. Nepoužívajte, ak sa akákoľvek časť zdá byť poškodená alebo chybná.
4. Použitie cievneho uzatváracieho systému FemoSeal™ Vascular Closure System tam, kde by mohlo dôjsť k bakteriálnej kontaminácii procedurálneho zavádzача alebo okolitých tkanív, by mohlo spôsobiť vznik infekcie.
5. Ak je podozrenie, že bola prepichnutá zadná stena tepny, alebo bol vytvorený viac ako jeden vpich tepny, nespoliehajte sa výhradne na cievny uzatvárací systém FemoSeal™ Vascular Closure System, aby ste dosiahli arteriálnu hemostázu. Použite ďalšiu manuálnu alebo mechanickú kompresiu.
6. Ak je miesto vpichu na úrovni bifurkácie femorálnej artérie alebo distálne k nej, cievny uzatvárací systém FemoSeal™ Vascular Closure System by sa nemal používať v dôsledku rizika nesprávneho umiestnenia vnútorného uzáveru. Táto udalosť by mohla spôsobiť krvácané komplikácie a/alebo narušenie normálneho prietoku krvi.
7. Ak z miesta incízie pretrváva arteriálne krvácanie, neskracujte polyfil, až kým nebude dosiahnutá hemostáza. Ak nie je hemostáza dosiahnutá, utiahnite polyfil sterilným krytím na rany a aplikujte doplnkovú kompresiu až do dosiahnutia hemostázy. v prípade pretrvávajúceho arteriálneho krvácania sa môžu objaviť významné krvácané komplikácie, ktoré by mohli spôsobiť poranenie pacienta alebo jeho smrť.
8. Nepoužívajte cievny uzatvárací systém FemoSeal™ Vascular Closure System, ak je miesto vpichu proximálne k inguinálnemu väzu, pretože to môže spôsobiť retroperitoneálny hematóm.
9. Pacienti s vyšším rizikom krvácania môže dôjsť k zvýšenej strate krvi, ktorá si vyžaduje transfúziu.
10. Ak sa vnútorný disk oddelí, môže potenciálne spôsobiť trombotickú a/alebo embolickú príhodu.

#### Bezpečnostné opatrenia

1. Postup zavedenia cievneho uzatváracieho systému FemoSeal™ Vascular Closure System by mal byť uskutočnený iba lekármi adekvátne vyškolenými na použitie tejto pomôcky.
2. Pred zavedením cievneho uzatváracieho systému FemoSeal™ Vascular Closure System urobte čiastočný femorálny angiogram alebo ultrazvukovo riadenú femorálnu punkciu.

3. Prerušte zákrok ak:
  - Priemer lúmenu spoločnej femorálnej artérie < 5 mm.
  - Ste zaznamenali prítomnosť stenózy alebo významného plátu v blízkosti miesta vpichu spoločnej femorálnej artérie.
  - Arteriálna punkcia je na úrovni bifurkácie femorálnej artérie alebo distálne k nej.
  - V blízkosti miesta vpichu spoločnej femorálnej artérie sa nachádzajú anomálne vetvy alebo abnormality ciev.
4. Ak je prítomný akýkoľvek hematóm, je potrebné venovať zvláštnu opatrnosť pri zavádzaní zavádzača s kužeľovým puzdrom do artérie.
5. Používajte techniku punkcie jednej steny. Neprepichujte zadnú stenu artérie.
6. Pri používaní cievneho uzatváracieho systému FemoSeal™ Vascular Closure System vždy dodržiavajte sterilnú techniku.
7. Cievny uzatvárací systém FemoSeal™ Vascular Closure System je určený len na jedno použitie a nesmie sa resterilizovať alebo opakovane akýmkoľvek spôsobom používať. Jednotka FemoSeal™ je navrhnutá tak, aby sa nedala znova použiť.
8. Ak pri zavádzaní vnútorného uzáveru pocítite neočakávaný odpor, zákrok prerušte.
9. Pre správne nasadenie vnútorného uzáveru posuňte palec tak, aby tlačidlo mohlo voľne vyskočiť späť.
10. Pred zavedením vonkajšieho uzamykacieho disku skontrolujte, či je hrot zavádzača s kužeľovým puzdrom pomôcky FemoSeal™ pod povrchom kože. Vonkajší uzamykací disk môže byť nechtiac umiestnený nad povrch kože najmä u pacientov s malou vzdialenosťou medzi femorálnou artériou a povrchom kože.
11. Na správne zavedenie môže byť potrebná kožná incízia.
12. Ak je vnútorný uzáver v tepne, ale nie je možné celkom stlačiť tlačidlo a umiestniť vonkajší uzamykací disk, môže si odstránenie uzatváracích prvkov FemoSeal™ Vascular Closure System vyžadovať operáciu.
13. Ak bude potrebný opätovný vpich do tej istej femorálnej artérie v priebehu 18 mesiacov, mal by sa vykonať aspoň jeden centimeter proximálne k predchádzajúcemu prístupovému miestu pomôcky FemoSeal™ Vascular Closure System.
14. Poučte pacienta, aby postupoval podľa pokynov lekára týkajúcich sa kontroly miesta uzavretia.
15. Poučte pacienta, aby po dobu nasledujúcich 18 mesiacov nosil informačnú kartu pacienta.

### **Bezpečnostné opatrenia pri prepúšťaní**

Pred prepustením vyšetrite pacienta z hľadiska prítomnosti nasledujúcich klinických stavov:

1. Krvácanie a/alebo hematóm v mieste uzavretia.
2. Bolesť pri chôdzi.
3. Príznaky infekcie v mieste uzavretia.

### **1.3.3 Bezpečnostné nápravné opatrenia**

Počas obdobia od 1. septembra 2019 do 31. augusta 2024 došlo k jednému bezpečnostnému nápravnému opatreniu zahŕňajúcemu pomôcku FemoSeal™ VCS.

V roku 2022 spoločnosť Terumo dobrovoľne stiahla pomôcku FemoSeal™ VCS z dôvodu sťažností týkajúcich sa zlyhaní testovania procesu a uvoľnenia šarže výrobku FemoSeal vyrobenej spoločnosťou Elkton týkajúceho sa merania zatlačacej a retrakčnej sily. z Južnej Kórey bolo stiahnutých celkovo 950 kusov.

## **1.4 Klinické hodnotenie a klinické sledovanie po uvedení na trh**

**Tabuľka 1.3** obsahuje zoznam pivotných štúdií zahrnutých do uvedenia VCS FemoSeal™ na trh, ako aj štúdie po uvedení na trh a činnosti klinického sledovania po uvedení na trh. Verzia pomôcky použitá v štúdiu je uvedená v nasledujúcej tabuľke. Prvá verzia FemoSeal™ VCS (č. 11200) bola na trhu do roku 2006, ďalšia verzia (č. C11202), ktorá je v súčasnosti na trhu, bola uvedená v roku 2006.

#### 1.4.1 Zhrnutie údajov z testovania na zvieratách a klinických skúšaní pred uvedením na trh

V tabuľke 1.4 nižšie sú opísané všetky štúdie pred uvedením na trh, testovania na zvieratách aj klinické skúšania.

**Tabuľka 1.4 Zhrnutia štúdií pred uvedením na trh**

| Test funkčnosti na zvieratách pred uvedením na trh                                                                 |                                   |                                              |                                                                                                                          |                                                                                                           |                                                                                                                                                                               |

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002<br><br>Radi Medical System AB<br><br>Vykonané spoločnosťou Biomatech, Francúzsko | Štúdia na zvieratách | Cieľ štúdie bolo zhodnotenie biokompatibility a biofunkčnosti biologicky odbúrateľného implantátu určeného na dosiahnutie hemostázy v cievnom systéme. Skúšaná pomôcka bola určená na vstup do otvoru punkcie v artériách na dosiahnutie hemostázy. Jeden disk bol zavedený do otvoru punkcie v artérii a druhý utiahol vnútorný disk z vonkajšej strany artérie. Oba disky boli zavedené cez plášť závaždača. Tieto disky boli navrhnuté tak, aby zabráňovali krvácaniu, zahojili sa do steny cievy a nakoniec sa rozpadli a absorbovali. Štúdia bola navrhnutá tak, aby zhromažďovala a analyzovala údaje po funkčnej implantácii do oviec a ošípaných na vyhodnotenie kapacity implantátu zachovať fyziologické funkcie pri použití v obehovom | Obdobie implantácie/následné kontroly sú po 5 týždňoch pre všetky zvieratá<br><br>4 ovce, 1 ošípaná<br><br>14 uzatváracích prvkov<br><br>8 uzatváracích prvkov implantovaných 2 ovciam<br><br>2 uzatváracie prvky implantované 1 ošípanej<br><br>Ak boli dva uzatváracie prvky implantované do tej istej femorálnej artérie, boli implantované vo vzdialenosti > 30 mm | Zaznamenali sa všetky kritériá nežiaducich príznakov (zápal, nekróza, krvácanie alebo ťubovoľné iné lézie) alebo akékoľvek vytvorenie tenkej pseudointimálnej vrstvy. Osobitná pozornosť bola venovaná počiatočnej integrácii pomôcky s tkanivom so špeciálnym dôrazom na vnútornú enkapsuláciu disku.<br><br>Makroskopicky sa nepozorovali žiadne významné príznaky lokálnej intolerance ani tvorby trombov. Makroskopické pozorovanie neodhalilo po implantácii uzatváracích prvkov vo femorálnych artériách žiadny rozdiel medzi ovcami a ošípanou. Makroskopicky sa nepozorovali žiadne významné príznaky lokálnej intolerance ani tvorby trombov. Makroskopické |

|  |  |  | <p>systéme, na určenie reakcie hostiteľa a reakcie pomôcky (fyzická neporušenosť, enkapsulácia do tkaniva v čase utratenia) a na vyhodnotenie rozloženia implantátu</p> |  | <p>pozorovanie neodhalilo po implantácii uzatváracích prvkov vo femorálnych artériách žiadny rozdiel medzi ovcami a ošípanou.</p> <p>Histopatologická analýza miesta implantácie u oviec nepreukázala žiadne lokálne nežiaduce reakcie. Vnútorne a vonkajšie disky vykazovali známky rozkladu a v niektorých prípadoch sa rozpadli na menšie časti. Vnútorne disky boli úplne integrované do neointimálneho tkaniva. Histopatologická analýza u ošípanej preukázala okolo vnútorných a vonkajších diskov o niečo viac zápalových znakov. U oboch zvierat vykazoval polyfil mierne viac zápalových znakov ako materiál disku, čo je pri pletenom šití normálne z dôvodu väčšej plochy povrchu.</p> <p>Priechodnosť cievy sa merala po 5 týždňoch použitím troch rôznych metód, histomorfometrickej, histomorfometrickej v kombinácii s meraním priemeru cievy pomocou posuvného meradla a pomocou farebnej dopplerovej ultrasonografie. Priemerná priechodnosť cievy u oviec bola od 60 do 80 % v závislosti od metódy (12 pozorovaní). U ošípanej bola priemerná priechodnosť cievy</p> |

V rámci plánu vývoja pre FemoSeal™ VCS pred uvedením na trh boli vykonané 3 testy funkčnosti na zvieratách. v roku 2000 sa pred začatím klinických štúdií vykonala štúdia na zvieratách s cieľom posúdiť biologickú funkčnosť pomôcky FemoSeal™ VCS. Táto štúdia hodnotila schopnosť uzatváracích prvkov udržiavať fyziologickú funkciu a vyhodnotila ich rozkladanie. Po 18 mesiacoch už nebol viditeľný materiál vnútorného ani vonkajšieho disku a bol nahradený endoluminálnym fibróznym tkanivom. Na záver sa potvrdila schopnosť uzatváracieho prvku FemoSeal™ VCS zachovať fyziologickú funkciu pri použití v obehovom systéme.

V roku 2002 sa vykonala štúdia na zvieratách s cieľom posúdiť biokompatibilitu a biofunkčnosť biologicky odbúrateľného implantátu FemoSeal™ VCS, ktorý je určený na dosiahnutie hemostázy v cievnom systéme Zhrnutie: rozloženie implantátu bolo takmer dokončené do 36 týždňov a nedošlo k žiadnej významnej nežiaducej reakcii tkaniva.

Ďalšia štúdia na zvieratách v roku 2002 hodnotila biokompatibilitu a biofunkčnosť biologicky odbúrateľného implantátu FemoSeal™ VCS, ktorý je určený na dosiahnutie hemostázy v cievnom systéme. Po 5 týždňoch bola enkapsulácia disku dokončená a spozorovali sa známky rozloženia vnútorných a vonkajších diskov. Na záver sa potvrdila schopnosť implantátu zachovať fyziologickú funkciu pri použití v obehovom systéme.

V rámci plánu klinického vývoja pre pomôcku FemoSeal™ VCS vykonala spoločnosť Radi Medical System AB klinické skúšanie pred uvedením na trh. Toto klinické skúšanie nie je zverejnené ani dostupné online. Štúdia s modelom zariadenia č. 11200 sa vykonala v roku 2002-2004 v súlade s európskou normou EN 540 (Klinické skúšanie zdravotníckych pomôcok na humánne použitie) a v súlade s usmerneniami ICH Všeobecné úvahy pre klinické skúšky a Usmerneniami pre správnu klinickú prax. Podrobnosti tejto štúdie sú zdokumentované v správe EU-SE-001. Klinické skúšanie bolo zdokumentované v záverečnej správe od spoločnosti Radi Medical Systems AB, „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures“.

Klinická štúdia bola vykonaná s prvým modelom pomôcky FemoSeal™ č. 11200 so zameraním na bezpečnosť a účinnosť implantovateľných uzatváracích komponentov. Jediný rozdiel medzi prvým modelom č. 11200 a aktuálnym modelom C11202 je francúzska veľkosť 6F a 7F a vylepšený zavádzací systém. Klinické prínosy, určené použitie, princípy fungovania a suroviny implantovateľných uzatváracích prvkov, vnútorného uzáveru a vonkajšieho uzamykacieho disku zostávajú nezmenené.

Určené použitie tejto pomôcky bolo u pacientov podstupujúcich diagnostické kardiologické alebo intervenčné kardiologické zákroky s použitím femorálnej artérie ako prístupového bodu. Cieľom tejto štúdie bolo stanoviť bezpečnosť, výkonnosť a účinnosť pomôcky FemoSeal™ VCS. Bola to prospektívna, multicentrická, jednoskupinová, otvorená štúdia s následnou kontrolou po 30 dňoch.

Primárnym koncovým ukazovateľom výkonnosti bol čas na dosiahnutie hemostázy definovaný ako neprítomnosť rýchleho krvácania. Primárnym ukazovateľom bezpečnosti bol výskyt závažných vaskulárnych komplikácií počas 30 dní. Sekundárne koncové ukazovatele zahŕňali čas do ambulácie, pomer zlyhaní liečby, výskyt nežiaducich udalostí a výkonové charakteristiky pomôcky počas zavedenia a používania.

Pacienti zahrnutí do tejto štúdie boli dospelí, schopní poskytnúť informovaný súhlas a mali aspoň jeden neporušený pedálny pulz. Pacienti boli vylúčení zo štúdie, ak sa u nich vyskytol niektorý z nasledujúcich stavov:

- Periférne cievne ochorenie v anamnéze
- Autoimunitné ochorenie
- Známe poruchy krvácania s ťažkou anémiou
- INR >1,5
- Infarkt myokardu v priebehu 72 hodín
- Nekontrolovaná hypertenzia napriek liečbe
- Obezita brániaca prístupu pomocou Seldingerovej techniky
- Prítomnosť vaskulárneho štepu alebo stentu v mieste arteriotómie
- Predchádzajúca ipsilaterálna punkcia do 3 mesiacov
- Očakávaná životnosť < 6 mesiacov

Okrem toho boli pacienti počas operácie vyšetrení a vylúčení zo štúdie, ak bolo pozorované jedno z nasledujúcich:

- Priemer lúmenu spoločnej femorálnej artérie < 5 mm
- Arteriálne vetvy do 2 cm proximálne od miesta vpichu

- Závažná stenóza do 3 cm od miesta vpichu
- Použitie primárneho zavádzacieho puzdra > 6 Fr
- Miesto vpichu je na úrovni bifurkácie femorálnej artérie alebo distálne k nej
- Viaceré femorálne punkcie
- Potvrdené alebo predpokladané prepichnutie zadnej femorálnej steny
- Veľký hematóm (2:6 cm) po dokončení zákroku
- Ťažké zavedenie primárneho puzdra pre zákrok z dôvodu torzného tkaniva alebo cievy

Táto štúdia s jedným protokolom bola vykonaná v dvoch častiach: v 1. časti bolo zaradených 20 pacientov, potom sa vykonala bezpečnostná analýza a počas 2. časti sa zaregistrovalo ďalších 60 pacientov.

V 1. časti bol stredný vek zaradených pacientov 65,9 rokov, 70,0 % pacientov bolo mužov a 95 % pacientov malo súbežne podávané lieky. v 2. časti štúdie bol stredný vek 63,8 roka, 78 % boli muži a 100 % malo súbežne podávané lieky.

Na zaradenie do štúdie spĺňali podmienky pacienti podstupujúci diagnostické (časť 1 a časť 2) alebo intervenčné (časť 2) katetrizačné zákroky na srdci. Tieto postupy boli v súlade so štandardom starostlivosti v každej z registrovaných nemocníc, po ktorej nasledovalo použitie pomôcky FemoSeal™ VCS. Údaje o pacientovi boli zhromaždené na začiatku štúdie, počas zákroku a 1 deň a 30 dní po zákroku. Výsledky sú zhrnuté v **tabuľke 1.5** a naznačujú, že systém FemoSeal™ VCS je bezpečný a účinný na použitie v tejto populácii pacientov.

**Tabuľka 1.5 Klinické výsledky hlásené v štúdiu pred uvedením na trh**

| Počet pacientov s nežiaducimi udalosťami                                                              | 5 (25 %)    | 19 (32 %)             |
| Zlyhanie liečby (definované ako závažné vaskulárne komplikácie, nutnosť ručnej kompresie alebo oboje) | 0 (0 %)     | 3 (5 %)               |
| Poruchy pomôcky                                                                                       | 0 (0 %)     | 6 až (10 %)           |

<sup>a</sup> Na základe celkovej veľkosti vzorky 58, pretože 2 pacienti nedosiahli hemostázu v čase zákroku z dôvodu predchádzajúcej ipsilaterálnej punkcie. Hemostáza sa dosiahla po 7 minútach a 37 minútach u týchto pacientov.

<sup>b</sup> Na základe celkovej veľkosti vzorky 59: 1 pacient nebol zahrnutý, pretože bol umiestnený na ventilátor z dôvodu pľúcneho edému a nebol schopný ambuloval viac ako týždeň.

<sup>c</sup> Definované ako vaskulárna komplikácia vyžadujúca transfúziu krvi alebo chirurgický opravný zákrok alebo lokálna infekcia vyžadujúca podávanie antibiotík, hospitalizáciu alebo predĺženie hospitalizácie alebo odstránenie cudzích telies z miesta vpichu

V 1. časti štúdie sa nepozorovali žiadne závažné vaskulárne komplikácie. v 2. časti štúdie bola hlásená 1 závažná vaskulárna komplikácia: pseudoaneuryzma, ktorá bola hlásená do 1 dňa po zákroku. Udalosť vyžadovala kompresiu pod ultrazvukovou kontrolou a injekciu trombínu do pseudoaneuryzmy a predĺžila hospitalizáciu pacienta.

Z 5 nežiaducich udalostí hlásených v 1. časti štúdie sa vyskytla 1 nežiaduca udalosť potenciálne súvisiaca s pomôckou: nezávažná udalosť rýchleho krvácania 1. deň po zákroku. z 19 nežiaducich udalostí hlásených v 2. časti štúdie sa pozorovali 3 nežiaduce udalosti hematómu súvisiace s pomôckou a 6 nezávažných udalostí potenciálne súvisiacich s pomôckou vrátane 3 hlásení pretrvávajúceho výtoku, 2 hematómov a 1 bolesti nohy po cvičení.

V 2. časti bola u 3 pacientov liečba považovaná za zlyhanú: u 2 z dôvodu nedosiahnutia hemostázy bez použitia kompresie a u 1 z dôvodu závažnej vaskulárnej komplikácie (pseudoaneuryzma). v 1. časti štúdie sa nevyskytli žiadne zlyhania liečby.

Zo šiestich porúch pomôcky v 2. časti štúdie tri nemali vplyv na zákrok, jedna bola priradená k chybe používateľa, jedna bola presakovanie závädzača a jedna predstavovala zlomený spoj filamentu. Posledné dva problémy boli riešené aktualizáciami implementovanými v modeli C11202.

2. časť klinickej štúdie pred uvedením na trh nehlásila výsledky následnej kontroly po 6 mesiacoch z dôvodu nesplnenia požiadaviek pacienta. Výsledky po 30 dňoch v klinickej štúdii pred uvedením na trh (EU-SE-001), čo je v súlade s obdobím následných kontrol v klinickej literatúre, dokazujú, že pomôcka FemoSeal™ VCS je bezpečná a účinná.

## 1.4.2 Súhrn údajov z klinických štúdií po uvedení na trh

V **tabuľke 1.6** nižšie sú popísané 4 ukončené klinické štúdie po uvedení na trh. Tieto klinické skúšania nie sú zverejnené ani dostupné online.

**Tabuľka 1.6 Klinické štúdie po uvedení na trh**

| Dokončené klinické štúdie po uvedení na trh                                                    |                                                              |                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                         |    |     |          |       |          |           |    |           |           |                         |          |                    |            |                     |           |                   |         |                       |          |                                |          |                      |           |                          |           |                                   |          |                      |        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Štúdia z roku 2006 bola vykonaná na potvrdenie bezpečnosti a účinnosti aktuálnej pomôcky so zlepšeným zavádzacím systémom a na získanie spätnej väzby v súvislosti s návodom na použitie pomôcky FemoSeal™ VCS a školiacim programom. Štúdia zahŕňala 100 pacientov a primárnym koncovým ukazovateľom bolo, či sa dosiahla hemostáza, alebo či boli potrebné ďalšie manuálne alebo mechanické kompresie. Záverom tejto štúdie bolo, že použitie pomôcky FemoSeal™ VCS bolo úspešné vo väčšine prípadov (91 % dosiahlo okamžitú hemostázu).

Štúdia z roku 2008 zahŕňala 50 pacientov na posúdenie bezpečnosti a výkonnosti pomôcky FemoSeal™ VCS pri použití počas bežnej klinickej praxe u pacientov podstupujúcich katetrizáciu srdca s puzdrom veľkosti 7 Fr. Primárnym koncovým ukazovateľom štúdie bolo zhromaždiť údaje o čase do hemostázy a čase do ambulácie bez dodatočnej kompresie, ručnej alebo mechanickej. Výsledkom štúdie bolo, že stredný čas na dosiahnutie hemostázy bol 57,8 sekundy a všetci pacienti po 4 hodinách pokoja na lôžku boli ambulovaní.

Štúdia z roku 2009 mala za cieľ vyhodnotiť nové balenie FemoSeal™ VCS. Do štúdie bol zaradených 25 pacientov. Primárnym koncovým ukazovateľom bolo, či používateľ mal s obalom nejaké problémy. Používatelia nezaregistrovali žiadne problémy týkajúce sa nového balenia pomôcky FemoSeal™ VCS. Táto štúdia získala tiež údaje o čase do hemostázy.

Cieľom štúdie z roku 2022 bolo zozbierať údaje o bezpečnosti a účinnosti pomôcky FemoSeal™ VCS pri dosahovaní hemostázy miest prístupu do spoločnej femorálnej artérie (CFA) u osôb v reálnej situácii, ktorí podstupovali perkutánne endovaskulárne zákroky. Do štúdie bol zaradených 230 pacientov. Primárne koncové ukazovatele pre register sú úspešnosť zákroku (t. j. úspešná hemostáza v mieste vpichu) a zníženie závažných komplikácií (napr. poranenie ciev, krvácanie v mieste prístupu, infekcia v mieste prístupu, opakovaná manuálna kompresia a nová ipsilaterálna akútna ischémia nohy súvisiaca s miestom prístupu). Štúdia dospela k záveru, že pomôcka FemoSeal™ VCS funguje dobre v reálnom prostredí, vytvára účinnú hemostázu a má nízku mieru komplikácií v mieste prístupu u pacientov podstupujúcich periférne endovaskulárne zákroky. Preukazuje dobrú výkonnosť s krátkym časom do dosiahnutia hemostázy a dobrou spätnou väzbou od používateľa, vďaka čomu je systém FemoSeal™ VCS cenná pomôcka na uzavretie femorálneho prístupu.

### **1.4.3 Súhrn údajov z klinického sledovania po uvedení na trh**

#### **1.4.3.1 Dokončené klinické sledovanie po uvedení na trh**

Súhrn dokončených činností klinického sledovania po uvedení na trh je uvedený v **tabuľke 1.7** nižšie.

**Tabuľka 1.7. Činnosti klinického sledovania po uvedení na trh**

Spoločnosť Terumo Medical Corporation vykonala tri vysokokvalitné prieskumy používateľov z radov lekárov počas aktuálneho vykazovaného obdobia (1. september 2019 - 31. august 2024).

Klinické prieskumy FemoSeal™ zhromažďovali proaktívne klinické údaje týkajúce sa bezpečnosti a výkonnosti pomôcky FemoSeal™ VCS počas klinického používania. Prieskum obsahoval otázky zamerané celkovo na pomôcku a súvisiace príslušenstvo vrátane vodiaceho drôtu s rozmerom 0,038" a ich priamych interakcií. Klinické prieskumy týkajúce sa vodiacich drôtov zhromažďovali proaktívne klinické údaje vo vzťahu k bezpečnosti a výkonnosti počas klinického používania vodiaceho drôtu s rozmerom 0,038" dodávaného spolu s pomôckou FemoSeal™ VCS. Otázky prieskumu sú zamerané špecificky na všeobecné použitie vodiaceho drôtu od zavedenia cez procedurálny zavádzáč do vaskulatúry až po odstránenie drôtu.

Pomôcka FemoSeal™ VCS a vodiaci drôt 0,038" dodaný s pomôckou získali na základe vyhodnotenia pripomienok získaných z vysokokvalitných klinických prieskumov všetky prijateľné hodnotenia a šesť (6) sťažností bolo zaznamenaných pre pomôcku a deväť (9) podnetov týkajúcich sa vodiaceho drôtu. Sťažnosti boli posúdené pre pomôcku FemoSeal a vodiaci drôt a boli vyhodnotené ako súčasť procesu spoločnosti Terumo sledovania po uvedení na trh. Neboli identifikované žiadne nové riziká ani úrovne rizika.

V roku 2024 bol v rámci aktivít PMCF vykonaný prieskum používateľov z radov lekárov. Výsledky prieskumu preukázali, že hodnotenie výkonnosti a bezpečnosti pomôcky FemoSeal™ VCS boli celkovo veľmi priaznivé. Bola preukázaná aj kompatibilita iných vodiacich drôtov ako je štandardný drôt dodávaný s pomôckou FemoSeal™ VCS.

#### 1.4.3.2 Prebiehajúce/plánované klinické sledovanie po uvedení na trh

TMC má jedno prebiehajúce/plánované klinické sledovanie po uvedení na trh. Klinický prieskum bude ukončený na prospektívne zozbieranie spätnej väzby týkajúcej sa používania vodiaceho drôtu s pomôckou FemoSeal VCS distribuovanou na trhu v EÚ. Tento prieskum vyplnia lekári, aby sa zistilo, ktoré vodiace drôty sa používajú počas zákroku. Účel prieskumu je

zamerať sa na medzeru identifikovaných ako nedostatok literatúry a komentárov externých recenzentov o kompatibilitu pomlcky FemoSeal™ VCS s použitím iných vodiacich drôtov od iných značiek ako Terumo. Spätná väzba zahŕňa technické výsledky, klinickú výkonnosť a bezpečnosť týkajúce sa výkonnosti pomôcky s rôznymi vodiacími drôťmi.

#### 1.4.4 Súhrn údajov zo systematického prehľadu literatúry

Spoločnosť Terumo Medical Corporation vykonáva systematický prehľad literatúry s cieľom zhromažďovať a vyhodnocovať údaje o klinickej bezpečnosti a výkone z publikovaných štúdií o pomôcke FemoSeal™ VCS a/alebo podobných pomôckach. Cieľom každoročného vyhľadávania v publikovanej literatúre je identifikovať doteraz neznáme vedľajšie účinky, sledovať známe vedľajšie účinky, identifikovať nové riziká a identifikovať možné systematické nesprávne používanie alebo používanie mimo indikácie pomôcky FemoSeal™ VCS.

Najnovší systematický prehľad literatúry, ktorý zahŕňal obdobie od 1. septembra 2019 do 31. augusta 2024, identifikoval 29 publikovaných štúdií, v ktorých boli klinické údaje o bezpečnosti a výkonnosti pomôcky FemoSeal™ VCS. v 23 odkazoch sa hlásilo použitie pomôcky FemoSeal™ VCS v schválenej indikácii a použitie mimo schválenej indikácie sa hlásilo v 9 štúdiách. Vo všeobecnosti prehľad literatúry o štúdiách zameraných na špecifické používanie pomôcky FemoSeal™ VCS predstavuje skúmanú populáciu, ktorá je reprezentatívna pre pacientov v EÚ podstupujúcich perkutánne cievne katetrizačné zákroky. v **časti 3** nájdete zoznam 23 recenzovaných publikácií týkajúcich sa schválených indikácií.

Klinický výkon bol hodnotený podľa nasledujúcich ukazovateľov:

- Čas do dosiahnutia hemostázy je pri perkutánnom uzavretí spoločnej femorálnej artérie kratší alebo porovnateľný so súčasným stavom technológií.
- Čas do ambulácie je pri perkutánnom uzavretí spoločnej femorálnej artérie kratší alebo porovnateľný so súčasným stavom technológií.
- Miera pooperačných komplikácií je porovnateľná alebo nižšia ako pri aktuálnej štandardnej starostlivosti.

Na základe týchto klinických meraní výkonnosti údaje v tejto literatúre ukázali, že FemoSeal™ VCS sa môže úspešne použiť pri uzatváraní femorálnej arteriálnej punkcie (arteriotómie) u pacientov, ktorí podstúpili perkutánnu katetrizáciu pomocou 7 Fr alebo menšieho procedurálneho puzdra. Úplná hemostáza sa dosiahla u väčšiny pacientov (79,65 – 100 %) a bola spojená s mediánom času do dosiahnutia hemostázy 0,5 minúty a s priemerným časom do prepustenia z nemocnice 3 dni. 69,2 – 86,7 % pacientov bolo schopných pohybovať sa 5 hodín po uzavretí s priemerným pooperačným pokojom na lôžku 349 minút. Zlyhanie pomôcky FemoSeal™ VCS sa pozorovalo v 3,68 – 4 % prípadov a dodatočná manuálna kompresia bola potrebná v 0,9 – 4,4 % zákrokov.

Klinická bezpečnosť bola hodnotená nežiaducimi udalosťami, medzi ktoré okrem iných patria:

- Krvácanie
- Hematóm
- Pseudoaneuryzma
- Podliatina
- Arteriovenózna fistula
- Infekcia
- Smrť

V prípade každej z týchto nežiaducich udalostí bola miera výskytu hlásená pre pomôcku FemoSeal™ VCS v zahrnutých štúdiách nižšia alebo porovnateľná s mierami pre manuálnu kompresiu hlásenými v minulosti a inými pomôckami na uzatváranie ciev.

Na základe preskúmania 10 správ o prípade neboli zistené žiadne nežiaduce udalosti, keďže neboli identifikované žiadne nové, neočakávané, rozvíjajúce sa ani neprijateľné riziká.

Celková účinnosť používania pomôcky FemoSeal™ VCS počas diagnostickej angiografie alebo intervenčných chirurgických zákrokov závisí od viacerých faktorov, ako sú: pohlavie, vek, anatómia pacienta, komorbidity, anatomické umiestnenie miesta vpichu, skúsenosti chirurga, metóda zavedenia VCD, pooperačná starostlivosť, atď. Okrem technického úspechu vrátane dosiahnutia hemostázy má pomôcka FemoSeal™ VCS klinické prínosy vo vzťahu k uzavretiu ciev po femorálnej arteriálnej punkcii, ako je skrátenie času do dosiahnutia hemostázy, skrátenie času do ambulácie. Výsledky výkonnosti pre pomôcku FemoSeal™ VCS sú konzistentné s výsledkami, ktoré sa očakávajú pre tento typ pomôcky pri použití na určený účel. Niektoré z referencií zistených počas aktuálneho vyhľadávacieho obdobia ukázali použitie predmetnej pomôcky na inom anatomickom mieste ako na spoločnej femorálnej artérii a na uzavretie arteriotómií > 7Fr, čo sa považuje za použitie mimo schválenej indikácie.

Počas prieskumu sa nezistili žiadne neznáme vedľajšie účinky, rozvíjajúce sa riziká ani možné systematické nesprávne používanie pomôcky. Ak sa však pomôcka FemoSeal™ VCS používa opatrne vyškolenými lekármi, zdravotnícka pomôcka je užitočnou a potrebnou klinickou pomôckou. Celkovo cieľová liečba, a teda pomôcka FemoSeal™ VCS, rieši klinickú potrebu, ktorá v súčasnosti existuje pri liečbe komplikácií súvisiacich s cievnyim prístupom.

Celkovo údaje v tomto prehľade literatúry neidentifikovali žiadne predtým neznáme problémy s výkonnosťou alebo bezpečnosťou v klinickom prostredí alebo nežiaduce účinky, ktoré sa vyskytli vo vyššej miere, ako sa predpokladalo/akceptovalo. z tohto dôvodu možno na základe tohto prehľadu literatúry dospieť k záveru, že pomôcka FemoSeal™ VCS používaná na vytvorenie kompresie na dosiahnutie hemostázy pri arteriotómii po perkutánnej katetrizácii bude naďalej fungovať podľa očakávaní a nespája sa so závažnými bezpečnostnými udalosťami.

### 1.4.5 Súhrn údajov z dohľadu po uvedení na trh

Je zavedený proaktívny systém dohľadu po uvedení na trh (Post-Market Surveillance, PMS) a každý mesiac sa vykonáva preskúmanie všetkých sťažností v súlade s internými výrobnými postupmi. Údaje o sťažnostiach sa analyzovali v období od 1. septembra 2019 do 31. augusta 2024. Celkovo bolo k dispozícii 28 správ z dohľadu nad zdravotníckou pomôckou (Medical Device Vigilance, MDV) a 476 hlásení o sťažnostiach zákazníkov podaných výrobcovi. z 28 správ MDV 27 súviselo s nežiaducimi udalosťami a jedna s poruchou funkcie pomôcky. Počas vykazovaného obdobia došlo k dvom úmrtiam, ale žiadne z hlásených úmrtí nebolo považované za súvisiace s predmetnou pomôckou. Spomedzi 476 sťažností podaných výrobcovi boli najčastejšími dôvodmi sťažností ťažkosti so zavedením pomôcky (146 udalostí, miera výskytu 0,0142 %). Udalosti režimu poruchy pri vyťahovaní je druhý najčastejší sa vyskytujúci dôvod s mierou 0,0126 % (130 udalostí).

Cievny uzatvárací systém FemoSeal Vascular Closure System bol predaný viac ako 1 030 136-krát na celom svete a 827 843-krát v Európskom hospodárskom priestore. Vypočítaná frekvencia sťažností na základe globálneho predaja je 0,046 %. Celková miera sťažností zákazníkov je veľmi nízka. Neboli zistené žiadne nové riziká, ktoré nie sú zahrnuté v návode na použitie a v dokumentácii o rizikách.

Frekvencia výskytu nežiaducich vedľajších účinkov je uvedená v **tabuľke 1.2**. Neboli identifikované žiadne nové neočakávané, rozvíjajúce sa ani neprijateľné riziká. Nevyskytlo sa žiadne významné zvýšenie frekvencie alebo závažnosti známych nežiaducich vedľajších účinkov.

### 1.4.6 Celkový súhrn parametrov klinického výkonu a bezpečnosti

Systém FemoSeal™ VCS je indikovaný na použitie pri uzatvorení bežnej femorálnej arteriálnej punkcie (arteriotómie) u pacientov, ktorí podstúpili perkutánnu katetrizáciu pomocou 7F (2,33 mm) alebo menšieho procedurálneho zavádzača. Toto klinické hodnotenie je založené na komplexnej analýze dostupných klinických údajov pred uvedením a po uvedení na trh a literatúry, ktoré sú relevantné pre určené použitie pomôcky FemoSeal™ VCS.

Bolo vykonané komplexné preskúmanie publikovanej literatúry za obdobie od 1. septembra 2019 do 31. augusta 2024. Súbor dôkazov zahŕňal 29 štúdií pre pomôcku FemoSeal™ VCS. Dôkazmi uvedenými v klinickom hodnotení sa dospelo k záveru, že pri indikovanom použití je predmetná pomôcka bezpečná a účinná a všetky riziká alebo nežiaduce vedľajšie účinky, ktoré môžu byť spojené s pomôckou za normálnych podmienok používania, predstavujú prijateľné riziká pri zvážení oproti prínosom pre pacienta. Výsledky výkonu pre predmetné pomôcky sú konzistentné s tými, ktoré sa očakávajú pre tento typ pomôcky pri použití na určený účel.

Medzi potenciálne nežiaduce vedľajšie účinky spojené s použitím pomôcky FemoSeal™ VCS patria nežiaduce udalosti bežne hlásené pri alternatívnych spôsoboch uzáveru arteriotómie, napr.

krvácenie a hematóm. Celkovo sú miery výskytu nežiaducich udalostí hlásených pri použití pomôcky FemoSeal™ VCS podobné mieram hláseným pri manuálnej kompresii a pri použití podobných pomôcok na uzatváranie ciev. Konkrétne v prípade krvácania a hematómu sú hlásené miery pre pomôcku FemoSeal™ VCS nižšie ako hlásené miery pre podobné pomôcky na uzatváranie ciev. Každá z hlásených nežiaducich udalostí z publikovanej literatúry aj zo sledovania po uvedení pomôcky na trh bola už v minulosti identifikovaná (pozri **časť 1.3**).

Existujúce údaje týkajúce sa klinickej bezpečnosti a výkonnosti pomôcky FemoSeal™ VCS naznačujú, že prínosy pre pacientov z používania pomôcky na uzatváranie ciev prevažujú nad možnými rizikami, ak sa používa v súlade s návodom na používanie.

Ako je uvedené v predchádzajúcich častiach, údaje uvádzané pre pomôcku FemoSeal™ VCS preukazujú súlad medzi údajmi o hodnotenej pomôcke (napr. používanie pomôcky, výsledky bezpečnosti, klinická výkonnosť a klinické prínosy), identifikovanými ekvivalentnými pomôckami a údajmi o podobných pomôckach uvedených v zozname Najnovší stav technológií.

Krížovou analýzou údajov o bezpečnosti sa nezistili žiadne rozdiely medzi:

- Údajmi uvedenými v zozname Najnovší stav technológií
- Údajmi špecifickými pre hodnotenú pomôcku
- Údajmi uvedenými v súbore(-och) o riadení rizík
- Údajmi uvedenými na označení a/alebo v návode na použitie (t. j. reziduálne riziká, ktoré sa majú oznámiť používateľovi sú adresované).

Klinická bezpečnosť sa preukázala nízkymi mierami komplikácií identifikovanými v publikovanej recenzovanej klinickej literatúre, v klinických štúdiách zadávaných spoločnosťou, v prieskumoch údajov po uvedení na trh spolu so žiadnym stiahnutím z trhu. Neboli zistené žiadne výhrady týkajúce sa výkonnosti, preskúmaná literatúra obsahovala použitie pomôcky FemoSeal™ VCS, ktoré bolo v súlade s určeným použitím výrobcu.

## **1.5 Možné diagnostické alebo terapeutické alternatívy**

Po cievnej katetrizácii sa na dosiahnutie hemostázy v mieste arteriotómie tradične používa manuálna kompresia. Manuálna kompresia je spojená s dlhodobou imobilizáciou pacienta (až 8 hodín po zákroku) a so značným nepohodlím a dlhšou hospitalizáciou. v nedávnom systematickom prieskume sa zistilo, že medián času na dosiahnutie hemostázy s manuálnou kompresiou bol 20,8 minúty.<sup>1</sup>

Medzi alternatívy k manuálnej kompresii patria externé pomôcky na dosiahnutie hemostázy, ktoré aplikujú mechanickú kompresiu na miesto arteriotómie. Tieto pomôcky neskracujú čas na dosiahnutie hemostázy ani čas na dosiahnutie ambulácie, znižujú však nároky na personál nahradením manuálnej kompresie mechanickou kompresiou. Miery výskytu nežiaducich udalostí

súvisiacich s použitím mechanickej kompresie sú podobná mieram výskytu súvisiacim s použitím manuálnej kompresie.

Cievne uzatváracie pomôcky, ako je FemoSeal™ VCS, sú určené na uzavretie arteriotómie. Cieľom je skrátiť čas potrebný na dosiahnutie hemostázy a umožniť skoršiu ambuláciu. Nedávna systematická recenzia zahŕňajúca 13 komerčne dostupných pomôcok zistila, že medián času na dosiahnutie hemostázy s pomôckou na uzavretie ciev bol 5,4 minúty. Medián času na dosiahnutie hemostázy pre jednotlivé pomôcky na uzavretie ciev sa pohyboval od 1 minúty (FemoSeal™ VCS) do 14 minút; pričom pre väčšinu pomôcok je od 4 do 10 minút.<sup>1</sup>

Najčastejšie hlásené nežiaduce udalosti spojené so uzavretím miesta arteriotómie s manuálnymi kompresiami, externými hemostatickými pomôckami alebo pomôckami na uzavretie ciev zahŕňajú hematóm, krvácanie v mieste prístupu, pseudoaneuryzmu, arteriovenóznú fistulu a infekciu. Rovnaký systematický prehľad (34 randomizovaných kontrolovaných štúdií, 14 401 pacientov) zistil, že miery nežiaducich udalostí boli podobné medzi manuálnou kompresiou a použitím pomôcok na uzavretie ciev, s výnimkou toho, že krvácanie malo tendenciu byť o niečo vyššie pri pomôckach na uzavretie ciev.<sup>1</sup>

## 1.6 Odporúčaný profil používateľa a školenie

Určenými používateľmi cievneho uzatváracieho systému FemoSeal™ Vascular Closure System sú lekári vyškolení na vykonávanie arteriálneho prístupu a uzatváranie endovaskulárnych zákrokov prostredníctvom spoločnej femorálnej artérie a zúčastnili sa školenia lekárov o používaní pomôcky FemoSeal™ od spoločnosti Terumo Medical Corporation.

## 1.7 Relevantné harmonizované a bežné normy

| Označenie normy | Aktuálny rok súladu/revízia | Popis                                                                                                |

Ta povzetek o varnosti in klinični učinkovitosti (SSCP – Summary of Safety and Clinical Performance) zagotavlja javni dostop do posodobljenega povzetka glavnih vidikov varnosti in klinične učinkovitosti sistema žilnega zapirala FemoSeal™ Vascular Closure System (VCS).

Povzetek o varnosti in klinični učinkovitosti pripomočka, ki je namenjen uporabnikom/zdravstvenim delavcem, je na voljo spodaj v **razdelku 1.0**.

## **1.0 POVZETEK ZA UPORABNIKE/ZDRAVSTVENE DELAVCE**

SSCP ne nadomešča navodil za uporabo kot glavnega dokumenta za zagotovitev varne uporabe pripomočka, niti ni namenjen zagotavljanju diagnostičnih ali terapevtskih predlogov za predvidene uporabnike ali paciente. SSCP ne nadomešča obveznih podatkov na karticah vsadkov ali v drugih obveznih dokumentih.

### **1.1 Predvidena uporaba pripomočka**

#### **1.1.1 Predvidena uporaba**

Sistem žilnega zapirala FemoSeal™ Vascular Closure System je medicinski pripomoček, namenjen zaprtju arterijske punkcije po perkutani kateterizaciji skozi skupno femoralno arterijo.

#### **1.1.2 Indikacije za uporabo**

Sistem žilnega zapirala FemoSeal™ Vascular Closure System je indiciran za uporabo pri zapiranju skupne femoralne arterijske punkcije (arteriotomije) pri pacientih, pri katerih je bila opravljena perkutana kateterizacija z uporabo žilnega uvajala 7 Fr (2,33 mm) ali manjšega.

#### **1.1.3 Kontraindikacije in/ali omejitve**

Sistem žilnega zapirala FemoSeal™ Vascular Closure System je kontraindiciran pri pacientih z arteriotomijami, pri katerih so bila uporabljena uvajala ali pripomočki, večji od 7 Fr (2,33 mm).

#### **1.1.4 Ciljne populacije pacientov**

Varnost in učinkovitost sistema žilnega zapirala FemoSeal™ Vascular Closure System je bila ugotovljena pri pacientih, starih 18 let in več, pri katerih je bila opravljena perkutana kateterizacija z uporabo žilnega uvajala 7 Fr (2,33 mm) ali manjšega.

#### **1.1.5 Posebne populacije pacientov**

Varnost in učinkovitost sistema žilnega zapirala FemoSeal™ Vascular Closure System ni bila ugotovljena pri naslednjih populacijah pacientov:

- pacientih z že obstoječo avtoimunsko boleznijo;
- pacientih, pri katerih je bila izvedena terapevtska tromboliza;
- pacientih s klinično pomembno periferno arterijsko boleznijo;
- pacientih z nenadzorovano hipertenzijo (sistolično > 220 mmHg ali diastolično > 110 mmHg);
- pacientih z motnjo krvavitve, vključno s trombocitopenijo (< 100.000 trombocitov) ali anemijo (Hgb < 10 mg/dl);

- pacientih z notranjo svetlino skupne femoralne arterije, manjšo od 5 mm;
- pacientih z okvaro ledvic in/ali jeter;
- pacientih z drugimi pomembnimi sočasnimi boleznimi;
- populaciji z določenim rasnim in/ali etničnim poreklom;
- pacientih, ki so v zadnjih 72 urah doživeli miokardni infarkt;
- pacientih z žilnim presadkom ali stentom na mestu punkcije;
- pacientkah, ki so noseče ali dojijo;
- pacientih, mlajših od 18 let.

### 1.1.6 Predvideni uporabniki

Predvideni uporabniki sistema žilnega zapirala FemoSeal™ Vascular Closure System so zdravniki, ki so usposobljeni za izvajanje arterijskega pristopa in zapiranja pri endovaskularnih posegih skozi skupno femoralno arterijo in so se udeležili programa usposabljanja zdravnikov za uporabo pripomočkov FemoSeal™ družbe Terumo Medical Corporation.

## 1.2 Opis pripomočka

### 1.2.1 Opis pripomočka

Sistem žilnega zapirala FemoSeal™ Vascular Closure System, ki ga proizvaja Terumo Medical Corporation (TMC), je resorbilno žilno zapiralo, zasnovano za doseganje femoralne arterijske hemostaze po perkutani kateterizaciji skozi skupno femoralno arterijo.

Zapiralni elementi FemoSeal™ so sestavljeni iz dveh resorbilnih polimernih ploščic, notranjega tesnila in zunanje zaklepne ploščice, ki ju skupaj drži resorbilni multifilament, s čimer se arteriotomija mehansko zapre (glejte **sliko 1.1** in **sliko 1.2**). Zunanja zaklepna ploščica se po namestitvi skozi uvajalo stožčastega ohišja pritisne na multifilamentno os, zaradi česar se mesto punkcije med notranjo in zunanjo zaklepno ploščico mehansko zapre. Zaradi trenja na multifilamentni osi notranje tesnilo in zunanja zaklepna ploščica ostaneta na svojem mestu. Hemostaza se doseže z mehanskimi sredstvi. Zapiralni elementi se razgradijo s hidrolizo.

Vsadni zapiralni komponenti, notranje tesnilo in zunanja zaklepna ploščica, se razgradita v osemnajstih (18) mesecih, medtem ko se multifilament po ocenah razgradi in absorbira s hidrolizo okoliškega tkiva po dveh (2) do treh (3) letih. Sposobnost vsadnih zapiralnih komponent, da ohranjajo kompresijo na mestu arteriotomije, je bila preizkušena do osem (8) ur. Razgradni produkti se presnovijo in izločijo z urinom ali izdihajo kot ogljikov dioksid skozi pljuča. v študijah na živalih niso opazili učinkov kopičenja. Dodatne komponente FemoSeal™, ki bodo

med posegom prišle v stik z živim tkivom ali krvjo, so uvajalo stožčastega ohišja, dilatator, cevka za stisnjenje, potiskalo in vodilna žica.

**Slika 1.1 Notranje tesnilo in zunanja zaklepna ploščica**

**Slika 1.2 Namestitev notranjega tesnila in zunanje zaklepne ploščice**

Enota FemoSeal™ je pakirana skupaj z dilatatorjem, vodilno žico z zunanjim premerom 0,038" (0,97 mm) in dolžine 27,5" (70 cm) ter J-ravnalom; glejte **slika 1.3** spodaj. Vodilna žica je v polietilenski cevki. Vsi deli so pakirani na pritrjenem papirnatem pladnju. Pakiranje vsebuje tudi kartico o vsadku za pacienta. Sistem žilnega zapirala FemoSeal™ Vascular Closure System ne zahteva dodatnega pribora, da bi pripomoček deloval, kot je predvideno, pripomoček pa je namenjen le uporabi z dilatatorjem in vodilno žico, ki sta priložena v pakiranju izdelka.

**Slika 1.3 Enota FemoSeal™ VCS z vodilno žico in dilatatorjem**

### 1.2.2 Surovine in komponente

V spodnji preglednici 1.1 so navedene komponente sistema FemoSeal™ VCS.

**Preglednica 1.1 Surovine in komponenta sistema FemoSeal™ VCS**

\* Vsadni del pripomočka; vsadne komponente so varne za slikanje z MR

Sistem FemoSeal™ VCS je steriliziran z etilenoksidom (EO) in je medicinski pripomoček za enkratno uporabo. Sistem FemoSeal™ VCS je zasnovan tako, da ga ni mogoče ponovno uporabiti.

### **Način delovanja**

FemoSeal™ VCS spodbuja mehansko hemostazo z nameščenimi zapiralnimi elementi znotraj in zunaj skupne femoralne arterije. Notranje tesnilo, ki zapre mesto punkcije, in zunanja zaklepna ploščica, ki drži notranje tesnilo na mestu, zagotavljata mehanizem za preprečevanje krvavitve.

### **1.2.3 Klinična korist**

FemoSeal™ VCS zagotavlja naslednje klinične koristi v primerjavi z zaprtjem žil po punkciji skupne femoralne arterije:

- Krajši čas do hemostaze<sup>1</sup>
- Krajši čas do hoje<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Predhodna(-e) generacija(-e) ali različice

- Prva različica sistema FemoSeal™ VCS (št. 11200) je bila na evropskem trgu naprodaj v letu 2005 in nekaj časa v letu 2006.
- Trenutni sistem FemoSeal™ VCS (št. 11202), ki ima izboljšan uvajalni sistem, je na trgu od 28. marca 2006.

#### 1.2.5 Dodatki, namenjeni uporabi v kombinaciji s pripomočkom

Enota FemoSeal™ je pakirana skupaj z dilatatorjem, vodilno žico z zunanjim premerom 0,038" (0,97 mm) in dolžine 27,5" (70 cm) ter J-ravnalom. Vodilna žica je dodatek za enoto FemoSeal™. J-ravnalo je komponenta vodilne žice, medtem ko je dilatator komponenta enote FemoSeal™. Kot dodatek se obravnava samo vodilna žica. Vodilna žica je v polietilenski cevki. Vsi deli so pakirani na pritrjenem papirnatem pladnju. Pakiranje vsebuje tudi kartico o vsadku za pacienta. Sistem žilnega zapirala FemoSeal™ Vascular Closure System ne zahteva dodatnega pribora, da bi pripomoček deloval, kot je predvideno, pripomoček pa je namenjen le uporabi z dilatatorjem in vodilno žico, ki sta priložena v pakiranju izdelka.

#### 1.2.6 Drugi pripomočki in izdelki, namenjeni uporabi v kombinaciji s pripomočkom

FemoSeal™ VCS ne potrebuje dodatnih pripomočkov za predvideno delovanje.

### 1.3 Tveganja in opozorila

#### 1.3.1 Preostala tveganja in neželeni učinki

Znani ali predvidljivi neželeni dogodki, škodljive posledice in zapleti, povezani z uporabo sistema FemoSeal™ VCS, ki so posledica preostalih tveganj, so navedeni v **preglednici 1.2**. Stopnja pojavljanja temelji na analizi dokumentacije o tveganju in se izračuna na podlagi podatkov o nadzoru po dajanju na trg od 1. septembra 2019 do 31. avgusta 2024. Za sistem FemoSeal™ VCS ni neznanih preostalih tveganj, vsa ustrezna tveganja pa so bila primerno obravnavana v navodilih za uporabo in procesu obvladovanja tveganja.

### Preglednica 1.2. Neželeni dogodki/zapleti pri pripomočku FemoSeal

| Škodljiva posledica                     | Stopnja pojavljanja (%) | Dejavniki za zmanjšanja tveganja                                                                                                                                                  |

### 1.3.2 Opozorila in previdnostni ukrepi

#### Opozorila

1. Ne uporabljajte, če je embalaža poškodovana ali če sterilna pregrada ni nepoškodovana.
2. Ne uporabljajte po izteku roka uporabnosti – biorazgradljive komponente morda ne bodo pravilno delovale.
3. Ne uporabljajte, če je kateri koli izdelek poškodovan ali ima kakršno koli napako.
4. Uporaba sistema žilnega zapirala FemoSeal™ Vascular Closure System, pri kateri lahko pride do bakterijske kontaminacije žilnega uvajala ali okoliškega tkiva, lahko povzroči okužbo.
5. Če obstaja sum, da je bila posteriorna stena arterije prebodena, ali je bilo opravljenih več arterijskih punkcij, se za doseganje arterijske hemostaze ne zanašajte samo na sistem žilnega zapirala FemoSeal™ Vascular Closure System. Uporabite dodatno ročno ali mehansko kompresijo.
6. Če je mesto punkcije na bifurkaciji femoralne arterije ali distalno od nje, ne smete uporabiti sistema žilnega zapirala FemoSeal™ Vascular Closure System zaradi nevarnosti nepravilne namestitve notranjega tesnila. Ta dogodek lahko povzroči zaplete zaradi krvavitve in/ali motnje normalnega pretoka krvi.
7. Če se arterijska krvavitev iz mesta reza nadaljuje, multifilamenta ne prerežite, dokler ne dosežete hemostaze. Če hemostaza ni dosežena, pritrdite multifilament s sterilno oblogo za rano in izvajajte dodatno kompresijo, dokler ne dosežete hemostaze. v primeru vztrajne arterijske krvavitve lahko pride do pomembnih zapletov, ki lahko povzročijo poškodbe ali smrt pacienta.
8. Sistema žilnega zapirala FemoSeal™ Vascular Closure System ne uporabljajte, če je mesto punkcije proksimalno od ingvinalnega ligamenta, saj lahko pride do retroperitonealnega hematoma.
9. Pri pacientih z večjim tveganjem za krvavitev lahko pride do večje izgube krvi, zaradi česar je lahko potrebna transfuzija.
10. Če se notranja ploščica sname, lahko povzroči trombotični in/ali embolični dogodek.

#### Previdnostni ukrepi

1. Poseg namestitve sistema žilnega zapirala FemoSeal™ Vascular Closure System morajo izvesti zdravniki, ki so ustrezno usposobljeni za uporabo pripomočka.
2. Pred namestitvijo sistema žilnega zapirala FemoSeal™ Vascular Closure System opravite omejen femoralni angiogram ali ultrazvočno vodeno femoralno punkcijo.

3. Poseg prekinite, če:
  - je premer svetline skupne femoralne arterije  $< 5$  mm;
  - je v bližini mesta punkcije skupne femoralne arterije prisotna stenoza in/ali pomemben plak;
  - je arterijska punkcija na bifurkaciji femoralne arterije ali distalno od nje;
  - so v bližini mesta punkcije skupne femoralne arterije anomalne veje ali nepravilnosti žil.
4. Če je prisoten kakršen koli hematoma, je potrebna posebna previdnost pri pravilnem vstavljanju uvajala stožčastega ohišja v arterijo.
5. Uporabite tehniko punkcije samo ene stene. Ne prebodite posteriorne stene arterije.
6. Pri uporabi sistema žilnega zapirala FemoSeal™ Vascular Closure System vedno uporabljajte sterilno tehniko.
7. Sistem žilnega zapirala FemoSeal™ Vascular Closure System je namenjen samo za enkratno uporabo in ga ni dovoljeno ponovno sterilizirati ali na kakršen koli način ponovno uporabiti. Enota FemoSeal™ je zasnovana tako, da je ni mogoče ponovno uporabiti.
8. Če pri nameščanju notranjega tesnila naletite na nepričakovan upor, prekinite poseg.
9. Za pravilno namestitev notranjega tesnila prestavite svoj palec tako, da lahko gumb prosto odskoči.
10. Pred namestitvijo zunanje zaklepne ploščice se prepričajte, da je uvajalo stožčastega ohišja enote FemoSeal™ pod površino kože. Pri pacientih s kratko razdaljo med femoralno arterijo in kožo se lahko zunanja zaklepna ploščica nenamerno namesti nad raven kože.
11. Za pravilno namestitev bo morda pred namestitvijo potreben kožni rez.
12. Če je notranje tesnilo znotraj arterije, vendar ni mogoče popolnoma pritisniti gumba in namestiti zunanje zaklepne ploščice, bo za odstranitev zapiralnih elementov FemoSeal™ morda potreben kirurški poseg.
13. Če je v 18 mesecih potrebna ponovna punkcija iste femoralne arterije, jo je treba opraviti vsaj en centimeter proksimalno od prejšnjega mesta pristopa s sistemom žilnega zapirala FemoSeal™ Vascular Closure System.
14. Pacientu naročite, naj upošteva zdravnikova navodila glede pregledovanja mesta zaprtja.
15. Pacientu naročite, naj ima naslednjih 18 mesecev pri sebi kartico z informacijami za pacienta.

### **Previdnostni ukrepi ob odpustu iz bolnišnice**

Preden razmislite o odpustu iz bolnišnice, ocenite pacienta glede naslednjih kliničnih stanj:

1. krvavitve in/ali hematoma na mestu zaprtja;
2. bolečine med hojo;
3. znakov okužbe na mestu zaprtja.

### **1.3.3 Varnostni korektivni ukrepi**

V obdobju od 1. septembra 2019 do vključno 31. avgusta 2024 je bil izveden en varnostni korektivni ukrep v zvezi s sistemom FemoSeal™ VCS.

Leta 2022 je družba Terumo prostovoljno odpoklicala sistem FemoSeal™ VCS zaradi pritožb glede napak pri testiranju postopka in testiranju ob sprostitvi serij izdelka FemoSeal proizvajalca Elkton, predvidenega za merjenje sile stiskanja in uvlečne sile. s trga Južne Koreje je bilo odpoklicanih skupno 950 enot.

## **1.4 Klinično vrednotenje in klinično spremljanje po dajanju na trg**

**Preglednica 1.3** vsebuje seznam ključnih študij, ki so bile izvedene za pridobitev dovoljenja za dajanje sistema FemoSeal™ VCS na trg, ter študij po dajanju pripomočka na trg in dejavnosti kliničnega spremljanja po dajanju na trg. Različica pripomočka, uporabljena v študiji, je navedena v spodnji preglednici. Prva različica sistema FemoSeal™ VCS (št. 11200) je bila na trgu do leta 2006, medtem ko je bila naslednja različica (št. C11202) dana na trg leta 2006 in je trenutno na trgu.

### **Preglednica 1.3 Povzetek ključnih študij**

#### 1.4.1 Povzetek podatkov iz študij pred dajanjem na trg (testiranje na živalih in klinične raziskave)

V preglednici 1.4 spodaj so opisane vse študije pred dajanjem na trg, tako testiranja na živalih kot klinične raziskave.

**Preglednica 1.4 Povzetki študij pred dajanjem na trg**

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002</p> <p>Radi Medical System AB</p> <p>Izvedlo podjetje Biomatech, Francija</p> | <p>Študija na živalih</p> | <p>Namen študije je bil oceniti biokompatibilnost in biofunkcionalnost biorazgradljivega vsadka, zasnovanega za doseganje hemostaze v ožilju. Preizkušeni pripomoček bi moral vstopiti v vbodno odprtino v arterijah za doseganje hemostaze. Ena ploščica je vstopila v vbodno odprtino v arteriji, druga pa je zategnila notranjo ploščico z zunanje strani arterije. Obe ploščici sta bili vstavljeni skozi uvajalni tulec. Ploščici sta bili zasnovani tako, da preprečujeta krvavitve, se zacelita v steno žile ter se na koncu razgradita in absorbirata. Študija je bila zasnovana za zbiranje in analizo podatkov po funkcionalni vsaditvi pripomočka pri ovci in prašiču za oceno sposobnosti vsadka, da ohrani fiziološko funkcijo pri uporabi v obtočilih, ugotavljanje odziva gostitelja in odziva pripomočka (fizična celovitost, tkivna enkapsulacija ob usmrtnosti) ter oceno razgradnje vsadka.</p> | <p>Obdobje vsaditve/spremljanja je bilo pri vseh živalih 5 tednov.</p> <p>4 ovce, 1 prašič</p> <p>14 zapiralnih elementov</p> <p>8 zapiralnih elementov, vsajenih v 2 ovci,</p> <p>2 zapiralna elementa, vsajena v 1 prašiča</p> <p>Kadar sta bila v isto femoralno arterijo vsajena dva zapiralna elementa, sta bila vsajena na razdalji &gt; 30 mm.</p> | <p>Zabeleženi so bili vsi neželeni znaki (vnetje, nekroza, krvavitev ali katere koli druga poškodba) in vsakršen nastanek tanke psevdointimalne plasti. Posebna pozornost je bila posvečena začetni tkivni integraciji pripomočka, s posebnim poudarkom na enkapsulaciji notranje ploščice.</p> <p>Makroskopsko niso opazili nobenih pomembnih znakov lokalnega neprenašanja ali tromboze. Makroskopsko opazovanje ni pokazalo nobene razlike med ovci in prašiči po vsaditvi zapiralnih elementov v femoralne arterije. Makroskopsko niso opazili nobenih pomembnih znakov lokalnega neprenašanja ali tromboze. Makroskopsko opazovanje ni pokazalo nobene razlike med ovci in prašiči po vsaditvi zapiralnih elementov v femoralne arterije.</p> <p>Histopatološka analiza mesta vsaditve pri ovcih ni pokazala nobenih</p> |

|                                                                                                                  |                              |                                                   |                                                                                                                              |                                                                        | <p>lokalnih neželenih reakcij. Notranja in zunanja ploščica sta pokazali znake razgradnje in sta bili v nekaterih primerih razlomljeni na manjše delce. Notranja ploščica se je popolnoma integrirala v neointimalno tkivo. Pri prašičih je histopatološka analiza pokazala nekoliko več vnetnih znakov okoli notranje in zunanje ploščice. Pri obeh vrstah živalih je bilo pri multifilamentu nekoliko več vnetnih znakov kot pri materialu ploščic, kar je pri pletenih šivih zaradi večje površine normalno.</p> <p>Prehodnost žil je bila izmerjena po 5 tednih s tremi različnimi metodami: histomorfometrično, histomorfometrično v kombinaciji z merjenjem premera žile s kaliperjem in s preiskavo z barvnim Dopplerjevim ultrazvokom. Povprečna prehodnost žil pri ovcah je bila med 60 % in 80 %, odvisno od uporabljene metode (12 opazovanj). Pri prašičih je bila povprečna prehodnost žil med 40 % in 80 % (2 opazovanji).</p> |

V okviru razvojnega načrta za sistem FemoSeal™ VCS pred dajanjem na trg so bili opravljeni 3 funkcionalni testi na živalih. Leta 2000 je bila pred začetkom kliničnih študij izvedena študija na živalih za oceno biološke funkcionalnosti sistema FemoSeal™ VCS. v tej študiji je bila ocenjena sposobnost zapiralnih elementov, da ohranijo fiziološko funkcijo, ter njihova razgradnja.

Po 18 mesecih material notranje in zunanje ploščice ni bil več viden, saj ga je nadomestilo endoluminalno fibrozno tkivo. Zaključimo lahko, da je bila potrjena sposobnost zapiralnega elementa sistema FemoSeal™ VCS, da ohrani fiziološko funkcijo pri uporabi v obtočilih.

Leta 2002 je bila izvedena študija na živalih za oceno biokompatibilnosti in biofunkcionalnosti biorazgradljivega vsadka FemoSeal™ VCS, zasnovanega za doseganje hemostaze v ožilju.

Če povzamemo, je bila razgradnja vsadka do 36. tedna skoraj popolna in ni bilo pomembnih neželenih reakcij tkiva.

Leta 2002 so izvedli še eno študijo na živalih za oceno biokompatibilnosti in biofunkcionalnosti biorazgradljivega vsadka FemoSeal™ VCS, zasnovanega za doseganje hemostaze v ožilju.

Po 5 tednih je bila enkapsulacija ploščice popolna, pri notranji in zunanji ploščici pa je bilo opaziti znake razgradnje. Zaključimo lahko, da je bila potrjena sposobnost vsadka, da ohrani fiziološko funkcijo pri uporabi v obtočilih.

Družba Radi Medical System AB je v okviru načrta kliničnega razvoja za sistem FemoSeal™ VCS izvedla klinično raziskavo pred dajanjem na trg. Ta klinična raziskava ni objavljena in ni na voljo na spletu. Študija z modelom pripomočka št. 11200 je bila izvedena v letih 2002–2004 v skladu z evropskim standardom EN 540 (Klinične raziskave medicinskih pripomočkov za ljudi) in v skladu s smernicami ICH General Considerations for Clinical Trials in Guideline for Good Clinical Practice. Podrobnosti te študije so dokumentirane v poročilu EU-SE-001. Klinično preskušanje je bilo dokumentirano v končnem poročilu družbe Radi Medical Systems AB »Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures«. Klinična študija je bila izvedena s prvim modelom pripomočka FemoSeal™ št. 11200 in je bila osredotočena na varnost in učinkovitost vsadnih zapiralnih komponent. Edina razlika med prvim modelom št. 11200 in trenutnim modelom C11202 je v velikosti French, 6 Fr oziroma 7 Fr, ter izboljšanjem uvajalnem sistemu. Klinične koristi, predvidena uporaba, načela delovanja in surovine za vsadne zapiralne elemente, notranje tesnilo in zunanjo zaklepno ploščico ostajajo nespremenjeni.

Pripomoček je bil predviden za uporabo pri pacientih, pri katerih so bili opravljeni diagnostični srčni ali intervencijski posegi na srcu z uporabo femoralne arterije kot mesta pristopa. Cilj te študije je bil ugotoviti varnost, delovanje in učinkovitost sistema FemoSeal™ VCS. To je bila prospektivna, multicentrična, odprta študija z eno skupino in 30-dnevnim spremljanjem.

Primarna končna točka učinkovitosti je bil čas do hemostaze, opredeljen kot odsotnost pospešene krvavitve. Primarna končna točka varnosti je bila pojavnost večjih vaskularnih zapletov v 30 dneh. Sekundarne končne točke so vključevale čas do hoje, delež neuspešnih zdravljenj,

pogostnost neželenih dogodkov ter značilnosti učinkovitosti pripomočka med uvajanjem in namestitvijo.

V to študijo so bili vključeni odrasli pacienti, ki so lahko podali prostovoljno soglasje in so imeli vsaj en ohranjen pulz na nogah. Pacienti so bili izključeni iz študije, če so imeli katerega koli od naslednjih stanj:

- anamnezo periferne arterijske bolezni;
- avtoimunsko bolezen;
- znano motnjo krvavitve zaradi hude anemije;
- INR > 1,5;
- miokardni infarkt v 72 urah;
- nenadzorovano hipertenzijo kljub zdravljenju;
- debelost, ki preprečuje pristop s Seldingerjevo tehniko;
- prisotnost žilnega presadka ali stenta na mestu arteriotomije;
- predhodno ipsilateralno punkcijo v 3 mesecih;
- pričakovano življenjsko dobo < 6 mesecev.

Poleg tega so paciente pregledali intraoperativno in jih izključili iz študije, če so opazili kar koli od naslednjega:

- premer svetline skupne femoralne arterije < 5 mm;
- veje arterije znotraj 2 cm proksimalno od mesta punkcije;
- pomembno stenozo znotraj 3 cm od mesta punkcije;
- uporabo primarnega uvajalnega tulca velikosti > 6 Fr;
- punkcijo na femoralni bifurkaciji ali distalno od nje;
- več femoralnih punkcij;
- znana ali domnevna punkcija posteriorne stene femoralne arterije;
- velik hematoma (2 : 6 cm) ob zaključku posega;
- težave pri vstavljanju primarnega uvajala za poseg zaradi zvijuganega tkiva ali žile.

Ta študija z enim protokolom je bila izvedena v dveh delih: v 1. delu je bilo vključenih 20 pacientov, nato je bila opravljena analiza varnosti, v 2. delu pa je bilo vključenih dodatnih 60 pacientov.

V 1. delu je bila povprečna starost vključenih pacientov 65,9 leta, 70,0 % pacientov je bilo moškega spola in 95 % pacientov je prejelo sočasna zdravila. v 2. delu študije je bila povprečna starost 63,8 leta, 78 % je bilo moških in 100 % jih je prejelo sočasna zdravila.

V študijo so se lahko vključili pacienti z diagnostičnimi (1. in 2. del) ali intervencijskimi (2. del) posegi kateterizacije srca. Posegi so bili skladni s standardno oskrbo v vsaki od vključenih bolnišnic, čemur je sledila uporaba sistema FemoSeal™ VCS. Podatki o pacientih so bili zbrani ob izhodišču, med posegom ter 1 dan in 30 dni po posegu. Rezultati so povzeti v **preglednici 1.5** ter kažejo, da je sistem FemoSeal™ VCS varen in učinkovit za uporabo pri tej populaciji pacientov.

**Preglednica 1.5 Poročani klinični rezultati iz študije pred dajanjem na trg**

|                                                                                                         | 1. del      | 2. del                   |

| Srednji čas do hemostaze                                                                                | 1,2 minute  | 1,6 minute <sup>a</sup>  |
| Srednji čas do hoje                                                                                     | 72,2 minute | 87,5 minute <sup>b</sup> |
| Pojavnost večjih vaskularnih zapletov <sup>c</sup>                                                      | 0 (0 %)     | 1 (2 %)                  |
| Število pacientov z neželenimi dogodki                                                                  | 5 (25 %)    | 19 (32 %)                |
| Neuspešno zdravljenje (opredeljeno kot večji vaskularni zapleti, potreba po ročni kompresiji ali oboje) | 0 (0 %)     | 3 (5 %)                  |
| Okvare pripomočka                                                                                       | 0 (0 %)     | 6 (10 %)                 |

<sup>a</sup>Na podlagi skupnega vzorca 58 pacientov, ker pri 2 pacientih v času posega ni bila dosežena hemostaza zaradi predhodnih ipsilateralnih punkcij. Pri teh pacientih je bila hemostaza dosežena po 7 minutah in 37 minutah.

<sup>b</sup>Na podlagi skupnega vzorca 59 pacientov: 1 pacient ni bil vključen, ker je bil zaradi pljučnega edema priključen na respirator in več kot teden dni ni mogel hoditi.

<sup>c</sup>Opredeljen kot vaskularni zaplet, ki zahteva transfuzijo krvi ali kirurško reparacijo, ali lokalna okužba, ki zahteva uporabo antibiotika, hospitalizacijo oziroma podaljšanje hospitalizacije ali nekrektomijo.

V 1. delu študije ni bilo opaziti večjih vaskularnih zapletov. v 2. delu študije so poročali o 1 večjem vaskularnem zapletu: psevdoanevrizmi, o kateri so poročali v 1 dnevu po posegu. Dogodek je zahteval ultrazvočno vodeno kompresijo in injiciranje trombina v psevdoanevrizmo ter je podaljšal pacientovo hospitalizacijo.

Od 5 neželenih dogodkov, o katerih so poročali v 1. delu študije, je bil 1 neželeni dogodek verjetno povezan s pripomočkom: nenevaren dogodek pospešene krvavitve 1 dan po posegu. Od 19 neželenih dogodkov, o katerih so poročali v 2. delu študije, so bili s pripomočkom povezani 3 nenevarni neželeni dogodki hematoma, 6 nenevarnih dogodkov pa je bilo verjetno povezanih s pripomočkom, vključno s 3 poročili o neprestanem izcedku, 2 hematomoma in 1 bolečino v nogi po vadbi.

V 2. delu zdravljenje ni bilo uspešno pri 3 pacientih: pri 2 zaradi nedoseganja hemostaze brez uporabe kompresije in pri 1 zaradi večjega vaskularnega zapleta (psevdoanevrizme). v 1. delu študije ni bilo primerov neuspešnega zdravljenja.

Od šestih okvar pripomočka v 2. delu študije tri niso ovirale posega, ena je bila posledica napake uporabnika, ena je bila posledica puščanja uvajala, do ene pa je prišlo zaradi zlomljenega filamentnega spoja. Zadnji dve težavi sta bili odpravljeni s posodobitvami modela, izvedenimi na modelu C11202.

V 2. delu klinične študije pred dajanjem na trg niso poročali o 6-mesečnih rezultatih spremljanja zaradi neskladnosti pacientov. Rezultati 30-dnevne klinične študije pred dajanjem na trg (EU-SE-001), ki so v skladu z obdobjem spremljanja iz klinične literature, dokazujejo, da je sistem FemoSeal™ VCS varen in učinkovit.

## 1.4.2 Povzetek podatkov iz kliničnih študij po dajanju na trg

V spodnji preglednici 1.6 so opisane 4 zaključene klinične študije po dajanju na trg. Te klinične raziskave niso objavljene in niso na voljo na spletu.

**Preglednica 1.6 Klinične študije po dajanju na trg**

| Zaključene klinične študije po dajanju na trg                                                              |                                    |                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                    |                                                                                                                                                     |

Študija iz leta 2006 je bila izvedena za potrditev varnosti in učinkovitosti trenutnega pripomočka z izboljšanim uvajalnim sistemom ter pridobitev povratnih informacij o navodilih za uporabo sistema FemoSeal™ VCS in programu usposabljanja. v študijo je bilo vključenih 100 pacientov, primarna končna točka pa je bila, ali je bila dosežena hemostaza oziroma ali je bila potrebna dodatna ročna ali mehanska kompresija. v tej študiji je bilo ugotovljeno, da je bila uporaba sistema FemoSeal™ VCS uspešna v večini primerov (v 91 % je bila dosežena takojšnja hemostaza).

V študijo iz leta 2008 je bilo vključenih 50 pacientov za oceno varnosti in učinkovitosti sistema FemoSeal™ VCS pri običajni klinični uporabi pri pacientih, pri katerih je bila opravljena kateterizacija srca z uvajalom 7 Fr. Primarna končna točka študije je bilo zbrati podatke o času do hemostaze in času do hoje brez dodatne kompresije, ročne ali mehanske. Rezultati študije so

pokazali, da je bil srednji čas do hemostaze 57,8 sekunde in da so vsi pacienti po 4 urah počivanja v postelji hodili.

Namen študije iz leta 2009 je bil oceniti novo pakiranje sistema FemoSeal™ VCS. v študijo je bilo vključenih 25 pacientov. Primarna končna točka je bila ugotoviti, ali je uporabnik imel kakršne koli težave s pakiranjem. Uporabniki niso opazili nobenih težav v zvezi z novim pakiranjem sistema FemoSeal™ VCS. v tej študiji so zbirali tudi podatke o času do hemostaze.

Cilj študije iz leta 2022 je bil proaktivno zbiranje podatkov o varnosti in učinkovitosti sistema FemoSeal VCS pri doseganju hemostaze na mestih pristopa skozi skupno femoralno arterijo (CFA) pri resničnih udeležencih, pri katerih so opravili perkutane endovaskularne posege. v študijo je bilo vključenih 230 pacientov. Primarne končne točke za register so uspeh posega (tj. uspešna hemostaza na mestu punkcije) in zmanjšanje števila večjih zapletov (npr. poškodba žil, krvavitev, povezana z mestom pristopa, okužba na mestu pristopa, ponavljajoča se ročna kompresija in nova ipsilateralna akutna ishemija noge, povezana z mestom pristopa). Študija je pokazala, da sistem FemoSeal™ VCS dobro deluje v resničnem okolju in zagotavlja učinkovito hemostazo ter nizko stopnjo zapletov na mestu pristopa pri bolnikih, pri katerih so bili opravljeni periferni endovaskularni posegi. Dokazuje dobro učinkovitost s kratkim časom do hemostaze in dobrimi povratnimi informacijami uporabnikov o uporabnosti, zaradi česar je FemoSeal™ VCS dragocen pripomoček za zapiranje na mestu femoralnega pristopa.

### 1.4.3 Povzetek podatkov iz kliničnega spremljanja po dajanju na trg

#### 1.4.3.1 Zaključeno klinično spremljanje po dajanju na trg

Povzetek izvedenih dejavnosti kliničnega spremljanja po dajanju na trg je naveden v preglednici 1.7 spodaj.

**Preglednica 1.7. Dejavnosti kliničnega spremljanja po dajanju na trg**

Družba Terumo Medical Corporation je v trenutnem obdobju poročanja (od 1. septembra 2019 do 31. avgusta 2024) izvedla tri visokokakovostne uporabniške ankete med zdravniki.

V kliničnih anketah o pripomočku FemoSeal™ so bili zbrani proaktivni klinični podatki o varnosti in učinkovitosti sistema FemoSeal™ VCS med klinično uporabo. Anketa je vključevala vprašanja o celotnem pripomočku in pripadajočih dodatkih, vključno z 0,038-palčno vodilno žico, ter njihovih neposrednih interakcijah. v kliničnih anketah o vodilni žici so bili zbrani proaktivni klinični podatki o varnosti in učinkovitosti 0,038-palčne vodilne žice, priložene sistemu FemoSeal™ VCS, med klinično uporabo. Vprašanja v anketi so bila osredotočena zlasti na splošno uporabo vodilne žice, od vstavitve skozi žilno uvajalo v ožilje do odstranitve žice.

Sistem FemoSeal™ VCS in 0,038-palčna vodilna žica, priložena pripomočku, sta dobila vse sprejemljive ocene in za pripomoček je bilo predloženih šest (6) pritožb, za vodilno žico pa devet (9) poročil brez pritožb, in sicer na podlagi ocene pripomb, prejetih iz visokokakovostnih kliničnih anket. Obravnavane so bile tako pritožbe glede pripomočka FemoSeal kot tudi pritožbe glede vodilne žice in vse pritožbe so bile ocenjene v okviru postopka nadzora po dajanju na trg družbe Terumo. Ugotovljenih ni bilo nobenih novih tveganj ali stopenj tveganja.

V okviru dejavnosti PMCF je bila leta 2024 izvedena uporabniška anketa med zdravniki. Rezultati ankete so pokazali, da je bila ocena učinkovitosti in varnosti sistema FemoSeal™ VCS na splošno zelo ugodna. Dokazana je bila tudi združljivost z drugimi vodilnimi žicami, ki niso standardno priložene sistemu FemoSeal™ VCS.

#### **1.4.3.2 Tekoče/načrtovano klinično spremljanje po dajanju na trg**

TMC izvaja/načrtuje eno dejavnost kliničnega spremljanja po dajanju na trg. Izvedena bo klinična anketa za prospektivno zbiranje povratnih informacij v zvezi z uporabo vodilne žice s sistemom FemoSeal VCS, ki se distribuira na trgu EU. Anketa bo potekala med zdravniki za ugotavljanje, katere vodilne žice so uporabili med posegom. Namen te ankete je obravnavati vrzel, ki je bila ugotovljena zaradi pomanjkanja literature in komentarjev zunanjih pregledovalcev glede združljivosti sistema FemoSeal™ VCS z uporabo vodilnih žic drugih blagovnih znamk, ki niso blagovne znamke družbe Terumo. Povratne informacije vključujejo tehnične rezultate, klinično učinkovitost in varnost v zvezi z učinkovitostjo pripomočka pri uporabi skupaj z različnimi vodilnimi žicami.

#### **1.4.4 Povzetek podatkov iz sistematičnega pregleda literature**

Družba Terumo Medical Corporation izvaja sistematične preglede literature za zbiranje ter ocenjevanje podatkov o klinični varnosti in učinkovitosti iz objavljenih študij o sistemu FemoSeal™ VCS in/ali podobnih pripomočkih. Namen letnega pregleda objavljene literature je ugotavljanje prej neznanih neželenih učinkov, spremljanje znanih neželenih učinkov, prepoznavanje nastalih tveganj ter morebitnih sistematičnih zlorab ali neodobrene uporabe sistema FemoSeal™ VCS.

Pri zadnjem sistematičnem pregledu literature, ki je zajemal obdobje od 1. septembra 2019 do vključno 31. avgusta 2024, je bilo najdenih 29 objavljenih študij, ki so vsebovale podatke o klinični varnosti in učinkovitosti sistema FemoSeal™ VCS. v triindvajsetih referencah so poročali o odobreni uporabi sistema FemoSeal™ VCS, v devetih študijah pa so poročali o neodobreni uporabi. Na splošno pregled literature o študijah, specifičnih za uporabo sistema FemoSeal™ VCS kaže, da je preučevana populacija reprezentativna za paciente v EU, pri katerih so potrebni posegi perkutane žilne kateterizacije. Za seznam teh 23 strokovno pregledanih publikacij o odobreni uporabi glejte **Razdelek 3**.

Klinična učinkovitost je bila ocenjena po naslednjih merilih:

- Čas do hemostaze je boljši ali primerljiv z zadnjim stanjem tehničnega razvoja na področju perkutane zapiranja skupne femoralne arterije.
- Čas do hoje je boljši ali primerljiv z zadnjim stanjem tehničnega razvoja na področju perkutane zapiranja skupne femoralne arterije.
- Stopnja pooperativnih zapletov je primerljiva ali nižja od trenutnih standardov oskrbe.

Na podlagi teh kliničnih meril učinkovitosti so podatki iz tega pregleda literature pokazali, da se sistem FemoSeal™ VCS lahko uspešno uporablja za zaprtje femoralne arterijske punkcije (arteriotomije) pri pacientih, pri katerih je bila opravljena perkutana kateterizacija z uporabo žilnega uvajala 7 Fr ali manjšega. Popolna hemostaza je bila dosežena pri večini obravnavanih pacientov (79,65–100 %) in je bila povezana s srednjim časom do hemostaze 0,5 minute, povprečni čas do odpusta iz bolnišnice pa je bil 3 dni. 69,2–86,7 % pacientov je bilo sposobnih hoje 5 ur po zaprtju, povprečni pooperativni počitek v postelji pa je bil 349 minut. Pri 3,68–4 % primerov so opazili odpoved sistema FemoSeal™ VCS, pri 0,9–4,4 % posegov pa je bila potrebna dodatna ročna kompresija.

Klinična varnost je bila ocenjena na podlagi neželenih dogodkov, med katerimi so bili:

- krvavitev,
- hematoma,
- psevdoanevrizma,
- modrica,
- arteriovenska fistula,
- okužba,
- smrt.

Pri vsakem od teh neželenih dogodkov je bila stopnja pojavljanja, o kateri so poročali pri sistemu FemoSeal™ VCS v vključenih študijah, nižja ali primerljiva s tistimi, o katerih so poročali v preteklosti pri ročni kompresiji in drugih žilnih zapirilih.

Pri pregledu 10 poročil o primerih ni bilo ugotovljenih neželenih dogodkov, saj ni bilo ugotovljenih nobenih novih, nepredvidenih, nastajajočih ali nesprejemljivih tveganj.

Splošna učinkovitost uporabe sistema FemoSeal™ VCS pri diagnostični angiografiji ali intervencijskih posegih je odvisna od več dejavnikov, kot so: spol, starost, anatomija bolnika, sočasne bolezni, anatomska umestitev mesta punkcije, izkušnje kirurga, način namestitve pripomočka VCD, pooperativna nega ipd. Poleg tehnične uspešnosti, vključno z doseganjem hemostaze, sistem FemoSeal™ VCS v primerjavi z žilnim zaprtjem po punkciji femoralne arterije zagotavlja tudi klinične koristi, kot sta krajši čas do hemostaze in krajši čas do hoje. Rezultati o učinkovitosti sistema FemoSeal™ VCS so skladni s tistimi, ki so predvideni pri tej vrsti pripomočka, če se sistem uporablja v skladu s predvideno uporabo. Nekatere reference, pridobljene med trenutnim obdobjem iskanja, so pokazale uporabo zadevnega pripomočka na anatomske mestu, ki ni skupna femoralna arterija, in za zapiranje arteriotomij > 7 Fr, kar se šteje za neodobreno uporabo.

Med pregledom niso bili ugotovljeni nobeni neznani neželeni učinki, nastala tveganja ali možna sistematična zloraba pripomočka. Če sistem FemoSeal™ VCS previdno uporabljajo usposobljeni zdravniki, medicinski pripomoček deluje kot koristen in potreben klinični pripomoček. Na splošno ciljno zdravljenje in s tem sistem FemoSeal™ VCS izpolnjujeta klinično potrebo, ki trenutno obstaja pri zdravljenju zapletov, povezanih z žilnim pristopom.

Na splošno podatki iz tega pregleda literature niso pokazali nobenih predhodno neznanih težav z učinkovitostjo ali varnostjo pripomočka v kliničnem okolju ali neželenih učinkov, ki bi se pojavljali v večjem obsegu od pričakovanega/sprejemljivega. Zato lahko na podlagi tega pregleda literature sklepamo, da sistem FemoSeal™ VCS pri uporabi za kompresijo za doseganje hemostaze na mestu arteriotomije po perkutani kateterizaciji še naprej deluje po pričakovanih in ni povezan z resnimi dogodki varnosti.

#### **1.4.5 Povzetek podatkov iz nadzora po dajanju na trg**

Vzpostavljen je proaktivni sistem PMS, vse pritožbe pa so mesečno pregledane v skladu z internimi proizvodnimi postopki. Analizirani so bili podatki o pritožbah v časovnem obdobju od 1. septembra 2019 do 31. avgusta 2024. Skupno je bilo proizvajalcu predloženih 28 poročil o vigilanci medicinskih pripomočkov (MDV) in 476 poročil o pritožbah kupcev. Od 28 poročil o MDV je bilo 27 povezanih z neželenimi dogodki, eden pa z okvaro pripomočka. v obdobju poročanja sta bila dva primera s smrtnim izidom, vendar ni bilo presojeno, da je kateri od poročenih primerov s smrtnim izidom povezan z zadevnim pripomočkom. Med 476 pritožbami, naslovljenimi na proizvajalca, so bile najpogostejši razlog za pritožbe težave pri namestitvi (146 primerov, stopnja pojavljanja 0,0142 %). Druga najpogostejša vrsta okvare so dogodki izvleka s stopnjo 0,0126 % (130 dogodkov).

Sistem žilnega zapirala FemoSeal™ Vascular Closure System je bil prodan v več kot 1 030 136 primerkih po vsem svetu in 827 843 primerkih v Evropskem gospodarskem prostoru. Izračunana pogostost pritožb na podlagi globalne prodaje je 0,046 %. Skupna stopnja pritožb kupcev je zelo

nizka. Ugotovljena niso bila nobena nova tveganja, ki še ne bi bila vključena v navodila za uporabo in dokumentacijo o tveganjih.

Stopnje pojavljanja neželenih stranskih učinkov so prikazane v **preglednici 1.2.** v pritožbah ni bilo ugotovljenih nobenih novih nepričakovanih, nastajajočih ali nesprejemljivih tveganj. Ni bilo pomembnega povečanja pogostnosti ali resnosti znanih neželenih stranskih učinkov.

#### 1.4.6 Splošni povzetek o klinični učinkovitosti in varnosti

Sistem FemoSeal™ VCS je indiciran za uporabo pri zapiranju skupne femoralne arterijske punkcije (arteriotomije) pri pacientih, pri katerih je bila opravljena perkutana kateterizacija z uporabo žilnega uvajala 7 Fr (2,33 mm) ali manjšega. To klinično vrednotenje temelji na celoviti analizi razpoložljivih kliničnih podatkov in literature pred dajanjem na trg in po njem, ki so pomembni za predvideno uporabo sistema Femoseal™ VCS.

Celovit pregled objavljene literature je bil opravljen za obdobje od 1. septembra 2019 do vključno 31. avgusta 2024. Sklop dokazov je vključeval 29 študij za sistem FemoSeal™ VCS. Dokazi, navedeni v kliničnem vrednotenju, kažejo, da je zadevni pripomoček varen in učinkovit, če se uporablja v skladu z indikacijami, in da vsa tveganja ali neželeni stranski učinki, ki so lahko povezani s pripomočkom pri običajnih pogojih uporabe, predstavljajo sprejemljiva tveganja v primerjavi s koristmi za pacienta. Rezultati o učinkovitosti zadevnih pripomočkov so skladni s tistimi, ki so predvideni pri tej vrsti pripomočka, če se zadevni pripomočki uporabljajo v skladu s predvideno uporabo.

Možni neželeni stranski učinki, povezani z uporabo sistema FemoSeal™ VCS, vključujejo neželene dogodke, o katerih pogosto poročajo pri alternativnih načinih zapiranja arteriotomij, npr. krvavitev in hematov. Na splošno so stopnje pojavljanja neželenih dogodkov, o katerih so poročali pri uporabi sistema FemoSeal™ VCS, podobne tistim, o katerih so poročali pri ročni kompresiji in podobnih žilnih zapirilih. Zlasti pri krvavitvah in hematomih so stopnje pojavljanja, o katerih so poročali pri uporabi sistema FemoSeal™ VCS, nižje od tistih, o katerih so poročali pri podobnih žilnih zapirilih. Vsi neželeni dogodki, o katerih so poročali v objavljeni literaturi in pri nadzoru po dajanju na trg, so bili ugotovljeni že pred tem (glejte **razdelek 1.3**).

Obstoječi podatki o klinični varnosti in učinkovitosti sistema FemoSeal VCS kažejo, da koristi za paciente zaradi uporabe tega žilnega zapirala odtehtajo morebitna tveganja, če se pripomoček uporablja v skladu z navodili za uporabo.

Kot je navedeno v prejšnjih razdelkih zgoraj, podatki o sistemu FemoSeal™ VCS izkazujejo doslednost med podatki, povezanimi s pripomočkom v postopku vrednotenja (npr. uporaba pripomočka, rezultati glede varnosti, klinična učinkovitost in klinične koristi), ter podatki, povezanimi s prepoznanimi enakovrednimi pripomočki in podobnimi pripomočki, navedenimi pod »Zadnje stanje tehničnega razvoja«.

Pri medsebojni analizi podatkov glede varnosti ni bilo ugotovljenih nobenih vrzeli med:

- podatki, navedenimi pod »Zadnje stanje tehničnega razvoja«;
- podatki glede pripomočka v postopku vrednotenja;
- podatki, navedenimi v Dokumentaciji o upravljanju tveganja;
- podatki, navedenimi na oznaki in/ali v navodilih za uporabo (tj. obravnavana so preostala tveganja, o katerih je treba obvestiti uporabnika).

Klinična varnost je bila dokazana z nizko stopnjo zapletov, ugotovljeno v objavljeni strokovno pregledani klinični literaturi, v kliničnih študijah, ki jih je sponzorirala družba in ob pregledu podatkov po dajanju na trg, pri čemer tudi ni bilo umika s trga. Ugotovljenih ni bilo nobenih pomislekov glede učinkovitosti, pregledana literatura pa je navajala, da je uporaba sistema FemoSeal™ VCS skladna z uporabo, kakor jo je predvidel proizvajalec.

### 1.5 Možne diagnostične ali terapevtske alternative

Za doseganje hemostaze na mestu arteriotomije po žilni kateterizaciji se tradicionalno uporablja ročna kompresija. Ročna kompresija je povezana z dolgotrajno imobilizacijo pacienta (do 8 ur po posegu) ter s precejšnjim nelagodjem in podaljšano hospitalizacijo. Nedavni sistematični pregled je pokazal, da je srednji čas do dosežene hemostaze z ročno kompresijo znašal 20,8 minute.<sup>1</sup>

Alternativa ročni kompresiji so zunanji hemostatski pripomočki za mehansko kompresijo mesta arteriotomije. Ti pripomočki ne skrajšajo časa do hemostaze ali časa do hoje, temveč zmanjšajo potrebo po osebju, saj nadomestijo ročno kompresijo z mehansko kompresijo. Stopnja neželenih dogodkov, povezanih z mehansko kompresijo, je podobna kot pri ročni kompresiji.

Žilna zapirala, kot je FemoSeal™ VCS, so zasnovana za zapiranje arteriotomije. Njihov cilj je skrajšati čas do hemostaze in omogočiti zgodnejšo hojo. Pri nedavnem sistematičnem pregledu, ki je vključeval 13 na trgu dostopnih pripomočkov, je bilo ugotovljeno, da je srednji čas do dosežene hemostaze z žilnim zapiralom 5,4 minute. Srednji čas do hemostaze pri posameznih žilnih zapirilih je bil od 1 minute (FemoSeal™ VCS) do 14 minut, pri večini pripomočkov pa od 4 do 10 minut.<sup>1</sup>

Pogosto poročani neželeni dogodki, povezani z zapiranjem mesta arteriotomije z ročnimi kompresijami, zunanjimi hemostatičnimi pripomočki ali žilnimi zapirali, vključujejo hematoma, krvavitev na mestu pristopa, psevdoanevrizmo, arteriovensko fistulo in okužbo. Isti sistematični pregled (34 randomiziranih nadzorovanih preskušanj, pri 14 401 bolnikih) je pokazal, da so bile pogostnosti neželenih dogodkov pri ročni kompresiji in uporabi žilnih zapiral podobne, razen da so bile pri žilnih zapirilih krvavitve nekoliko pogostejše.<sup>1</sup>

## 1.6 Predlagani profil uporabnika in usposabljanje

Predvideni uporabniki sistema žilnega zapirala FemoSeal™ Vascular Closure System so zdravniki, ki so usposobljeni za izvajanje arterijskega pristopa in zapiranja pri endovaskularnih posegih skozi skupno femoralno arterijo in so se udeležili programa usposabljanja zdravnikov za uporabo pripomočkov FemoSeal™ družbe Terumo Medical Corporation.

## 1.7 Ustrezni usklajeni in skupni standardi

Ovaj Rezime bezbednosti i kliničkih performansi (SSCP) treba da pruži javni pristup ažuriranom sažetku glavnih aspekata bezbednosti i kliničkih performansi sredstva FemoSeal™ Vascular Closure System (VCS).

Rezime bezbednosti i kliničkih performansi sredstva, namenjen korisnicima / zdravstvenim radnicima, dat je u nastavku u **odeljku 1.0**.

## **1.0 REZIME ZA KORISNIKE / ZDRAVSTVENE RADNIKE**

Nije predviđeno da SCP zameni Uputstvo za upotrebu kao glavni dokument koji će osigurati bezbednu upotrebu sredstva niti je predviđeno da pruži dijagnostičke i terapijske sugestije predviđenim korisnicima ili pacijentima. Nije predviđeno da SSCP zameni obavezne informacije na karticama za implantat ili bilo koje druge obavezne dokumente.

### **1.1 Namena sredstva**

#### **1.1.1 Namena**

FemoSeal™ Vascular Closure System je medicinsko sredstvo namenjeno za zatvaranje arterijske punkcije nakon perkutane kateterizacije kroz zajedničku femoralnu arteriju.

#### **1.1.2 Indikacije za upotrebu**

FemoSeal™ Vascular Closure System je indikovano za upotrebu u zatvaranju punkcije zajedničke femoralne arterije (arteriotomije) kod pacijenata koji su podvrgnuti perkutanoj kateterizaciji sa košuljicom za sprovođenje procedure ne većom od 7 F (2,33 mm).

#### **1.1.3 Kontraindikacije i/ili ograničenja**

FemoSeal™ Vascular Closure System je kontraindikovano kod pacijenata sa arteriotomijama kod koji se koriste košuljice ili sredstva veći od 7 F (2,33 mm).

#### **1.1.4 Ciljne populacije pacijenata**

Bezbednost i delotvornost sredstva FemoSeal™ Vascular Closure System utvrđene su kod pacijenata od najmanje 18 godina starosti koji su podvrgnuti perkutanoj kateterizaciji sa košuljicom za sprovođenje procedure ne većom od 7 F (2,33 mm).

#### **1.1.5 Posebne populacije pacijenata**

Bezbednost i delotvornost sredstva FemoSeal™ Vascular Closure System nisu utvrđene kod sledećih populacija pacijenata:

- Pacijenti sa postojećim autoimunim oboljenjem.
- Pacijenti koji su podvrgnuti terapijskoj trombolizi.
- Pacijenti sa klinički značajnim perifernim vaskularnim oboljenjem.
- Pacijenti sa hipertenzijom (> 220 mmHg sistolni ili > 110 mmHg dijastolni) koja nije pod kontrolom.
- Pacijenti sa poremećajem krvarenja, uključujući trombocitopeniju (< 100.000 trombocita) ili anemiju (Hgb < 10 mg/dl).

- Pacijenti koji imaju unutrašnji lumen zajedničke femoralne arterije manji od 5 mm.
- Pacijenti sa renalnom i/ili hepatičnom insuficijencijom.
- Pacijenti sa drugim relevantnim komorbiditetom.
- Populacija specifičnog rasnog i/ili etničkog porekla.
- Pacijenti sa infarktom miokarda u periodu od 72 sata.
- Pacijenti sa vaskularnim graftom ili stentom na mestu punkcije.
- Pacijenti u drugom stanju ili laktaciji.
- Pacijenti mlađi od 18 godina.

### 1.1.6 Predviđeni korisnici

Predviđeni korisnici sredstva FemoSeal™ Vascular Closure System su lekari sa obukom koja ih kvalifikuje za izvođenje arterijskog pristupa i zatvaranja kod endovaskularnih procedura preko zajedničke femoralne arterije i koji učestvuju u programu za obuku lekara za FemoSeal™ kompanije Terumo Medical Corporation.

## 1.2 Opis sredstva

### 1.2.1 Opis sredstva

FemoSeal™ Vascular Closure System, koji proizvodi kompanija Terumo Medical Corporation (TMC), je resorptivno vaskularno sredstvo za zatvaranje dizajnirano za postizanje hemostaze femoralne arterije nakon perkutane kateterizacije kroz zajedničku femoralnu arteriju.

FemoSeal™ elementi za zatvaranje sastoje se od dva resorptivna polimerna diska, unutrašnje zaptivke i spoljašnjeg diska za fiksiranje, koje spaja resorptivni multifilament čime se arteriotomija zatvara mehanički (pogledajte **sliku 1.1** i **sliku 1.2**). Nakon postavljanja kroz košuljicu konusnog kućišta, spoljašnji disk za fiksiranje se potiskuje na multifilamentnu osovinicu što dovodi do mehaničkog zatvaranja mesta punkcije između unutrašnjeg i spoljašnjeg diska za fiksiranje. Unutrašnju zaptivku i spoljni disk za fiksiranje na mestu drži frikcija na multifilamentnoj osovinici. Hemostaza se postiže mehaničkim sredstvima. Elementi za zatvaranje se razgrađuju hidrolizom.

Implantabilne komponente za zatvaranje, unutrašnja zaptivka i spoljašnji disk za fiksiranje razgrađuju se u roku od osamnaest (18) meseci, dok se procenjuje da okolno tkivo razgrađuje i resorbuje multifilament nakon dve (2) do tri (3) godine. Sposobnost implantabilnih komponenta za zatvaranje da održe kompresiju na arteriotomiji je ispitana na najviše osam (8) sati. Proizvodi razgradnje se metabolišu i izlučuju kroz urin ili izbacuju kao ugljen-dioksid preko pluća. U

studijama na životinjama nisu uočeni efekti akumulacije. Dodatne komponente sredstva FemoSeal™ koje će doći u kontakt sa živim tkivom ili krvlju u toku procedure su košuljica konusnog kućišta, dilatator, cevčica za potiskivanje, potiskivač i žica vodič.

**Slika 1.1 Unutrašnja zaptivka i spoljašnji disk za fiksiranje, sleva nadesno**

**Slika 1.2 Postavljeni unutrašnja zaptivka i spoljašnji disk**

FemoSeal™ jedinica se pakuje zajedno sa dilatatorom i žicom vodičem spoljašnjeg prečnika 0,038" (0,97 mm), dužine 27,5" (70 cm) i ispravljačem J-oblika, videti **sliku 1.3** u nastavku. Žica vodič se nalazi u polietilenskoj cevčici. Svi delovi su upakovani na fiksnoj papirnoj tacni. Pakovanje takođe sadrži karticu za implantat za pacijenta. FemoSeal™ Vascular Closure System ne zahteva dodatni pribor da bi sredstvo funkcionisalo kao što je predviđeno i sredstvo je namenjeno samo za upotrebu sa dilatatorom i žicom vodičem koji su priloženi u pakovanju proizvoda.

\* Implantabilan deo sredstva; implantabilne komponente su bezbedne za MR snimanje

FemoSeal™ VCS se sterilise etilen-oksidiom (EO) i predstavlja medicinsko sredstvo za jednokratnu upotrebu. FemoSeal™ VCS sredstvo je dizajnirano tako da ne može da se koristi više puta.

### **Način delovanja**

FemoSeal™ VCS unapređuje mehaničku hemostazu razvijanjem implantabilnih elemenata za zatvaranje unutar i izvan zajedničke femoralne arterije. Unutrašnja zaptivka koja zaptiva mesto punkcije i spoljašnji disk za fiksiranje koji drži unutrašnju zaptivku na mestu obezbeđuju mehanizam koji sprečava krvarenje.

### **1.2.3 Klinička korist**

FemoSeal™ VCS pruža sledeće kliničke koristi u pogledu vaskularnog zatvaranja nakon punkcije zajedničke femoralne arterije:

- Skraćeno vreme do hemostaze<sup>1</sup>
- Skraćeno vreme do ambulacije<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Prethodna generacija/generacije ili varijante

- Prva verzija FemoSeal™ VCS (br. 11200) prodavala se na evropskom tržištu u toku 2005. godine i delu 2006.
- Aktuelna verzija FemoSeal™ VCS (br. 11202), sa unapređenim sistemom dovoda, na tržištu je od 28. marta 2006. godine.

#### 1.2.5 Dodatni pribor predviđen za upotrebu u kombinaciji sa sredstvom

FemoSeal™ jedinica se pakuje zajedno sa dilatatorom, žicom vodičem spoljašnjeg prečnika 0,038" (0,97 mm), dužine 27,5" (70 cm) i ispravljačem J-oblika. Žica vodič je dodatni pribor jedinice FemoSeal™. Ispravljač J-oblika je komponenta žice vodiča, dok je dilatator komponenta jedinice FemoSeal™. Žica vodič je jedini dodatni pribor koji se razmatra. Žica vodič se nalazi u polietilenskoj cevčici. Svi delovi su upakovani na fiksnoj papirnoj tacni. Pakovanje takođe sadrži karticu za implantat za pacijenta. FemoSeal™ Vascular Closure System ne zahteva dodatni pribor da bi sredstvo funkcionisalo kao što je predviđeno i sredstvo je namenjeno samo za upotrebu sa dilatatorom i žicom vodičem koji su priloženi u pakovanju proizvoda.

#### 1.2.6 Druga sredstva i proizvodi predviđeni za upotrebu u kombinaciji sa sredstvom

Sredstvo FemoSeal™ VCS ne zahteva dodatna sredstva da bi funkcionisalo kao što je predviđeno.

### 1.3 Rizici i upozorenja

#### 1.3.1 Rezidualni rizici i neželjena dejstva

Poznati ili predvidivi neželjeni događaji, povrede i komplikacije koji se povezuju sa upotrebom sredstva FemoSeal™ VCS kao posledica rezidualnog rizika navedeni su u **tabeli 1.2**. Stopa javljanja je zasnovana na analizi dokumentacije o rizicima i izračunata na osnovu podataka o praćenju nakon plasiranja na tržište od 1. septembra 2019. godine do 31. avgusta 2024. godine. Nema nepoznatih rezidualnih rizika za FemoSeal™ VCS i svi primenljivi rizici su razmatrani kroz Uputstvo za upotrebu i proces upravljanja rizicima.

**Tabela 1.2. FemoSeal neželjeni događaji / komplikacije**

| Šteta                                               | Stopa javljanja (%) | Ublažujući faktori                                                                                                                          |

### 1.3.2 Upozorenja i mere predostrožnosti

#### Upozorenja

1. Nemojte koristiti ako je pakovanje oštećeno ili ako sterilna barijera nije očuvana.
2. Nemojte koristiti nakon isteka roka upotrebe – biorazgradive komponente možda neće imati adekvatan učinak.
3. Nemojte koristiti ako bilo koji elementi deluju oštećeno ili neispravno na bilo koji način.
4. Upotreba sredstva FemoSeal™ Vascular Closure System na mestu na kome je možda došlo do bakterijske kontaminacije košuljice za obavljanje procedure ili okolnog tkiva može izazvati infekciju.
5. Ako postoji sumnja da je posteriorni zid arterije probušen ili da je napravljeno više arterijskih punkcija, nemojte se oslanjati isključivo na FemoSeal™ Vascular Closure System za postizanje arterijske hemostaze. Primenite dodatnu ručnu ili mehaničku kompresiju.
6. Ako je mesto punkcije na bifurkaciji ili distalno u odnosu na bifurkaciju femoralne arterije, FemoSeal™ Vascular Closure System ne treba koristiti zbog rizika od nepravilnog pozicioniranja unutrašnje zaptivke. To može dovesti do komplikacija sa krvarenjem i/ili disrupcije normalnog protoka krvi.
7. Ako postoji uporno arterijsko krvarenje na mestu reza, ne secite multifilament dok se ne postigne hemostaza. Ako se hemostaza ne postigne, pričvrstite multifilament sterilnom kompresom i primenite dopunsku kompresiju dok se ne postigne hemostaza. U slučaju upornog arterijskog krvarenja, mogu da se jave značajne komplikacije sa krvarenjem što može da dovede do povrede ili smrti pacijenta.
8. Nemojte koristiti FemoSeal™ Vascular Closure System ako je mesto punkcije proksimalno u odnosu na ingvinalni ligament, jer ovo može da dovede do retroperitonealnog hematoma.
9. Pacijenti sa povišenim rizikom od krvarenja mogu da pretrpe povećan gubitak krvi koji zahteva transfuziju.
10. Ako se unutrašnji disk odvoji, to potencijalno može izazvati trombotski i/ili embolijski događaj.

#### Mere predostrožnosti

1. Proceduru postavljanja sredstva FemoSeal™ Vascular Closure System treba da urade lekari sa adekvatnom obukom za upotrebu sredstva.
2. Uradite ograničeni femoralni angiogram ili femoralnu punkciju vođenu ultrazvukom pre nego što postavite FemoSeal™ Vascular Closure System.

3. Obustavite proceduru u sledećim slučajevima:
  - Prečnik lumena zajedničke femoralne arterije < 5 mm.
  - Stenoza i/ili znatan plak prisutni u blizini mesta punkcije zajedničke femoralne arterije.
  - Arterijska punkcija je na bifurkaciji femoralne arterije ili distalno u odnosu na nju.
  - Nepravilne grane ili abnormalnosti krvnog suda prisutni u blizini mesta punkcije zajedničke femoralne arterije.
4. Ako postoji hematoma, mora se posebno obratiti pažnja na pravilno uvođenje košuljice konusnog kućišta u arteriju.
5. Primenite tehniku jedne punkcije zida. Ne punktirajte posteriorni zid arterije.
6. Uvek se pridržavajte sterilne tehnike kada koristite FemoSeal™ Vascular Closure System.
7. FemoSeal™ Vascular Closure System je samo za jednokratnu upotrebu i ne treba ga nikako ponovo sterilisati ili koristiti. Jedinica FemoSeal™ je dizajnirana tako da ne može da se koristi ponovo.
8. Ako tokom postavljanja unutrašnje zaptivke naidete na neočekivan otpor, obustavite proceduru.
9. Za pravilno postavljanje unutrašnje zaptivke ponovo postavite palac tako da dugme može slobodno da se vrati i prvobitni položaj.
10. Postarajte se da košuljica konusnog kućišta jedinice FemoSeal™ bude ispod površine kože pre postavljanja spoljašnjeg diska za fiksiranje. Spoljašnji disk za fiksiranje može nenamerno da se postavi iznad nivoa kože kod pacijenata sa malim rastojanjem između femoralne arterije i nivoa kože.
11. Da bi postavljanje bilo pravilno, može biti neophodno da se pre postavljanja na koži napravi rez.
12. Ako je unutrašnja zaptivka je unutar arterije, ali nije moguće potpuno pritisnuti dugme i postaviti spoljašnji disk za fiksiranje, te će hirurg možda morati da ukloni FemoSeal™ elemente za zatvaranje.
13. Ako postane neophodna ponovna punkcija iste femoralne arterije u roku od 18 meseci, ponovna punkcija bi trebalo da se uradi najmanje jedan centimetar proksimalno u odnosu na prethodno mesto pristupa sredstva FemoSeal™ Vascular Closure System.
14. Uputite pacijenta da se pridržava uputstava lekara u vezi sa proverom mesta zatvaranja.

15. Uputite pacijenta da nosi sa sobom Karticu za implantat za pacijenta u narednih 18 meseci

### **Mere predostrožnosti u vreme otpuštanja**

Pre nego što razmotrite otpuštanje, procenite sledeća klinička stanja kod pacijenta:

1. Krvarenje i/ili hematoma na mestu zatvaranja.
2. Bol u toku hodanja.
3. Znaci infekcije na mestu zatvaranja.

### **1.3.3 Bezbednosne korektivne radnje na terenu**

Postojala je jedna bezbednosna korektivna radnja na terenu u vezi sa FemoSeal™ VSC u periodu od 1. septembra 2019. do 31. avgusta 2024. godine.

U 2022. godini, kompanija Terumo dobrovoljno je opozvala FemoSeal™ VCS zbog žalbi koje su se odnosile na neuspehe u testiranju procesa i predstavljanja serije proizvoda FemoSeal za merenje sile potiskivanja i sile retrakcije koju je proizvela kompanija Elkton. Ukupno je povučeno 950 jedinica iz Južne Koreje.

### **1.4 Rezime kliničke evaluacije i kliničkog praćenja nakon plasiranja na tržište**

**Tabela 1.3** sadrži listu pivotalnih studija koje su sprovedene da bi se FemoSeal™ VCS plasirao na tržište, kao i studija sprovedenih nakon plasiranja na tržište i aktivnostima u kliničkom praćenju nakon plasiranja na tržište. Verzija sredstva korišćena u studiji navedena je u tabeli u nastavku. Prva verzija FemoSeal™ VCS (br. 11200) je bila na tržištu do 2006. godine, dok je sledeća verzija (br. C11202) plasirana na tržište 2006. i trenutno se nalazi na tržištu.

**Tabela 1.3 Rezime pivotalnih studija**

| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | 2002. Radi Medical System AB Sproveo Biomatech, Francuska | Studija na životinjama | Svrha studije je bila procena biokompatibilnosti i biofunktionalnosti biorazgradivog materijala dizajniranog za postizanje hemostaze u vaskularnom sistemu. Predviđeno je da ispitano sredstvo uđe u otvor punkcije u arterijama da bi se postigla hemostaza. Jedan disk je ušao u otvor punkcije u arteriji, a drugi je zategao unutrašnji disk sa spoljašnje strane arterije. Oba diska su umetnuta kroz košuljicu uvodnika. Diskovi su dizajnirani da spreče krvarenje, zarastu u zid krvnog suda i da se na kraju razlože i resorbuju. Studija je dizajnirana za sakupljanje i analiziranje podataka nakon funkcionalne implantacije kod ovaca i svinje radi procene kapaciteta implantata da održi fiziološku funkciju kada se koristi u cirkulatornom sistemu, da bi se utvrdili reagovanje domaćina i reagovanje sredstva (fizički integritet, tkivna enkapsulacija u žrtvovanju) i da bi se procenilo razlaganje implantata | Period implantacije / praćenje je 5 nedelja za sve životinje<br><br>4 ovce, 1 svinja<br><br>14 elemenata za zatvaranje<br><br>8 elemenata za zatvaranje implantiranih u 2 ovce,<br><br>2 elementa za zatvaranje implantirana u 1 svinju<br><br>Kada su dva elementa za zatvaranje implantirana u istu femoralnu arteriju, implantirani su na rastojanju od > 30 mm | Nisu zabeleženi kriterijumi za neželjene znake (inflamacija, nekroza, krvarenje ili bilo koja druga lezija) ni bilo kakvo formiranje tankog pseudointimalnog sloja. Naročita pažnja je posvećena početnoj tkivnoj integraciji sredstva, uz poseban akcenat za enkapsulaciju unutrašnjeg diska.<br><br>Makroskopski, nisu uočeni značajni znaci lokalne intolerancije ili formiranja tromba. Makroskopska opservacija nije otkrila razliku između ovce i svinje nakon implantacije elemenata za zatvaranje u femoralnim arterijama. Makroskopski, nisu uočeni značajni znaci lokalne intolerancije ili formiranja tromba. Makroskopska opservacija nije otkrila razliku između ovce i svinje nakon implantacije elemenata za zatvaranje u femoralnim arterijama.<br><br>Histopatološka analiza mesta implantacije kod ovce nije pokazala lokalne neželjene reakcije. Unutrašnji i spoljašnji disk su pokazali znake razlaganja i u nekim slučajevima su bili polomljeni na sitnije delove. Unutrašnji diskovi su potpuno integrisani u neointimalno tkivo. Kod svinje je histopatološka analiza pokazala nešto više inflamatornih znakova oko unutrašnjeg i spoljašnjeg diska. Kod obe životinje |

U okviru plana razvoja pre plasiranja na tržište sredstva FemoSeal™ VCS urađena su 3 funkcionalna ispitivanja na životinjama. U 2000. pre pokretanja kliničkih studija urađena je studija na životinjama radi procene biofunkcionalnosti sredstva FemoSeal™ VCS. Ova studija je procenjivala kapacitet elemenata za zatvaranje da održe fiziološku funkciju i njihovo razlaganje. U 18. mesecu unutrašnji i spoljašnji disk više nisu bili vidljivi, a zamenilo ih je endoluminalno fibrozno tkivo. U zaključku je potvrđen kapacitet FemoSeal™ VCS elementa za zatvaranje da održi fiziološku funkciju kada se koristi u cirkulatornom sistemu.

U 2002. godini je urađena studija na životinjama da bi se procenile biokompatibilnost i biofunktionalnost biorazgradivog implantata, FemoSeal™ VCS, dizajniranog za postizanje hemostaze u vaskularnom sistemu. U sažetku, razlaganje implantata je bilo gotovo okončano do 36. nedelje i nije bilo značajnih neželjenih tkivnih reakcija.

Još jedna studija na životinjama iz 2002. godine procenjivala je biokompatibilnost i biofunktionalnost biorazgradivog implantata, FemoSeal™ VCS, dizajniranog za postizanje hemostaze u vaskularnom sistemu. Nakon 5 nedelja enkapsulacija diska je bila potpuna, a znaci razlaganja su uočeni na unutrašnjem i spoljašnjem disku. U zaključku je potvrđen kapacitet implantata da održi fiziološku funkciju kada se koristi u cirkulatornom sistemu.

U okviru plana kliničkog razvoja sredstva FemoSeal™ VCS, Radi Medical System AB je sproveo kliničko istraživanje pre plasiranja na tržište. Ovo kliničko istraživanje nije objavljeno i nije dostupno na internetu. Studija modela sredstva br. 11200 je sprovedena u periodu 2002–2004. prema evropskom standardu EN 540 (Kliničko istraživanje medicinskih sredstava za ljudske ispitanike) i u skladu sa IHC Opštim pitanjima u vezi sa kliničkim ispitivanjima i Smernicama za dobru kliničku praksu. Detaljni podaci iz ove studije su dokumentovani u sažetku EU-SE-001. Kliničko ispitivanje je dokumentovano u Završnom sažetku Radi Medical Systems AB, „Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures“. Klinička studija je sprovedena sa prvim FemoSeal™ modelom br. 11200 i fokusirala se na bezbednost i delotvornost implantabilnih komponenata za zatvaranje. Jedina razlika između prvog modela br. 11200 i aktuelnog modela, C11202 su frenč veličina, 6 F odnosno 7 F, i unapređen sistem dovoda. Kliničke koristi, namena, principi rada i sirovi materijali implantabilnih sistema za zatvaranje, unutrašnji i spoljašnji disk za fiksiranje su nepromenjeni.

Sredstvo je bilo namenjeno pacijentima koji se podvrgavaju dijagnostičkim kardiološkim i interventnim kardiološkim procedurama sa mestom pristupa preko femoralne arterije. Cilj ove studije bio je da se utvrde bezbednost, performanse i delotvornost sredstva FemoSeal™ VCS. Ovo je bila prospektivna, multicentrična otvorena studija sa jednom grupom i praćenjem u periodu od 30 dana.

Primarni parametar praćenja za performanse je bilo vreme do postizanja hemostaze definisano kao odsustvo jakog krvarenja. Primarni bezbednosni parametar praćenja bio je incidenca ozbiljnih vaskularnih komplikacija u periodu od 30 dana. Sekundarni parametri praćenja obuhvatali su ambulaciju, proporciju neuspešnih lečenja, incidencu neželjenih događaja i karakteristike performansi sredstva tokom dovoda i postavljanja.

Pacijenti obuhvaćeni ovom studijom bili su odrasle osobe koje su mogle da daju informisani pristanak i imaju najmanje jedan očuvani puls na stopalu. Pacijenti su isključivani iz studije ako su imali neko od sledećih stanja:

- Istorija oboljenja perifernih krvnih sudova

- Autoimuna bolest
- Poznat poremećaj krvarenja ili ozbiljna anemija
- INR > 1,5
- Infarkt miokarda u protekla 72 sata
- Nekontrolisana hipertenzija uprkos terapiji
- Gojaznost koja sprečava pristup Seldingerovom tehnikom
- Postojanje vaskularnog grafta ili stenta na mestu arteriotomije
- Ranija ipsilateralna punkcija u periodu od 3 meseca
- Očekivani životni vek < 6 meseci

Osim toga, pacijenti su pregledani intraoperativno i isključivani iz studije ako je uočeno bilo šta od navedenog:

- Prečnik lumena zajedničke femoralne arterije < 5 mm
- Grane arterije 2 cm proksimalno u odnosu na mesto punkcije
- Značajna stenoza u oblasti od 3 cm od mesta punkcije
- Upotreba primarne košuljice uvodnika > 6 Fr
- Punkcija na račvanju femoralne arterije ili distalno u odnosu na njega
- Više femoralnih punkcija
- Poznata ili suspektna punkcija posteriornog zida femoralne arterije
- Veliki hematoma (2:6 cm) po završetku procedure
- Otežano umetanje primarne košuljice za proceduru zbog krivudavog tkiva ili krvnog suda

Ova studija sa jednim protokolom je sprovedena iz dva dela: 20 pacijenata je uključeno u toku Dela 1, zatim je urađena analiza bezbednosti, pa je uključeno još 60 pacijenata u toku Dela 2.

U Delu 1 srednja starosna dob uključenih pacijenata je bila 65,9 godina, 70,0% pacijenata je bilo muškog pola, a 95% pacijenta je istovremeno uzimalo druge lekove. U Delu 2 studije srednja starosna dob je bila 63,8 godina, 78% pacijenata je bilo muškog pola, a 100% njih je istovremeno uzimalo druge lekove.

U studiju su mogli da se uključe pacijenti koji su podvrgnuti dijagnostičkim (Deo 1 i Deo 2) ili interventnim (Deo 2) procedurama kateterizacije srca. Procedure su bile usaglašene sa standardom nege u svakoj od bolnica koje su učestvovala u uključivanju, nakon čega je sledila

primena sredstva FemoSeal™ VCS. Podaci o pacijentima su sakupljeni prilikom početne posete, u toku procedure i 1. i 30. dana nakon procedure. Rezultati su rezimirani u **tabeli 1.5** i pokazuju da je sredstvo FemoSeal™ VCS bezbedno i delotvorno za primenu u ovoj populaciji pacijenata.

**Tabela 1.5 Klinički rezultati prijavljeni u studiji pre plasiranja na tržište**

| Otkazivanja sredstva                                                                                | 0 (0%)      | 6 (10%)                  |

<sup>a</sup>Na osnovu ukupnog uzorka od 58 jer kod 2 pacijenta nije postignuta hemostaza u vreme procedure zbog prethodnih ipsilateralnih punkcija. Hemostaza je kod ovih pacijenata postignuta u 7. i 37. minutu.

<sup>b</sup>Na osnovu ukupnog uzorka od 59: 1 pacijent nije bio uključen jer je stavljen na ventilator zbog plućnog edema i nemogućnosti ambulacije duže od jedne nedelje.

<sup>c</sup>Definisano kao vaskularna komplikacija koja zahteva transfuziju krvi ili hiruršku reparaciju ili lokalna infekcija koja zahteva administraciju antibiotika, hospitalizaciju ili produženu hospitalizaciju ili debridman mesta

U Delu 1 studije nisu uočene ozbiljne vaskularne komplikacije. Prijavljena je 1 ozbiljna vaskularna komplikacija u Delu 2 studije: pseudoaneurizma koja je prijavljena u periodu od 1 dana nakon procedure. Događaj je zahtevao kompresiju vođenu ultrazvukom i injekciju trombina u pseudoaneurizmu i produžetak hospitalizacije pacijenta.

Od 5 neželjenih dejstava prijavljenih u Delu 1 studije, moguće je da je 1 neželjeni događaj bio povezan sa sredstvom: događaj koji se ne smatra ozbiljnim, jako krvarenje 1 dan nakon procedure. Od 19 neželjenih događaja prijavljenih u Delu 2 studije, uočena su 3 neželjena događaja u vezi sa sredstvom koji se ne smatraju ozbiljnim i 6 događaja koji su moguće povezani sa sredstvom i koji se ne smatraju ozbiljnim, uključujući 3 izveštaja o upornom curenju, 2 hematoma i 1 slučaj bola u nozi nakon vežbanja.

Kod 3 pacijenta u Delu 2 smatralo se da je lečenje neuspešno: 2 usled nepostizanja hemostaze bez korišćenja kompresije i 1 usled ozbiljne vaskularne komplikacije (pseudoaneurizme).

U Delu 1 studije nije bilo neuspešnih lečenja.

Od šest otkazivanja sredstva u Delu 2 studije, tri nisu ometala proceduru, jedno je pripisano grešci korisnika, jedno se odnosilo na curenje uvodnika i jedno je bilo prekinut spoj filameta. Poslednja dva problema su rešena unapređenjem modela koje je implementirano u C11202.

Deo 2 kliničke studije pre plasiranja na tržište nije prijavio rezultate praćenja u periodu od 6 meseci zbog neusaglašenosti pacijenata. Rezultati kliničke studije pre plasiranja na tržište (EU-SE-001) za period od 30 dana, koja je u skladu sa periodom praćenja u kliničkoj literaturi, pokazuju da je sredstvo FemoSeal™ VCS bezbedno i delotvorno.

#### 1.4.2 Sažetak podataka iz kliničkih ispitivanja nakon plasiranja na tržište

Postoje 4 završene kliničke studije nakon plasiranja za tržište koje su opisane u tabeli 1.6 u nastavku. Ova klinička istraživanja nisu objavljena i nisu dostupna na internetu.

**Tabela 1.6 Kliničke studije nakon plasiranja na tržište**

| Završene kliničke studije nakon plasiranja na tržište                                       |                                    |                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                              |

Studija iz 2006. godine je sprovedena da bi se potvrdili bezbednost i delotvornost aktuelnog sredstva sa unapređenim sistemom za dovod i za prikupljanje povratnih informacija o Uputstvu za upotrebu sredstva FemoSeal™ VCS i programu obuke. Studija je obuhvatila 100 pacijenata i primarni parametar praćenja je bilo da li je hemostaza postignuta ili su bili potrebni dodatna ručna ili mehanička kompresija. Zaključak ove studije je da je primena sredstva FemoSeal™ VCS bila uspešna u većini slučajeva (91% je postiglo neposrednu hemostazu).

U studiji iz 2008. je učestvovalo 50 pacijenata radi ocene bezbednosti i performansi sredstva FemoSeal™ VCS kada se koristi u uobičajenim kliničkim postupcima kod pacijenata koji se podvrgavaju kateterizaciji srca sa košuljicom od 7 Fr. Primarni parametar praćenja za studiju bio je sakupljanje podataka o vremenu do postizanja hemostaze i vremenu do ambulacije bez dodatne kompresije, ručne ili mehaničke. Rezultati studije su pokazali da je srednje vreme do postizanja hemostaze bilo 57,8 sekundi i da su svi pacijenti ambulirani nakon 4 sata ležanja.

Studija iz 2009. godine je trebalo da proceni novo pakovanje sredstva FemoSeal™ VCS. U studiji je učestvovalo 25 pacijenata. Primarni parametar praćenja bilo je utvrđivanje da li su korisnici imali bilo kakvih problema sa pakovanjem. Korisnici su zabeležili probleme u vezi sa pakovanjem sredstva FemoSeal™ VCS. U ovoj studiji su takođe sakupljeni podaci o vremenu do postizanja hemostaze.

Cilj studije iz 2022. je bio da proaktivno sakupi podaci o bezbednosti i delotvornosti sredstva FemoSeal VCS u postizanju hemostaze mesta pristupa na zajedničkoj femoralnoj arteriji (CFA, engl. common femoral artery) kod stvarnih ispitanika koji se podvrgavaju perkutanim endovaskularnim procedurama. U studiji je učestvovalo 230 pacijenata. Primarni parametri praćenja za registar i uspeh procedure (tj. uspešnu hemostazu mesta punkcije) i smanjenje broja ozbiljnih komplikacija (npr. vaskularne povrede, krvarenje na mestu pristupa, infekcija na mestu pristupa, ponovljena ručna kompresija i ipsilateralna akutna ishemija noge u vezi sa novim mestom pristupa). Studija je zaključila da sredstvo FemoSeal™ VCS dobro funkcioniše u realnim uslovima i pruža efikasnu hemostazu i mali broj komplikacija na mestu pristupa za pacijente koji se podvrgavaju perifernim endovaskularnim intervencijama. Pokazuje dobre performanse sa kratkim vremenom do hemostaze i dobrim povratnim informacijama o dobroj upotrebljivosti za rukovaoca, što FemoSeal™ VCS čini vrednim sredstvom za zatvaranje femoralnog pristupa.

### 1.4.3 Sažetak podataka iz kliničkih praćenja nakon plasiranja na tržište

#### 1.4.3.1 Završeno kliničko praćenje nakon plasiranja na tržište

Sažetak završenih aktivnosti kliničkog praćenja nakon plasiranja na tržište je opisan u **tabeli 1.7** u nastavku.

**Tabela 1.7. Aktivnosti kliničkog praćenja nakon plasiranja na tržište**

Kompanija Terumo Medical Corporation je tokom aktuelnog perioda izveštavanja (1. septembar 2019. – 31. avgust 2024.) završila tri kvalitetne ankete za korisnike lekare.

Kliničke ankete za FemoSeal™ su sakupile proaktivne kliničke podatke u vezi sa bezbednošću i performansama sredstva FemoSeal™ VCS u kliničkoj primeni. Anketa je sadržala pitanja fokusirana uopšteno na sredstvo i povezani dodatni pribor, uključujući žicu vodiča od 0,038” i njihove direktne interakcije. Kliničke ankete u vezi sa žicom vodičem su sakupile proaktivne kliničke podatke u vezi sa bezbednošću i performansama u toku kliničke primene žice vodiča od 0,038” koja se isporučuje sa FemoSeal™ VCS. Pitanja u anketi su bila fokusirana naročito na

opštu primenu žice vodiča od uvođenja kroz košuljicu za izvođenje procedure u vaskulaturu do uklanjanja žice.

FemoSeal™ VCS i žica vodič od 0,038" priložena uz sredstvo su dobili prihvatljive ocene i šest (6) pritužbi je podneto za sredstvo i devet (9) komentara koji nisu bili pritužbe za žicu vodiča na osnovu procene komentara dobijenih u kvalitetnim kliničkim anketama. Pritužbe su procenjene i za FemoSeal i za žicu vodiča i ocenjene su kao deo procesa nadzora kompanije Terumo nakon plasiranja na tržište. Nisu identifikovani novi rizici ili nivoi rizika.

Anketa za korisnike lekare završena je 2024. u okviru aktivnosti PMCF-a. Rezultati ankete su pokazali da su ocena performansi i bezbednost FemoSeal™ VCS u celosti bili veoma povoljni. Takođe je demonstrirana kompatibilnost žica vodiča koje se ne isporučuju standardno sa FemoSeal™ VCS.

#### **1.4.3.2 Tekuće/planirano kliničko praćenje nakon plasiranja na tržište**

TMC ima jednu tekuću/planiranu aktivnost kliničkog praćenja nakon plasiranja na tržište. Sprovede se klinička anketa radi prospektivnog sakupljanja povratnih informacija o upotrebi žica vodiča sa sredstvom FemoSeal VCS koje se distribuiraju na tržištu EU. Anketu će sprovedi lekari da bi se proučilo koje žice vodiče su koristili u toku procedure. Svrha ove ankete je da se ispravi nedostatak koji je identifikovan kao nedostatak literature i komentara spoljnih recenzenata o kompatibilnosti sistema FemoSeal™ VCS sa upotrebom drugih žica vodiča brendova koji nisu Terumo. Povratne informacije obuhvataju tehničke ishode, kliničke performanse i bezbednost u vezi sa performansama sredstva sa različitim žicama vodičima.

#### **1.4.4 Sažetak podataka iz sistematskog pregleda literature**

Kompanija Terumo Medical Corporation sprovodi sistematske analize literature da bi sakupila i procenila kliničke podatke o bezbednosti i performansama iz objavljenih studija za sredstvo FemoSeal™ VCS i/ili slična sredstva. Cilj godišnjeg pregleda objavljene literature je identifikovanje ranije nepoznatih neželjenih dejstava, praćenje poznatih pratećih dejstava, identifikovanje pojave rizika i identifikovanje moguće sistematske pogrešne upotrebe ili upotrebe sredstva FemoSeal™ VCS suprotno oznakama.

Najnoviji pregled sistematske literature, koji je obuhvatio period od 1. septembra 2019. do 31. avgusta 2024, identifikovao je 29 objavljenih studija koje su pružile kliničke podatke o bezbednosti i performansama sredstva FemoSeal™ VCS. U devet studija prijavljeno je dvadeset tri reference o upotrebi FemoSeal™ VCS u skladu sa specifikacijom, a upotreba mimo specifikacija je prijavljena u devet studija. U načelu, pregled literature studija koje se odnose na primenu sredstva FemoSeal™ VCS pokazuju populaciju iz studije koja je reprezentativna za pacijente u EU koji se podvrgavaju procedurama perkutane vaskularne kateterizacije. Pogledajte **odjeljak 3** za listu ove 23 publikacije za upotrebu u skladu sa specifikacijom sa stručnom recenzijom.

Kliničke performanse su ocenjene na osnovu sledećih mera:

- Vreme do hemostaze je bolje od ili uporedivo sa najboljim metodama za perkutano zatvaranje zajedničke femoralne arterije.
- Vreme do ambulacije je bolje od ili uporedivo sa najboljim metodama perkutanog zatvaranja zajedničke femoralne arterije.
- Stopa javljanja postoperativnih komplikacija je uporedivo sa ili manje od aktuelnih standarda nege.

Na osnovu ovih mera kliničkih performansi, podaci u ovom pregledu literature su pokazali da sredstvo FemoSeal™ VCS može uspešno da se koristi za zatvaranje punkcije femoralne arterije (arteriotomija) kod pacijenata koji su podvrgnuti perkutanoj kateterizaciji sa košuljicom za izvođenje procedure od 7 Fr ili manjom. Potpuna hemostaza je postignuta kod većine pacijenata (79,65%–100%) i povezana je sa srednjim vremenom do hemostaze od 0,5 minuta, srednjim vremenom do otpuštanja 3 dana. Između 69,2%–86,7% pacijenata bilo je u stanju da se kreće 5 sati nakon zatvaranja, sa srednjim vremenom postoperativnog odmora od 349 minuta. Neuspeh FemoSeal™ VCS je primećen u 3,68%–4% slučajeva, a dodatna ručna kompresija je bila potrebna u 0,9%–4,4% procedura.

Klinička bezbednost je procenjena na osnovu neželjenih događaja uključujući, ali ne isključivo:

- Krvarenje
- Hematom
- Pseudoaneurizma
- Modrica
- Arteriovenska fistula
- Infekcija
- Smrt

Za svaki od ovih neželjenih događaja, prijavljena stopa javljanja za FemoSeal™ VCS u obuhvaćenim studijama je bila manja ili uporediva sa istorijski prijavljenim stopama za ručnu kompresiju i druga sredstva za zatvaranje krvnih sudova.

Nisu identifikovani neželjeni događaji kroz pregled 10 sažetaka o slučaju, jer nisu identifikovani novi, neočekivani, nastajući ili neprihvatljivi rizici.

Ukupna efikasnost korišćenja FemoSeal™ VCS tokom dijagnostičke angiografije ili interventnih operacija zavisi od više faktora kao što su: pol, starost, anatomija pacijenta, komorbiditeti, anatomsko pozicioniranje mesta punkcije, iskustvo hirurga, metod postavljanja VCD-a, postoperativna nega itd. Pored tehničkog uspeha, uključujući postizanje hemostaze, FemoSeal™ VCS je pružao kliničke koristi u vezi sa zatvaranjem vaskularnog sistema nakon punkcije

femoralne arterije, kao što je skraćanje vremena do hemostaze, skraćanje vremena do pokretljivosti. Rezultati performansi sredstvo FemoSeal™ VCS su u skladu sa onima koji se očekuju za ovu vrstu sredstava kada se koriste u skladu sa namenom. Neke reference preuzete tokom aktuelnog perioda pretrage pokazuju upotrebu predmetnog sredstva na anatomskoj lokaciji koja nije zajednička femoralna arterija i za zatvaranje arteriotomija > 7 Fr, što se smatra upotrebom koja nije u skladu sa namenom.

Tokom pregleda nisu identifikovana nepoznata neželjena dejstva, nastali rizici ili moguća sistematska pogrešna upotreba sredstva. Međutim, ako FemoSeal™ VCS pažljivo koriste obučeni lekari, medicinsko sredstvo funkcioniše kao korisno i neophodno kliničko sredstvo. Ciljana terapija, a stoga i FemoSeal™ VCS, u načelu ispunjava kliničke potrebe koje trenutno postoje u lečenju komplikacija povezanih sa vaskularnim pristupom.

Ukupno gledano, podaci u ovom pregledu literature nisu identifikovali probleme sa performansama i bezbednošću u kliničkom okruženju koji su ranije bilo nepoznati ili neželjena dejstva koja su je desila u većem broju od očekivanog/prihvatljivog. Zato se iz ovog pregleda literature može zaključiti da se sredstvo FemoSeal™ VCS, kada se koristi za pružanje kompresije za hemostazu kod arteriotomije nakon perkutane kateterizacije, i dalje se ponaša kao što je očekivano i ne povezuje se sa ozbiljnim bezbednosnim događajima.

#### 1.4.5 Sažetak podataka iz praćenja nakon plasiranja na tržište

Uspostavljen je proaktivni PMS sistem i završena je analiza svih pritužbi na mesečnom nivou i u skladu sa internim postupcima proizvodnje. Podaci o pritužbama su analizirani u periodu od 1. septembra 2019. do 31. avgusta 2024. godine. Ukupno gledano, bilo je 28 izveštaja o vigilanci medicinskih sredstava (MDV) i proizvođaču je podneto 476 pritužbi. Od 28 MDV izveštaja, 27 je bilo vezano za neželjene događaje, a jedan za kvar sredstva. Došlo je do dva smrtna ishoda tokom perioda izveštavanja, ali ni za jedan od prijavljenih smrtnih ishoda nije dokazano da ima veze sa predmetnim sredstvom. Od 476 pritužbi podnetih proizvođaču, najčešći razlozi za pritužbe bili su poteškoće u postavljanju (146 pojava, 0,0142% učestalosti). Režim otkazivanja događaja povlačenja je drugi najčešći sa učestalošću od 0,0126% (130 događaja).

FemoSeal™ Vascular Closure System je prodat u preko 1.030.136 komada širom sveta i 827.843 u Evropskom ekonomskom prostoru. Izračunata učestalost pritužbi na osnovu prodaje na globalnom nivou je 0,046%. Ukupna stopa pritužbi kupaca je veoma niska. Nisu identifikovani novi rizici koji nisu obuhvaćeni Uputstvom za upotrebu i dokumentacijom o rizicima.

Stope javljanja neželjenih pratećih dejstava su prikazane u **tabeli 1.2**. Kroz pritužbe nisu uočeni neočekivani, nastajuć ili neprihvatljivi rizici. Nije došlo do značajnog povećanja učestalosti ili ozbiljnosti poznatih neželjenih dejstava.

#### 1.4.6 Ukupan rezime kliničke performanse i bezbednosti

Sredstvo FemoSeal™ VCS je indikovano za zatvaranje punkcije zajedničke femoralne arterije (arteriotomije) kod pacijenata koji su podvrgnuti perkutanoj kateterizaciji sa košuljicom za izvođenje procedure od najviše 7 F (2,33 mm). Ova klinička procena zasniva se na sveobuhvatnoj analizi dostupnih kliničkih podataka pre i posle plasiranja na tržište i literature relevantne za namenu sredstva FemoSeal™ VCS.

Sveobuhvatna analiza objavljene literature sprovedena je u periodu od 1. septembra 2019. do 31. avgusta 2024. Dokazi su obuhvatili 29 studija za FemoSeal™ VCS. Dokazi pruženi u kliničkoj proceni zaključuju da je predmetno sredstvo bezbedno i efikasno kada se koristi u skladu sa indikacijama, a svi rizici ili neželjena prateća dejstva koji mogu da budu povezani sa sredstvom u normalnim uslovima upotrebe predstavljaju prihvatljive rizike kada se uporede u odnosu na koristi za pacijenta. Rezultati performansi za predmetna sredstva su u skladu sa onima koji se očekuju za ovu vrstu sredstava kada se koriste u skladu sa namenom.

Potencijalni neželjena prateća dejstva koja se povezuju sa upotrebom sredstva FemoSeal™ VCS obuhvataju neželjene događaje koji se obično prijavljuju kod alternativnih načina zatvaranja arteriotomije, npr. krvarenje i hematom. U načelu, stope javljanja neželjenih događaja koji su prijavljeni kod upotrebe sredstva FemoSeal™ VCS su slične stopama prijavljenim za ručnu kompresiju i slična sredstva za zatvaranje mesta vaskularnog pristupa. Precizno, za krvarenje i hematom, prijavljene stope za sredstvo FemoSeal™ VCS su manje od prijavljenih stopa za slična sredstva za zatvaranje mesta vaskularnog pristupa. Svaki od prijavljenih neželjenih događaja, iz objavljene literature i nadzora nakon plasiranja na tržište, identifikovan je ranije (pogledajte **odjeljak 1.3**).

Postojeći podaci u vezi sa kliničkom bezbednošću i performansama ukazuju na to da koristi za pacijente od upotrebe ovog sredstva za zatvaranje vaskularnog pristupa nadmašuju moguće rizike kada se koristi u skladu sa Uputstvom za upotrebu.

Kao što je navedeno u prethodnim odeljcima, pruženi podaci za sredstvo FemoSeal™ VCS pokazuje doslednost između podataka u vezi sa sredstvom koje se evaluira (npr. korišćenje sredstva, bezbednosni ishodi, kliničke performanse i kliničke koristi), identifikovanim ekvivalentnim sredstvima i podacima u vezi sa sličnim sredstvima navedenim u najnovijim dostignućima.

Unakrsna analiza bezbednosnih podataka nije identifikovala nepodudaranja između sledećeg:

- Podaci navedeni u najnovijim dostignućima
- Podaci specifični za sredstvo koje se evaluira
- Podaci navedeni u datoteci/datotekama Upravljanje rizicima

- Podaci navedeni na oznaci i/ili u Uputstvu za upotrebu (tj. obrađeni su rezidualni rizici koje treba preneti korisniku).

Kliničku bezbednost su pokazale niske stope komplikacija identifikovane u objavljenoj kliničkoj literaturi sa stručnom recenzijom, kliničkim studijama koje je sponzorirala kompanija, analizi podataka nakon plasiranja na tržište u kombinaciji bez povlačenja sa tržišta. Nisu identifikovani problemu u performansama, analizirana literatura je sadržala upotrebu ispitivanog sredstva FemoSeal™ VCS koja je dosledna sa namenom koju je definisao proizvođač.

### 1.5 Moguće dijagnostičke terapijske alternative

Ručna kompresija se standardno koristi za postizanje hemostaze na mestu arteriotomije nakon vaskularnih kateterizacija. Ručna kompresija se dovodi u vezu sa imobilizacijom pacijenta u dužem vremenskom periodu (do 8 sati nakon procedure) i znatnim osećajem nelagode i produženim boravkom u bolnici. Nedavni sistematski pregled je otkrio da je srednje vreme do postizanja hemostaze kod ručne kompresije iznosilo 20,8 minuta.<sup>1</sup>

Alternative ručnoj kompresiji obuhvataju spoljna hemostatska sredstva koja primenjuju mehaničku kompresiju na mesto arteriotomije. Ova sredstva ne skraćuju vreme do postizanja hemostaze ili vreme do ambulacije, ali smanjuju zahteve u pogledu angažovanja osoblja jer ručnu kompresiju menjaju mehaničkom kompresijom. Stope javljanja neželjenih događaja povezanih sa upotrebom mehaničke kompresije su slične stopama za ručnu kompresiju.

Sredstva za zatvaranje krvnih sudova, kao što je FemoSeal™ VCS, dizajnirana su za zatvaranje arteriotomije. Cilj je da se skрати vreme do hemostaze i omogući ranija ambulacija. Nedavni sistematski pregled, koji je obuhvatio 13 komercijalno dostupnih sredstava, otkrio je da je srednje vreme do postizanja hemostaze sredstava za zatvaranje krvnih sudova iznosilo 5,4 minuta. Srednje vreme do postizanja hemostaze za pojedinačna sredstva za zatvaranje krvnih sudova je bilo u rasponu od 1 minuta (FemoSeal™ VCS) do 14 minuta; kod većine sredstava iznosilo je između 4 i 10 minuta.<sup>1</sup>

Najčešće prijavljeni neželjeni događaji povezani sa zatvaranjem mesta arteriotomije, sa ručnim kompresijama, spoljašnjim hemostatskim sredstvima ili sredstvima za zatvaranje krvnih sudova, obuhvataju hematoma, krvarenje na mestu pristupa, pseudoaneurizmu, arteriovensku fistulu i infekciju. Isti sistematski pregled (34 randomizovana kontrolisana ispitivanja, 14.401 pacijent) otkrilo je da su stope javljanja neželjenih događaja bile slične kod ručne kompresije i upotrebe sredstava za zatvaranje krvnih sudova, a jedina razlika je bila to što je krvarenje bilo malo obilnije kod sredstava za zatvaranje krvnih sudova.<sup>1</sup>

## 1.6 Predloženi profil korisnika i obuka

Predviđeni korisnici sredstva FemoSeal™ Vascular Closure System su lekari sa obukom koja ih kvalifikuje za izvođenje arterijskog pristupa i zatvaranja kod endovaskularnih procedura preko zajedničke femoralne arterije i koji učestvuju u programu za obuku lekara za FemoSeal™ kompanije Terumo Medical Corporation.

## 1.7 Relevantni harmonizovani i opšti standardi

Denna sammanfattning av säkerhet och klinisk prestanda ska ge allmänheten tillgång till en uppdaterad sammanfattning av de viktigaste aspekterna av säkerhet och kliniska prestanda för FemoSeal™ Vascular Closure System (VCS).

En sammanfattning av enhetens säkerhet och kliniska prestanda, avsedd för användare/sjukvårdspersonal ges nedan i **avsnitt 1.0**.

## **1.0 SAMMANFATTNING FÖR ANVÄNDARE/SJUKVÅRDSPERSONAL**

Sammanfattningen är inte avsedd att ersätta den bruksanvisning som utgör huvuddokumentet för att säkerställa säker användning av enheten, och är inte heller avsedd att ge förslag gällande diagnostik eller behandling till avsedda användare eller patienter. SSCP är inte avsedd att ersätta den obligatoriska informationen på implantatkorten eller i andra obligatoriska dokument.

### **1.1 Avsedd användning av enheten**

#### **1.1.1 Avsedd användning**

FemoSeal™ Vascular Closure System är en medicinteknisk produkt för förslutning av en arteriell punktion efter perkutan kateterisering genom den gemensamma femoralartären.

#### **1.1.2 Indikationer för användning**

FemoSeal™ Vascular Closure System är indicerat för användning vid förslutning av den vanliga femorala arteriella punktionen (arteriotomi) hos patienter som har genomgått perkutan kateterisering med hjälp av en ingreppshylsa på 2,33 mm (7F) eller mindre.

#### **1.1.3 Kontraindikationer och/eller begränsningar**

FemoSeal™ Vascular Closure System är kontraindicerat för patienter med arteriotomier där hylsor eller enheter som är större än 2,33 mm (7F) har använts.

#### **1.1.4 Avsedda patientpopulationer**

Säkerheten och effektiviteten hos FemoSeal™ Vascular Closure System har fastställts hos patienter från 18 års ålder som har genomgått perkutan kateterisering med en ingreppshylsa som är 2,33 mm (7F) eller mindre.

#### **1.1.5 Särskilda patientpopulationer**

Säkerhet och effektivitet för FemoSeal™ Vascular Closure System har inte fastställts för följande patientpopulationer:

- Patienter med befintlig autoimmun sjukdom.
- Patienter som genomgår terapeutisk trombolys.
- Patienter med kliniskt signifikant perifer kärlsjukdom.
- Patienter med okontrollerad hypertoni (> 220 mmHg systoliskt eller > 110 mmHg diastoliskt).
- Patienter med blödningsrubbning, inklusive trombocytopeni (trombocytvärde <100 000), eller anemi (Hgb <10 mg/dl).

- Patienter med en innerlumen i den femorala artären som är mindre än 5 mm.
- Patienter med nedsatt njur- och/eller leverfunktion.
- Patienter med annan relevant komorbiditet.
- Population med specifikt ras och/eller etniskt ursprung.
- Patienter med hjärtinfarkt inom 72 timmar.
- Patienter med kärltransplantat eller stent vid punktionsstället.
- Patienter som är gravida eller ammar.
- Patienter under 18 år.

### 1.1.6 Avsedda användare

De avsedda användarna av FemoSeal™ Vascular Closure System är läkare med utbildning som kvalificerar dem att utföra arteriell åtkomst och förslutning för endovaskulära ingrepp genom den gemensamma femoralartären och har deltagit i ett läkarinstruktionsprogram från Terumo Medical Corporation FemoSeal™.

## 1.2 Enhetsbeskrivning

### 1.2.1 Beskrivning av enheten

FemoSeal™ Vascular Closure System, tillverkat av Terumo Medical Corporation (TMC), är en resorberbar kärlförslutningsenhet utformad för att uppnå femoral arteriell hemostas efter perkutan kateterisering genom den gemensamma femoralartären.

FemoSeal™ förslutningselement består av två resorberbara polymerskivor, en inre tätning och en yttre låsskiva, som hålls samman av resorberbar multifilamenttråd och därigenom mekaniskt försluter arteriotomin (se **Figur 1.1** och **Figure 1.2**). När den yttre låsskivan har fällts ut genom den konformade hylsan pressas den fast på multifilamentaxeln vilket gör att punktionsstället mellan den inre och den yttre låsskivan stängs mekaniskt. Den inre tätningen och den yttre låsskivan hålls på plats genom friktion på multifilamentaxeln. Hemostas uppnås mekaniskt. Förslutningselementen bryts ned genom hydrolys.

De implanterbara förslutningskomponenterna, dvs. den inre tätningen och den yttre låsskivan, bryts ned på arton (18) månader medan multifilamentet uppskattas brytas ned och absorberas via hydrolys av omgivande vävnad efter två (2) till tre (3) år. Förmågan hos de implanterbara förslutningskomponenterna att upprätthålla kompression på arteriotomin har testats i upp till åtta (8) timmar. Nedbrytningsprodukterna metaboliseras och utsöndras i urinen eller går ut som koldioxid via lungorna. Inga ackumulerings effekter har observerats i djurstudier. De ytterligare

komponenter i FemoSeal™ som kommer att komma i kontakt med levande vävnad eller blod under ingreppet är den konformade hylsan, dilatatorn, packningsröret, införaren och ledaren.

**Figur 1.1 Inre tätning respektive yttre låsskiva**

**Figur 1.2 Inre tätning och yttre låsskiva utplacerad**

FemoSeal™-enheten är förpackad tillsammans med en dilatator och en ledare med en YD på 0,97 mm (0,038 tum), en längd på 70 cm (27,5 tum) och en J-uträtare, se **figur 1.3** nedan. Ledaren är innesluten i ett polyetylenrör. Alla delar är förpackade i en styv pappersförpackning. Förpackningen innehåller även patientimplantatkortet. FemoSeal™ Vascular Closure System kräver inga ytterligare tillbehör för att enheten ska fungera som avsett, och enheten är endast avsedd att användas med dilatatorn och ledaren som ingår i produktens förpackning.

\* Implanterbar del av enheten; implanterbara komponenter är MR-säkra

FemoSeal™ VCS är steriliserad med etylenoxid (EO) och är en medicinteknisk produkt för engångsbruk. FemoSeal™ VCS-enheten är konstruerad på ett sådant sätt att den inte kan återanvändas.

### **Driftläge**

FemoSeal™ VCS främjar mekanisk hemostas genom implantering av förslutningselement inuti och utanför den gemensamma femorala artären. Den inre förseglingen som förseglar punktionsstället och den yttre låsbrickan som håller den inre förseglingen på plats förhindrar blödning.

### **1.2.3 Klinisk nytta**

FemoSeal™ VCS ger följande kliniska fördelar jämfört med kärlförslutning efter punktion av den gemensamma femorala artären:

- Kortare tid till hemostas<sup>1</sup>

- Kortare tid till mobilitet<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Tidigare generation(er) eller varianter

- Den första versionen av FemoSeal™ VCS (#11200) såldes på den europeiska marknaden under 2005 och 2006.
- Den aktuella FemoSeal™ VCS (#11202) med förbättrat leveranssystem har funnits på marknaden sedan 28 mars 2006.

#### 1.2.5 Tillbehör avsedda att användas i kombination med enheten

FemoSeal™-enheten är förpackad tillsammans med en dilatator, en 0,97 mm (0,038") OD, en 70 cm (27,5") lång ledare och en J-uträtare. Ledaren är ett tillbehör till FemoSeal™-enheten. J-uträtaren är en komponent i ledaren, medan dilatatorn är en komponent i FemoSeal™-enheten. Ledaren är den enda komponent som anses vara ett tillbehör. Ledaren är innesluten i ett polyetylenrör. Alla delar är förpackade i en styv pappersförpackning. Förpackningen innehåller även patientimplantatkortet. FemoSeal™ Vascular Closure System kräver inga ytterligare tillbehör för att enheten ska fungera som avsett, och enheten är endast avsedd att användas med dilatatorn och ledaren som ingår i produktens förpackning.

#### 1.2.6 Andra enheter och produkter som är avsedda att användas i kombination med enheten

FemoSeal™ VCS kräver inga ytterligare enheter för att fungera som avsett.

### 1.3 Risker och varningar

#### 1.3.1 Kvarstående risker och oönskade effekter

Kända eller förutsebara biverkningar, skador och komplikationer i samband med användning av FemoSeal™ VCS till följd av kvarstående risk listas i **tabell 1.2**. Frekvensen baseras på en analys av riskdokumentationen och beräknas utifrån data från övervakning efter marknadsintroduktion från 1 januari 2019 till 31 augusti 2024. Det finns inga okända restrisker för FemoSeal™ VCS och alla tillämpliga risker har hanterats genom bruksanvisningen och riskhanteringsprocessen.

**Tabell 1.2. Biverkningar/komplikationer med FemoSeal**

| Skada                                      | Förekomst (%) | Risikförebyggande faktorer                                                                                                                                                   |

### 1.3.2 Varningar och försiktighetsåtgärder

#### Varningar

1. Använd inte produkten om förpackningen är skadad eller om den sterila barriären inte är intakt.
2. Använd inte efter utgångsdatum – de biologiskt nedbrytbara komponenterna kanske inte fungerar som de ska.
3. Använd inte produkten om någon del verkar skadad eller defekt på något sätt.
4. Användning av FemoSeal™ Vascular Closure System där bakteriell kontaminering av ingreppshylsan eller omgivande vävnad kan ha inträffat kan orsaka infektion.
5. Om det misstänks att den bakre arteriella väggen har punkterats eller mer än en arteriell punktion har gjorts ska du inte förlita dig enbart på FemoSeal™ Vascular Closure System för att uppnå arteriell hemostas. Använd ytterligare manuell eller mekanisk kompression.
6. Om punktionsstället är vid eller placerat distalt om den femorala artärens bifurkation ska FemoSeal™ Vascular Closure System inte användas på grund av risken för felaktig placering av den inre förseglingen. Detta kan leda till blödningskomplikationer och/eller störningar i det normala blodflödet.
7. Vid ihållande arteriell blödning från incisionsstället ska multifilamentet inte klippas till förrän hemostas har uppnåtts. Om hemostas inte uppnås, fäst multifilamentet med ett sterilt sårförband och applicera kompletterande kompression tills hemostas uppnås. Vid ihållande arteriell blödning kan betydande blödningskomplikationer uppstå, vilket kan leda till patientskada eller dödsfall.
8. Använd inte FemoSeal™ Vascular Closure System om punktionsstället är proximalt om ljumskligamentet eftersom detta kan leda till retroperitonealt hematom.
9. Patienter med högre blödningsrisk kan drabbas av ökad blodförlust som kräver transfusion.
10. Om den inre skivan lossnar kan det potentiellt orsaka en trombotisk och/eller embolisk händelse.

#### Försiktighetsåtgärder

1. FemoSeal™ Vascular Closure System ska användas av läkare med adekvat utbildning i användning av enheten.
2. Utför ett begränsat femoralt angiogram eller en ultraljudsvägledd femoralpunktion innan FemoSeal™ Vascular Closure System placeras ut.
3. Avbryt proceduren om:

- Lumendiameter för femoral artär < 5 mm.
  - Stenos och/eller betydande plack förekommer i närheten av det gemensamma femorala arteriella punktionsstället.
  - Arteriell punktion är vid, eller distalt om, den femorala artärens bifurkation.
  - Avvikande förgreningar eller kärlabnormiteter förekommer i närheten av det gemensamma femorala arteriella punktionsstället.
4. Om hematom föreligger måste extra försiktighet iakttas för korrekt införande av den konformade hylsan i artären.
  5. Använd en enkelväggig punktionsmetod. Punktera inte artärens posteriora vägg.
  6. Använd alltid steril teknik vid användning av FemoSeal™ Vascular Closure System.
  7. FemoSeal™ Vascular Closure System är endast avsett för engångsbruk och ska inte omsteriliseras eller återanvändas på något sätt. FemoSeal™-enheten är utformad på ett sådant sätt att den inte kan återanvändas.
  8. Avbryt proceduren om den inre förseglingen löser ut på grund av oväntat motstånd.
  9. För korrekt placering av den inre förseglingen ska du flytta tummen så att knappen kan fjädra tillbaka fritt.
  10. Se till att spetsen på FemoSeal™-enhetens konformade hylsa är under hudytan innan den yttre låsskivan placeras ut. Den yttre låsskivan kan oavsiktligt placeras ovanför hudnivån hos patienter med ett kort avstånd mellan den femorala artären och hudnivån.
  11. För korrekt placering kan ett hudsnitt vara nödvändigt före placering.
  12. Om den inre förseglingen är inne i artären men det inte är möjligt att trycka in knappen helt och placera ut den yttre låsskivan så kan det krävas ett kirurgiskt ingrepp för att ta bort FemoSeal™ förslutningselement.
  13. Om ompunktion av samma femorala artär blir nödvändig inom 18 månader ska ompunktion göras minst en centimeter proximalt om det tidigare åtkomststället för FemoSeal™ Vascular Closure System.
  14. Instruera patienten att följa läkarens ordination om inspektion av förslutningsstället.
  15. Instruera patienten att bära patientinformationskortet under de kommande 18 månaderna

### **Försiktighetsåtgärder vid utskrivning**

Innan utskrivning övervägs ska patienten bedömas med avseende på följande kliniska tillstånd:

1. Blödning och/eller hematom vid förslutningsstället.
2. Smärta när patienten går.

3. Tecken på infektion vid förslutningsstället.

### 1.3.3 Korrigerande säkerhetsåtgärder för marknaden

Det fanns en korrigerande säkerhetsåtgärd för marknaden som omfattade FemoSeal™ VCS under perioden 1 september 2019 till 31 augusti 2024.

2022 återkallade Terumo frivilligt FemoSeal™ VCS på grund av klagomål som påstods bero på fel i process- och partifrisläppningstester av Elkton-tillverkade FemoSeal-produkter för mätning av tryckkraft och retraktionskraft. Totalt återkallades 950 enheter från Sydkorea.

## 1.4 Klinisk utvärdering och klinisk uppföljning efter marknadsintroduktion

**Tabell 1.3** innehåller en lista över de centrala studier som bidrog till att föra ut FemoSeal™ VCS på marknaden samt studier efter marknadsintroduktion och kliniska uppföljningsaktiviteter efter marknadsintroduktion. Enhetsversionen som används i studien ingår i tabellen nedan. Den första versionen av FemoSeal™ VCS (#11200) fanns på marknaden fram till 2006, medan nästa version (#C11202) släpptes på marknaden 2006 och är den produkt som för närvarande finns på marknaden.

**Tabell 1.3 Sammanfattning av centrala studier**

| Funktionell djurtestning före marknadsintroduktion                                                                                                                                                                                                                      | Enhetsversion             |

| Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | Radi Medical System AB<br><br>Utförs av Biomatech, Frankrike |  | biologiskt nedbrytbart implantat som utformats för att uppnå hemostas i kärlsystemet. Det testade instrumentet var avsett att föras in i punktionshål i artärer för att uppnå hemostas. En skiva fördes in i punktionshålet i artären och den andra drog åt den inre skivan från utsidan av artären. Båda skivorna fördes in genom en införrarhylsa. Skivorna utformades för att förhindra blödning, för att läka in i kärlväggen och slutligen brytas ned och absorberas. Studien utformades för att samla in och analysera data efter funktionell implantation hos får och gris för att utvärdera implantatets förmåga att upprätthålla den fysiologiska funktionen när det används i cirkulationssystemet, för att fastställa värdens respons och enhetens respons (fysisk integritet, vävnadsinkapsling vid avlivning) och för att utvärdera implantatets nedbrytning | 4 får, 1 gris<br><br>14 förslutningselement<br><br>8 förslutningselement implanterade i 2 får,<br><br>2 förslutningselement implanterade i 1 gris<br><br>När två förslutningselement implanterades i samma femorala artär implanterades de på ett avstånd > 30 mm | lesion) eller bildande av tunn pseudointimal vävnad registrerades. Särskild uppmärksamhet ägnades åt initial vävnadsintegration av enheten, med särskilt fokus på inkapslingen av den interna skivan.<br><br>Makroskopiskt observerades inga signifikanta tecken på lokal intolerans eller trombos. Den makroskopiska observationen visade ingen skillnad mellan fåret eller grisen efter implantation av förslutningselementen i de femorala artärerna. Makroskopiskt observerades inga signifikanta tecken på lokal intolerans eller trombos. Den makroskopiska observationen visade ingen skillnad mellan fåret eller grisen efter implantation av förslutningselementen i de femorala artärerna.<br><br>Den histopatologiska analysen av implantationsstället hos får visade inga lokala biverkningar. De inre och yttre skivorna uppvisade tecken på nedbrytning och hade i vissa fall brutits ned till mindre delar. De inre skivorna integrerades helt i neointimal vävnad. Hos grisen visade den histopatologiska analysen något fler inflammatoriska tecken runt de inre och yttre skivorna. På båda djuren uppvisade multifilamentet några fler |

Som en del av utvecklingsplanen före marknadsintroduktion för FemoSeal™ VCS genomfördes tre djurtester. Innan kliniska studier inleddes år 2000 genomfördes en djurstudie för att utvärdera den biologiska funktionaliteten hos FemoSeal™ VCS. I denna studie utvärderades förslutningselementens förmåga att upprätthålla den fysiologiska funktionen och förslutningselementens nedbrytning. Vid 18 månader var det inre och yttre skivmaterialet inte längre synligt efter att ha ersatts med en endoluminal fibrös vävnad. Sammanfattningsvis bekräftades kapaciteten hos FemoSeal™ VCS förslutningselement för att upprätthålla fysiologisk funktion när det används i det cirkulatoriska systemet.

2002 genomfördes en djurstudie för att utvärdera biokompatibiliteten och biofunktionaliteten hos ett biologiskt nedbrytbart implantat, FemoSeal™ VCS, utformat för att uppnå hemostas i kärlsystemet. Sammanfattningsvis var nedbrytningen av implantatet nästan fullständig efter 36 veckor och det förekom ingen signifikant ogynnsam vävnadsreaktion.

En annan djurstudie år 2002 utvärderade biokompatibiliteten och biofunktionaliteten hos ett biologiskt nedbrytbart implantat, FemoSeal™ VCS, utformat för att uppnå hemostas i kärlsystemet. Efter 5 veckor var inkapslingen av skivan komplett och tecken på nedbrytning observerades för inre och yttre skivor. Sammanfattningsvis bekräftades implantatets förmåga att upprätthålla fysiologisk funktion när det användes i det cirkulatoriska systemet.

Som en del av den kliniska utvecklingsplanen för FemoSeal™ VCS genomförde Radi Medical System AB en klinisk prövning före marknadsintroduktion. Denna kliniska prövning är inte publicerad eller tillgänglig online. Studien med enhetsmodell #11200 utfördes 2002-2004 enligt den europeiska standarden EN 540 (Clinical Investigation of Medical Devices for Human Subjects) och i enlighet med ICH General Considerations for Clinical Trials and Guideline for Good Clinical Practice. Detaljerna i denna studie dokumenteras i rapporten EU-SE-001. Den kliniska prövningen har dokumenterats i slutrapporten från Radi Medical Systems AB – ”Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures”. Den kliniska studien utfördes med FemoSeals™ första modell #11200 och fokuserade på säkerheten och effektiviteten hos de implanterbara förslutningskomponenterna. Den enda skillnaden mellan den första modellen #11200 och den nuvarande modellen, C11202, är storleken, 6F respektive 7F, och det förbättrade leveranssystemet. De kliniska fördelarna, den avsedda användningen, användningsprinciperna och råmaterialen i de implanterbara förslutningselementen, den inre förseglingen och den yttre låsskivan kvarstår oförändrade.

Enhetens avsedda användning var för patienter som genomgick diagnostiska hjärt- eller interventionella hjärtingrepp med den femorala artären som åtkomstpunkt. Syftet med denna studie var att fastställa säkerhet, prestanda och effektivitet hos FemoSeal™ VCS. Detta var en prospektiv, enarmad och öppen multicenterstudie med 30 dagars uppföljning.

Den primära funktionsslutpunkten var tid till hemostas, definierat som frånvaro av rikliga blödningar. Den primära säkerhetsslutpunkten var incidensen av allvarliga kärlkomplikationer under 30 dagar. Sekundära slutpunkter var tid till mobilisering, andelen behandlingsmisslyckanden, incidens av biverkningar och produktens prestandaegenskaper under leverans och driftsättning.

Patienterna i denna studie var vuxna som kunde ge informerat samtycke och med minst en pedalpuls. Patienter uteslöts från studien om de hade något av följande tillstånd:

- Anamnes på perifer kärlsjukdom

- Autoimmuna sjukdomar
- Känd blödningssjukdom vid svår anemi
- INR >1.5
- Hjärtinfarkt inom 72 timmar
- Okontrollerad hypertoni trots behandling
- Fetma som förhindrar åtkomst med Seldinger-teknik
- Förekomst av kärltransplantat eller stent vid arteriotomistället
- Tidigare ipsilateral punktion inom 3 månader
- Förväntad livslängd < 6 månader

Dessutom undersöktes patienterna intraoperativt och exkluderades från studien om något av följande observerades:

- Lumendiameter för femoral artär <5 mm
- Artärgrenar inom 2 cm från punktionsstället
- Signifikant stenosis inom 3 cm från punktionsstället
- Användning av den primära införlshylsan >6Fr
- Punktion vid eller distalt om den femoral artärens bifurkation
- Flera femoralpunktioner
- Känd eller misstänkt punktion av den bakre femoralväggen
- Stort hematoma (2:6 cm) när ingreppet är slutfört
- Svårt att föra in den primära hylsan vid ingrepp på grund av slingrig vävnad eller slingriga kärl

Denna studie med ett protokoll genomfördes i två delar: 20 patienter rekryterades till del 1 varefter en säkerhetsanalys genomfördes och sedan rekryterades ytterligare 60 patienter till del 2.

I del 1 var genomsnittsåldern för de rekryterade patienterna 65,9 år, 70,0 % av patienterna var män och 95 % av patienterna stod på samtidig medicinering. I del 2 av studien var genomsnittsåldern 63,8 år, 78 % var män och 100 % stod på samtidig medicinering.

Patienter som genomgick diagnostiska (del 1 och del 2) eller interventionella (del 2) hjärkateteriseringsprocedurer kunde rekryteras till studien. Procedurerna överensstämde med vårdstandarden på vart och ett av de inskrivna sjukhusen, följt av användning av FemoSeal™ VCS. Patientdata samlades in vid startpunkten, under proceduren och 1 dag och 30 dagar efter

proceduren. Resultaten sammanfattas i **tabell 1.5** och indikerar att FemoSeal™ VCS är säker och effektiv att använda i denna patientpopulation.

**Tabell 1.5 Kliniska resultat rapporterade i förmarknadsstudien**

|                                                                                                                | Del 1        | Del 2                     |
|----------------------------------------------------------------------------------------------------------------|--------------|---------------------------|
| Antal patienter                                                                                                | 20           | 60                        |
| Genomsnittlig tid till hemostas                                                                                | 1,2 minuter  | 1,6 minuter <sup>a</sup>  |
| Genomsnittlig tid till ambulation                                                                              | 72,2 minuter | 87,5 minuter <sup>b</sup> |
| Incidens av större vaskulära komplikationer <sup>c</sup>                                                       | 0 (0 %)      | 1 (2 %)                   |
| Antal patienter med biverkningar                                                                               | 5 (25 %)     | 19 (32 %)                 |
| Behandlingssvikt (definieras som större vaskulära komplikationer, behov av manuell kompression eller bådadera) | 0 (0 %)      | 3 (5 %)                   |
| Funktionsfel                                                                                                   | 0 (0 %)      | 6 (10 %)                  |

<sup>a</sup> Baserat på en total provstorlek på 58 eftersom 2 patienter inte uppnådde hemostas vid tidpunkten för ingreppet på grund av tidigare ipsilaterala punktioner. Hemostas uppnåddes efter 7 minuter och 37 minuter för dessa patienter.

<sup>b</sup> Baserat på en total provstorlek på 59: 1 patient inkluderades inte eftersom patienten var placerad på ventilator på grund av lungödem och inte kunde röra sig på över en vecka.

<sup>c</sup> Definition av vaskulär komplikation som kräver blodtransfusion eller kirurgisk reparation, eller lokal infektion som kräver administrering av antibiotika, sjukhusinläggning eller förlängning av sjukhusvistelsen, eller debridering av platsen

Inga större vaskulära komplikationer observerades i del 1 av studien. En (1) större vaskulär komplikation rapporterades i del 2 av studien: pseudoaneurysm som rapporterades inom en dag efter ingreppet. Händelsen krävde ultraljudsvägledd kompression och en injektion av trombin i pseudoaneurysmet och förlängde patientens sjukhusvistelse.

Av de fem biverkningar som rapporterades i del 1 av studien fanns det en (1) möjlig enhetsrelaterad biverkning: en icke-allvarlig händelse med rikliga blödningar 1 dag efter ingreppet. Av de 19 biverkningar som rapporterades i del 2 av studien observerades tre produktrelaterade icke-allvarliga biverkningar av hematom, och sex eventuellt enhetsrelaterade

icke-allvarliga händelser observerades, inklusive tre rapporter om kvarstående utsöndring av sårvätska, två om hematom och en (1) om bensmärta efter träning.

Behandlingen anses som misslyckad för tre patienter i del 2: Två på grund av att hemostas inte uppnåddes utan användning av kompression och en (1) på grund av den allvarliga vaskulära komplikationen (pseudoaneurysm). Inga behandlingsmisslyckanden inträffade i del 1 av studien.

Av de sex enhetsfunktionsfelen i del 2 av studien var det tre som inte störde proceduren, ett tillskrevs handhavandefel, ett var läckage i införaren och en var en trasig filamentled. De resterande två felen åtgärdades i med modelluppdateringar som implementerades i C11202.

Del 2 av den kliniska studien före marknadsintroduktionen rapporterade inte uppföljningsresultaten efter 6 månader på grund av att patienter inte följde ordinationen. 30-dagarsresultaten från den kliniska studien före marknadsintroduktionen (EU-SE-001), som är i linje med den kliniska litteraturens uppföljningsperiod, visar att FemoSeal™ VCS är säker och effektiv.

#### 1.4.2 Sammanfattning av data från kliniska studier efter marknadsintroduktion

Det fanns fyra slutförda kliniska studier efter marknadsintroduktion som beskrivs i **tabell 1.6** nedan. Dessa kliniska undersökningar publiceras inte och är inte tillgängliga online.

**Tabell 1.6 Kliniska studier efter marknadsintroduktion**

| Slutförda kliniska studier efter marknadsintroduktion                                       |                             |                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                    |                                                                                                                                    |

Studien 2006 genomfördes för att bekräfta säkerheten och effektiviteten hos den nuvarande enheten med ett förbättrat leveranssystem och för att få återkoppling på bruksanvisningen och utbildningsprogrammet för FemoSeal™ VCS. Studien omfattade 100 patienter och den primära slutpunkten var att undersöka om hemostas uppnåddes eller om ytterligare manuella eller mekaniska kompressioner behövdes. I denna studie drogs slutsatsen att användningen av FemoSeal™ VCS var framgångsrik i majoriteten av fallen (91 % uppnådde omedelbar hemostas).

I 2008 års studie deltog 50 patienter för att bedöma säkerhet och prestanda hos FemoSeal™ VCS vid användning under normala kliniska rutiner hos patienter som genomgick hjärkateterisering med en 7F-hylsa. Studiens primära slutpunkt var att samla in data om tiden till hemostas och tiden till mobilisering utan ytterligare kompression, manuell eller mekanisk. I studieresultaten drogs slutsatsen att den genomsnittliga tiden till hemostas var 57,8 sekunder och att alla patienter kunde vara uppe och röra på sig efter 4 timmars sängliggande.

Studien från 2009 utfördes i syfte att utvärdera den nya FemoSeal™ VCS-förpackningen. 25 patienter rekryterades till studien. Den primära slutpunkten var om användaren upplevde några problem med förpackningen. Användarna noterade inga problem med den nya FemoSeal™ VCS-förpackningen. Denna studie samlade också in data om tiden till hemostas.

Syftet med studien från 2022 var att proaktivt samla in data om säkerheten och effektiviteten hos FemoSeal VCS när det gäller att uppnå hemostas vid åtkomstställen i den femorala artären (CFA) hos verkliga patienter som genomgår perkutana endovaskulära ingrepp. 230 patienter

rekryterades till studien. De primära slutpunkterna för studien är lyckat förfarande (dvs. lyckad hemostas vid punktionsstället) och minskning av allvarliga komplikationer (t.ex. kärlskada, blödning vid åtkomststället, infektion vid åtkomststället, upprepad manuell kompression och ny ipsilateral akut benischemi vid åtkomststället). Studien kom fram till att FemoSeal™ VCS fungerar bra i verkliga miljöer och ger effektiv hemostas och låga frekvenser av komplikationer vid åtkomststället för patienter som genomgår perifera endovaskulära ingrepp. Den uppvisar god prestanda med kort tid till hemostas och god användarvänlighet, vilket gör FemoSeal™ VCS till en värdefull enhet för förslutning av femoral åtkomst.

### 1.4.3 Sammanfattning av data från kliniska studier efter marknadsintroduktion

#### 1.4.3.1 Slutförda uppföljande kliniska undersökningar efter marknadsintroduktion

En sammanfattning av de slutförda kliniska uppföljningsaktiviteterna efter marknadsintroduktionen beskrivs i **tabell 1.7** nedan.

**Tabell 1.7. Kliniska uppföljningsaktiviteter efter marknadsintroduktion**

| Slutförda kliniska uppföljningsaktiviteter efter marknadsintroduktion     |          |                                                                              |                                                                                                                                                                                       |                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Terumo Medical Corporation har genomfört tre högkvalitativa användarundersökningar för läkare under den aktuella rapporteringsperioden (1 september 2019-31 augusti 2024).

FemoSeal™ Clinical Surveys samlade in proaktiva kliniska data i relation till säkerheten och prestandan hos FemoSeal™ VCS under klinisk användning. Undersökningen omfattade frågor som fokuserade på den övergripande enheten och associerade tillbehör, inklusive 0,038”-ledaren och direkta interaktioner mellan enheten och tillbehören. De kliniska undersökningarna om ledare samlade in proaktiva kliniska data avseende säkerhet och prestanda vid klinisk användning av 0,038”-ledaren som levererades med FemoSeal™ VCS. Frågorna i undersökningen fokuserade specifikt på den allmänna användningen av ledaren, från införande genom ingreppshylsan in i vaskulaturen till avlägsnande av ledaren.

FemoSeal™ VCS och 0,038”-ledaren som medföljer enheten klassificerades som godkänd av alla undersökningsdeltagare, sex (6) klagomål om enheten lämnades in, och nio (9) icke-klagomål om ledaren lämnades in baserat på en utvärdering av de kommentarer som erhöles från de högkvalitativa kliniska undersökningarna. Klagomålen har utvärderats för både FemoSeal och ledaren och bedömdes som en del av Terumos övervakningsprocess efter godkännandet för försäljning. Inga nya risker och/eller risknivåer identifierades.

En användarundersökning för läkare genomfördes 2024 som en del av aktiviteterna för klinisk uppföljning efter marknadsintroduktion (PMCF). Resultaten av undersökningen visade att betygen för prestanda och säkerhet för FemoSeal™ VCS överlag var mycket gynnsamma. Kompatibiliteten hos andra ledare än den standardversion som medföljer FemoSeal™ VCS visades också.

**1.4.3.2 Pågående/planerad klinisk uppföljning efter marknadsintroduktion**

TMC har en pågående/planerade kliniska uppföljningsaktiviteter efter marknadsintroduktion. En klinisk undersökning kommer att genomföras för att prospektivt samla in feedback om användningen av ledaren med FemoSeal VCS som distribueras på EU-marknaden. Undersökningen kommer att fyllas i av läkare för att studera vilka ledare de använde under

proceduren. Syftet med denna undersökning är att åtgärda en lucka som identifierats som bristen på litteratur och kommentarer från externa granskare om kompatibiliteten för FemoSeal™ VCS med andra ledare från andra varumärken än Terumo. Återkopplingen omfattar tekniska resultat, klinisk prestanda och säkerhet som rör enhetens prestanda med olika ledare.

#### 1.4.4 Sammanfattning av data från systematisk litteraturgranskning

Terumo Medical Corporation genomför systematiska litteraturgranskningar för att samla in och utvärdera kliniska säkerhets- och prestandadata från publicerade studier av FemoSeal™ VCS och/eller liknande produkter. Syftet med den årliga granskningen av den publicerade litteraturen är att identifiera tidigare okända biverkningar, övervaka kända biverkningar, identifiera framväxande risker och identifiera möjlig systematisk felaktig användning eller off-labelanvändning av FemoSeal™ VCS.

Den senaste systematiska litteraturgranskningen, som omfattade perioden 1 september 2019 till 31 augusti 2024, identifierade 29 publicerade studier som gav kliniska säkerhets- och prestandadata för FemoSeal™ VCS. Tjugotre referenser rapporterade användning av FemoSeal™ VCS på etiketten och off label-användning rapporterades i nio studier. Sammantaget visar litteraturgranskningen av specifika studier för användning av FemoSeal™ VCS en studiepopulation som är representativ för patienter i EU som genomgår perkutan kärllkateterisering. Se **avsnitt 3** för en lista över dessa 23 fackgranskade publikationer.

Klinisk prestanda bedömdes med följande mått:

- Tiden till hemostas är bättre än eller jämförbar med den senaste tekniken för perkutan förslutning av femoralartärpunktion.
- Tiden till mobilisering är bättre än eller jämförbar med den senaste tekniken för perkutan förslutning av den gemensamma femoralartären.
- Frekvensen av postoperativa komplikationer är jämförbar eller lägre än nuvarande standardvård.

Baserat på dessa kliniska prestandamått visade data i denna litteraturgenomgång att FemoSeal™ VCS kan användas med framgång för att försluta den femorala arteriella punktionen (arteriotomi) hos patienter som har genomgått perkutan kateterisering med en 7 Fr-hylsa eller mindre ingreppshylsa. Fullständig hemostas uppnåddes hos majoriteten av patienterna (79,65-100 %) och var förknippad med en mediantid till hemostas på 0,5 min och medeltid till utskrivning på 3 dagar. Mellan 69,2 och 86,7 % av patienterna kunde röra sig 5 timmar efter förslutning, med en genomsnittlig postoperativ bästa tid på 349 minuter. Fel på FemoSeal™ VCS observerades i 3,68-4 % av fallen och ytterligare manuell kompression krävdes i 0,9-4,4 % av ingreppen.

Klinisk säkerhet bedömdes med hjälp av biverkningar, inklusive men inte begränsat till:

- Blödning
- Hematom
- Pseudoaneurysm
- Blåmärken
- Arteriovenös fistel
- Infektion
- Dödsfall

För var och en av dessa biverkningar var frekvensen som rapporterades för FemoSeal™ VCS i de inkluderade studierna lägre än eller jämförbar med historiskt rapporterade frekvenser för manuell kompression och andra kärlförslutningsenheter.

Inga biverkningar identifierades genom granskning av 10 fallrapporter, eftersom inga nya, oförutsedda, framväxande eller oacceptabla risker identifierades.

Den övergripande effektiviteten vid användning av FemoSeal™ VCS under diagnostisk angiografi eller interventionella operationer beror på flera faktorer som: kön, ålder, patientens anatomi, komorbiditeter, anatomisk placering av punktionsstället, kirurgens erfarenhet, metod för placering av VCD, postoperativ vård, osv. Förutom teknisk framgång, inklusive uppnådd hemostas, erbjöd FemoSeal™ VCS klinisk nytta jämfört med kärlförslutning efter punktering av femoralartären, såsom kortare tid till hemostas och kortare tid till mobilisering.

Prestandaresultaten för FemoSeal™ VCS överensstämmer med de som förväntas för denna typ av enhet när den används såsom avsett. Några av de referenser som hämtades under den aktuella sökperioden visade användning av den undersökta enheten på en annan anatomisk plats än den gemensamma femoralartären och för förslutning av arteriotomier > 7 Fr, vilket anses vara off-label.

Inga okända biverkningar, framväxande risker eller möjlig systematisk felaktig användning av enheten identifierades under granskningen. Men om FemoSeal™ VCS används med försiktighet av utbildade läkare fungerar den medicintekniska produkten som en användbar och nödvändig klinisk produkt. Sammantaget tillgodoser målbehandlingen och därmed FemoSeal™ VCS det kliniska behov som för närvarande finns vid behandling av komplikationer relaterade till vaskulär åtkomst.

Sammantaget visade data från denna litteraturgranskning inte på några prestanda- eller säkerhetsproblem i den kliniska miljön som tidigare inte var kända, eller negativa effekter som uppträdde med högre än förväntad/acceptabel frekvens. Av denna litteraturöversikt kan man därför dra slutsatsen att FemoSeal™ VCS fortsätter att fungera som förväntat när den används för att ge kompression för hemostas vid arteriotomin efter perkutan kateterisering och inte är förknippad med allvarliga säkerhetsrisker.

#### 1.4.5 Sammanfattning av data från övervakning efter marknadsintroduktion

Ett proaktivt PMS-system finns på plats och en genomgång av alla klagomål görs månatligen och i enlighet med interna tillverkningsrutiner. Reklamationsdata analyserades under tidsperioden 1 september 2019 till 31 augusti 2024. Totalt inkom 28 MDV-rapporter (Medical Device Vigilance) och 476 kundklagomålsrapporter till tillverkaren. Av de 28 MDV-rapporterna var 27 relaterade till biverkningar och en till funktionsfel på enheten. Det förekom två dödsfall under rapporteringsperioden, men inget av de rapporterade dödsfallen bedömdes vara relaterat till studieprodukten. Av de 476 klagomål som lämnades in till tillverkaren var de vanligaste orsakerna till klagomålen svårigheter vid införandet (146 förekomster, 0,0142 % förekomstfrekvens). Felläge för utdragningshändelser är det näst vanligaste med en frekvens på 0,0126 % (130 händelser).

Fler än 1 030 136 FemoSeal Vascular Closure System™-enheter har sålts globalt och 827 843 inom Europeiska ekonomiska samarbetsområdet. Den beräknade reklamationsfrekvensen baserat på global försäljning är 0,046 %. Den totala kundklagomålsfrekvensen är mycket låg. Inga nya risker identifierades som inte ingår i bruksanvisningen och riskdokumentationen.

Förekomsten av oönskade biverkningar visas i **tabell 1.2**. Inga nya oförutsedda, framväxande eller oacceptabla risker identifierades genom klagomålen. Det fanns inga signifikanta öknings av frekvensen eller svårighetsgraden av kända biverkningar.

#### 1.4.6 Övergripande sammanfattning av klinisk prestanda och säkerhet

FemoSeal™ VCS är indicerad för användning vid förslutning av den vanliga femorala arteriella punktionen (arteriotomi) hos patienter som har genomgått perkutan kateterisering med en ingreppshylsa på 2,33 mm (7F) eller mindre. Denna kliniska utvärdering är baserad på en omfattande analys av tillgängliga kliniska data och litteratur före och efter marknadsintroduktion som är relevanta för den avsedda användningen av FemoSeal™ VCS.

En omfattande granskning av publicerad litteratur utfördes under perioden 1 september 2019 till och med 31 augusti 2024. Evidensen inkluderade 29 studier för FemoSeal™ VCS. Evidensen som tillhandahålls i den kliniska utvärderingen drar slutsatsen att produkten är säker och effektiv när den används enligt anvisningarna och att eventuella risker och oönskade biverkningar som kan förknippas med produkten under normala användningsförhållanden utgör acceptabla risker när de vägs mot fördelarna för patienten. Prestandaresultaten för de berörda enheterna

överensstämmer med de som förväntas för denna typ av enhet när den används enligt avsedd användning.

Möjliga biverkningar i samband med användning av FemoSeal™ VCS inkluderar de biverkningar som ofta rapporteras med alternativa metoder för arteriotomiförslutning, t.ex. blödning och hematom. Totalt sett är frekvensen av biverkningar som rapporterats vid användning av FemoSeal™ VCS likartad den frekvens som rapporterats med manuell kompression och liknande kärlförslutningsenheter. Specifikt för blödning och hematom är de rapporterade frekvenserna för FemoSeal™ VCS lägre än de rapporterade frekvenserna för liknande vaskulära förslutningsenheter. Alla rapporterade biverkningar, både från den publicerade litteraturen och från övervakningen efter marknadsintroduktionen, hade identifierats tidigare (se **avsnitt 1.3**).

Befintliga data avseende klinisk säkerhet och prestanda för FemoSeal™ VCS tyder på att patientfördelarna med att använda denna vaskulära förslutningsenhet överväger eventuella risker när den används i enlighet med bruksanvisningen.

Enligt vad som anges ovan visar de data som tillhandahålls för FemoSeal™ VCS överensstämmelsen mellan de data som är relaterade till den utvärderade enheten (t.ex. användningen av enheten, säkerhetsresultat, klinisk prestanda och kliniska fördelar) och identifierar likvärdiga produkter och data relaterade till liknande nyligen utvecklade enheter.

Den jämförande analysen av säkerhetsdata identifierade inga luckor mellan:

- Data som nämns i de senaste rönen
- Data som är specifika för den enhet som utvärderas
- Data som nämns i riskhanteringsdokumentationen
- Data som nämns i märkningen och/eller bruksanvisningen (dvs. återstående risker som ska förmedlas till användaren).

Klinisk säkerhet har visats genom låga frekvenser av komplikationer som identifierats i den publicerade kollegialt granskade kliniska litteraturen, företagssponsrade kliniska studier, granskning av data efter marknadsintroduktionen i kombination med det faktum att produkten inte dragits tillbaka från marknaden. Inga prestandaproblem har upptäckts. Den litteratur som granskades behandlade användning av FemoSeal™ VCS enligt tillverkarens avsedda användning.

### **1.5 Möjliga diagnostiska eller terapeutiska alternativ**

Manuell kompression används traditionellt för att uppnå hemostas vid arteriotomistället efter kärlkateteriseringar. Manuell kompression har förknippats med att patienten varit immobiliserad under långa perioder (upp till 8 timmar efter ett ingrepp) och med betydande obehag och förlängd sjukhusvistelse. En nyligen genomförd systematisk granskning visade att mediantiden för att uppnå hemostas med manuell kompression var 20,8 minuter.<sup>1</sup>

Alternativ till manuell kompression inkluderar externa hemostatiska enheter som applicerar mekanisk kompression på arteriotomistället. Dessa enheter förkortar inte tiden till hemostas eller mobilisering, men minskar personalens behov genom att ersätta manuell kompression med mekanisk kompression. Biverkningsfrekvenser i samband med användning av mekanisk kompression liknar frekvenserna vid manuell kompression.

Vaskulära förslutningsenheter, såsom FemoSeal™ VCS, är utformade för att stänga arteriotomier. De syftar till att minska tiden till hemostas och möjliggöra tidigare mobilisering. I en nyligen genomförd systematisk granskning som omfattade 13 kommersiellt tillgängliga enheter fann man att mediantiden för att uppnå hemostas med en kärlförslutningsenhet var 5,4 minuter.

Mediantiden för hemostas för de enskilda kärlförslutningsenheterna varierade från 1 minut (FemoSeal™ VCS) till 14 minuter, där majoriteten av enheterna krävde mellan 4 och 10 minuter.<sup>1</sup>

Vanliga rapporterade biverkningar i samband med förslutning av arteriotomistället, med manuella kompressioner, externa hemostatiska enheter eller kärlförslutningsenheter, inkluderar hematom, blödning vid åtkomststället, pseudoaneurysm, arteriovenös fistel och infektion. Samma systematiska granskning (34 randomiserade kontrollerade prövningar, 14 401 patienter) fann att biverkningsfrekvenserna var likartade för manuell kompression och användning av kärlförslutningsenheter, med undantag för att blödningen tenderade att öka något med kärlförslutningsanordningar.<sup>1</sup>

## 1.6 Föreslagen användarprofil och utbildning

De avsedda användarna av FemoSeal™ Vascular Closure System är läkare med utbildning som kvalificerar dem att utföra arteriell åtkomst och förslutning för endovaskulära ingrepp genom den gemensamma femoralartären och har deltagit i ett läkarinstruktionsprogram från Terumo Medical Corporation FemoSeal™.

Bu Güvenlik ve Klinik Performans Özeti (SSCP), FemoSeal™ Vascular Closure System (VCS) cihazının güvenlik ve klinik performansının ana yönlerinin güncellenmiş bir özetine genel erişim sağlamayı amaçlamaktadır.

Cihazın kullanıcılarına/sağlık uzmanlarına yönelik güvenlik ve klinik performans özeti aşağıdaki **Bölüm 1.0'**da verilmiştir.

## 1.0 KULLANICILAR / SAĞLIK UZMANLARI İÇİN ÖZET

SSCP, cihazın güvenli kullanımını sağlamaya dair asıl belge olan Kullanım Talimatlarının yerine kullanılamaz ve kullanıcılara veya hastalara tanısal veya terapötik öneriler sunmayı amaçlamamaktadır. SSCP, implant kartlarındaki veya diğer zorunlu belgelerdeki zorunlu bilgilerin yerini almak üzere tasarlanmamıştır.

### 1.1 Cihazın Kullanım Amacı

#### 1.1.1 Kullanım Amacı

FemoSeal™ Vascular Closure System, ortak femoral arter yoluyla perkütan kateterizasyondan sonra arter ponksiyonunun kapatılması için tasarlanmış tıbbi bir cihazdır.

#### 1.1.2 Kullanım Talimatları

FemoSeal™ Vascular Closure System, 7F (2,33 mm) veya daha küçük bir prosedür kılıfı kullanılarak perkütan kateterizasyon yapılan hastalarda ortak femoral arter ponksiyonunun (arteriyotomi) kapatılmasında kullanılmak üzere endikedir.

#### 1.1.3 Kontrendikasyonlar ve/veya Sınırlamalar

FemoSeal™ Vascular Closure System, 7F (2,33 mm)'den daha büyük kılıf veya cihazların kullanıldığı arteriyotomileri olan hastalarda kontrendikedir.

#### 1.1.4 Hedef Hasta Popülasyonu

FemoSeal™ Vascular Closure System cihazının güvenilirliği ve etkinliği, 18 yaş ve üzeri, 7F (2,33 mm) veya daha küçük bir prosedür kılıfı kullanılarak perkütan kateterizasyon uygulanan hastalarda belirlenmiştir.

#### 1.1.5 Özel Hasta Popülasyonları

FemoSeal™ Vascular Closure System cihazının güvenliği ve etkinliği aşağıdaki hasta popülasyonlarında belirlenmemiştir:

- Önceden otoimmün hastalığı olan hastalar.
- Terapötik tromboliz uygulanan hastalar.
- Klinik olarak anlamlı periferik vasküler hastalığı olan hastalar.
- Kontrolsüz hipertansiyona sahip hastalar (> 220 mmHg sistolik veya > 110 mmHg diyastolik).
- Trombositopeni (< 100.000 trombosit sayımı) veya anemi (Hgb < 10 mg/dl) dahil olmak üzere kanama bozukluğu olan hastalar.

- Ortak femoral arterin iç lümeni 5 mm'den küçük olan hastalar.
- Böbrek ve/veya hepatik bozukluğu olan hastalar.
- Diğer ilgili komorbiditeli hastalar.
- Spesifik ırk ve/veya etnik kökenli nüfus.
- 72 saat içinde miyokard enfarktüsü olan hastalar.
- Ponsiyon alanında vasküler greft veya stent bulunan hastalar.
- Hamile veya emziren hastalar.
- 18 yaşından küçük hastalar.

### 1.1.6 Amaçlanan Kullanıcılar

FemoSeal™ Vascular Closure System cihazının amaçlanan kullanıcıları, ortak femoral arter yoluyla endovasküler prosedürler için arteriyel erişim ve kapama gerçekleştirme konusunda eğitim almış ve Terumo Medical Corporation FemoSeal™ doktor eğitim programına katılmış doktorlardır.

## 1.2 Cihaz Açıklaması

### 1.2.1 Cihazın Açıklaması

Terumo Medical Corporation (TMC) tarafından üretilen FemoSeal™ Vascular Closure System, ortak femoral arter yoluyla perkütan kateterizasyondan sonra femoral arteriyel hemostaz sağlamak için tasarlanmış, yeniden emilebilir bir vasküler kapama cihazıdır.

FemoSeal™ kapatma elemanları, emilebilen multifilaman ile bir arada tutulan iç kapak ve dış kilitleme diski olmak üzere iki emilebilir polimer diskten oluşur ve bu sayede arteriyotominin mekanik olarak kapatılmasını sağlar (bk. **Şekil 1.1** ve **Şekil 1.2**). Koni muhafaza kılıfı yoluyla yerleştirildikten sonra, dış kilitleme diski multifilaman şaft üzerine sıkıştırılır ve iç ve dış kilitleme diski arasındaki delinme bölgesinin mekanik olarak kapatılmasını sağlar. İç kapak ve dış kilitleme diski, multifilaman şaft üzerindeki sürtünme yoluyla yerinde tutulur. Hemostaz mekanik yollarla elde edilir. Kapatma elemanları hidroliz ile bozunur.

İmplant edilebilir kapatma bileşenleri, iç kapak ve dış kilitleme diski, on sekiz (18) ay içinde bozunurken multifilamanın iki (2) ila üç (3) yıl sonra çevre doku tarafından hidrolizle bozulacağı ve absorbe edileceği tahmin edilir. İmplant edilebilir kapatma bileşenlerinin arteriyotomi üzerindeki kompresyonu koruma becerisi sekiz (8) saate kadar test edilmiştir. Degradasyon ürünleri metabolize edilir ve idrarda atılır veya akciğerler aracılığıyla karbondioksit olarak ekspirasyon yapılır. Hayvanlar üzerinde yapılan araştırmalarda birikim etkisi gözlenmemiştir.

İşlem sırasında canlı doku veya kanla temas edecek FemoSeal™'in ek bileşenleri; koni muhafaza kılıfı, dilatör, sıkıştırma tüpü, itici ve kılavuz teldir.

**Şekil 1.1 Sırasıyla İç Kapak ve Dış Kilitleme Diski**

**Şekil 1.2 Yerleştirilmiş İç Kapak ve Dış Kilitleme Diski**

FemoSeal™ ünitesi bir dilatör ve 0,038 inç (0,97 mm) DÇ, 27,5 inç (70 cm) uzunlukta bir kılavuz tel ve bir J düzleştirici ile birlikte paketlenmiştir, aşağıdaki **Şekil 1.3**'e bakın. Kılavuz tel, polietilen bir tüp içinde bulunur. Tüm parçalar sabit bir kağıt tepside paketlenmiştir. Paket ayrıca hasta implant kartını da içerir. FemoSeal™ Vascular Closure System, cihazın amaçlandığı gibi çalışması için ek aksesuarlar gerektirmez ve cihaz sadece ürünün ambalajında bulunan dilatör ve kılavuz tel ile kullanılmak üzere tasarlanmıştır.

### Şekil 1.3 FemoSeal™ VCS Ünitesi ile Kılavuz Tel ve Dilatör

#### 1.2.2 Ham Maddeler ve Bileşenler

Aşağıdaki Tablo 1.1'de FemoSeal™ VCS'nin bileşenleri listelenmiştir.

**Tablo 1.1 FemoSeal™ VCS Ham Maddeleri ve Bileşenleri**

| Parça Numarası | Açıklama                                                          | Materyaller                                                                                                                                                                                                                                                                                        |

\* Cihazın implante edilebilir kısmı; implante edilebilir bileşenler MRG için tehlike oluşturmazlar

FemoSeal™ VCS Etilen Oksit (EO) ile sterilize edilmiştir ve tek kullanımlık bir tıbbi cihazdır. FemoSeal™ VCS cihazı tekrar kullanılamayacak şekilde tasarlanmıştır.

### **Eylem Modu**

FemoSeal™ VCS, sık kullanılan femoral arterin içine ve dışına implante edilebilir kapatma elemanları uygulayarak mekanik hemostazı destekler. Kanamayı önleyen mekanizma, delme alanını kapatan iç kapak ve iç kapağı yerinde tutan dış kilitleme diski ile sağlanır.

### **1.2.3 Klinik Fayda**

FemoSeal™ VCS ortak femoral arter ponksiyonundan sonra vasküler kapamayla ilgili olarak aşağıdaki klinik faydaları sağlar:

- Hemostaz süresini kısaltma<sup>1</sup>
- Ambülasyon süresini kısaltma<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

#### 1.2.4 Önceki Nesil(ler) veya Varyantlar

- FemoSeal™ VCS'in ilk sürümü (#11200), 2005 yılında ve 2006 yılının bir kısmında Avrupa pazarında satılmıştır.
- Geliştirilmiş bir uygulama sistemine sahip mevcut FemoSeal™ VCS (#11202), 28 Mart 2006'dan beri piyasada.

#### 1.2.5 Cihazla Birlikte Kullanılması Amaçlanan Aksesuarlar

FemoSeal™ ünitesi bir dilatör, 0,038 inç (0,97 mm) DÇ, 27,5 inç (70 cm) uzunluğunda bir kılavuz tel ve bir J düzleştirici ile birlikte paketlenir. Kılavuz tel, FemoSeal™ ünitesinin bir aksesuarıdır. J-düzleştirici, kılavuz telin bir bileşenidir, dilatör ise FemoSeal™ ünitesinin bir bileşenidir. Kılavuz tel, dikkate alınan tek aksesuardır. Kılavuz tel, polietilen bir tüp içinde bulunur. Tüm parçalar sabit bir kağıt tepside paketlenmiştir. Paket ayrıca hasta implant kartını da içerir. FemoSeal™ Vascular Closure System, cihazın amaçlandığı gibi çalışması için ek aksesuarlar gerektirmez ve cihaz sadece ürünün ambalajında bulunan dilatör ve kılavuz tel ile kullanılmak üzere tasarlanmıştır.

#### 1.2.6 Cihazla Birlikte Kullanılması Amaçlanan Diğer Cihazlar ve Ürünler

FemoSeal™ VCS'nin amaçlanan şekilde çalışması için ek cihazlar gerekmez.

### 1.3 Riskler ve Uyarılar

#### 1.3.1 Rezidüel Riskler ve İstenmeyen Etkiler

FemoSeal™ VCS'nin kullanımıyla ilişkili olan ve rezidüel riskten kaynaklanan, bilinen veya öngörülebilir advers olaylar, zararlar ve komplikasyonlar **Tablo 1.2'**de listelenmiştir. Oluşma oranı, Risk Dokümantasyonu'nun analizine dayanır ve 1 Eylül 2019 - 31 Ağustos 2024 tarihleri arasındaki Pazarlama Sonrası Gözetim verilerine göre hesaplanır. FemoSeal™ VCS'ye ilişkin herhangi bir bilinmeyen rezidüel risk bulunmamaktadır ve tüm geçerli riskler Kullanım Talimatları ve risk yönetim süreci yoluyla ele alınmıştır.

**Tablo 1.2. FemoSeal Advers Olaylar/Komplikasyonlar**

| Zarar                                   | Oluşma Oranı (%) | Azaltıcı Faktörler                                                                                                                                                |
|-----------------------------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 1.3.2 Uyarılar ve Önlemler

#### Uyarılar

1. Paket hasar görmüşse veya steril bariyerlerden herhangi biri sağlam değilse kullanmayın.
2. Son kullanma tarihinden sonra kullanmayın. Biyolojik olarak bozunabilir bileşenler yeterli bir şekilde çalışmayabilir.
3. Herhangi bir ögenin hasarlı veya kusurlu görünmesi durumunda kullanmayın.
4. FemoSeal™ Vascular Closure System cihazının, prosedür kılıfında veya etrafındaki dokuda bakteriyel kontaminasyonun enfeksiyona neden olabileceği durumlarda kullanılması.
5. Posterior arteriyel duvarın delindiğinden veya birden fazla delinme olduğundan şüpheleniliyorsa, arteriyel hemostazın sağlanmasında yalnızca FemoSeal™ Vascular Closure System cihazına güvenmeyin. İlave manuel veya mekanik kompresyon kullanın.
6. Ponksiyon bölgesi femoral arter bifurkasyonundaysa veya buna distal konumdaysa, İç Kapağın yanlış yerleştirilmesi riski nedeniyle FemoSeal™ Vascular Closure System kullanılmamalıdır. Bu olay, kanama komplikasyonlarına ve/veya normal kan akışında bozulmaya neden olabilir.
7. İnsizyon bölgesinden sürekli arteriyel kanama varsa, hemostaz sağlanana kadar multifilamanı kesmeyin. Hemostaz sağlanamazsa, multifilamanı steril yara sargısıyla sabitleyin ve hemostaz sağlanana kadar ek kompresyon uygulayın. Devam eden arteriyel kanama durumunda, önemli kanama komplikasyonları meydana gelebilir ve bu da hastanın yaralanmasına veya ölümüne neden olabilir.
8. Delinme bölgesi inguinal ligamente proksimal ise FemoSeal™ Vascular Closure System cihazını kullanmayın, çünkü bu retroperitoneal hematoma neden olabilir.
9. Kanama riski daha yüksek olan hastalar artan kan kaybı yaşayabilir ve transfüzyon gerektirebilir.
10. İç diskin ayrılması trombotik ve/veya embolik bir olaya yol açabilir.

#### Önlemler

1. FemoSeal™ Vascular Closure System yerleştirme prosedürü, cihazın kullanımı konusunda yeterli eğitime sahip doktorlar tarafından gerçekleştirilmelidir.
2. FemoSeal™ Vascular Closure System cihazının yerleştirilmesinden önce sınırlı bir femoral anjiyogram veya ultrason kılavuzlu femoral ponksiyon gerçekleştirin.
3. Aşağıdaki durumlarda prosedürü durdurun:
  - Ortak femoral arterin lümen çapı 5 mm'den küçük ise.

- Ortak femoral arter ponksiyon bölgesi yakınında stenoz ve/veya önemli plak bulunması.
  - Arteriyel ponksiyon, femoral arter bifurkasyonunda veya distalindedir.
  - Ortak femoral arter ponksiyon bölgesinin yakınında anormal dallar veya damar anormallikleri var.
4. Herhangi bir hematoma varsa, koni muhafaza kılıfının artere doğru yerleştirilmesine özellikle dikkat edilmelidir.
  5. Tek duvar delme tekniđi kullanın. Arterin posterior duvarını delmeyin.
  6. FemoSeal™ Vascular Closure System cihazını kullanırken her zaman steril tekniklere uyun.
  7. FemoSeal™ Vascular Closure System yalnızca tek kullanımlıktır ve hiçbir şekilde yeniden sterilize edilmemeli veya yeniden kullanılmamalıdır. FemoSeal™ ünitesi, tekrar kullanılamayacak şekilde tasarlanmıştır.
  8. İç Kapağın takılması beklenmedik bir dirençle karşılaşırsa, prosedürü bırakın.
  9. İç Kapağın doğru şekilde takılması için başparmağınızı, düğme serbest şekilde geri yayanabilecek şekilde yeniden konumlandırın.
  10. Dış Kilitleme Diski'ni yerleştirmeden önce FemoSeal™ Ünitesi'nin koni muhafaza kılıfının ucunun cilt yüzeyinin altında olduğundan emin olun. Dış Kilitleme Diski, femoral arter ile cilt seviyesi arasında kısa bir mesafe olan hastalarda, yanlışlıkla cilt seviyesinin üzerinde yerleştirilebilir.
  11. Doğru yerleştirme için yerleştirmeden önce bir deri insizyonu gerekli olabilir.
  12. İç Kapak arterin içindeyse, ancak düğmeye tam olarak basmak ve Dış Kilitleme Diskini yerleştirmek mümkün değilse, FemoSeal™ Kapatma Ögelerini çıkarmak için ameliyat gerekebilir.
  13. 18 ay içinde aynı femoral arterin tekrar delinmesi gerekirse, yeni delik, önceki FemoSeal™ Vascular Closure System erişim bölgesine en az bir santimetre proksimal olacak şekilde açılmalıdır.
  14. Hastadan, kapatma sahasının incelenmesiyle ilgili olarak doktorun talimatlarına uymasını isteyin.
  15. Hastadan, gelecek 18 ay için Hasta Bilgi Kartını taşımasını isteyin

### **Taburculuk işlemi sırasında alınacak önlemler**

Taburculuk işlemi göz önünde bulundurmadan önce hastayı aşağıdaki klinik durumlar açısından değerlendirin:

1. Kapatma alanında kanama ve/veya hematoma.
2. Yürürken ağrı oluşması.
3. Kapatma alanında enfeksiyon belirtileri.

### **1.3.3 Saha Güvenliği Düzeltici Faaliyetleri**

1 Eylül 2019 ile 31 Ağustos 2024 arasında FemoSeal™ VCS'yi içeren bir Saha Güvenliği Düzeltici Faaliyeti vardı.

Terumo, 2022 yılında, Elkton tarafından üretilen FemoSeal ürününün Sıkıştırma Kuvveti Ölçümü ve Retraksiyon Kuvveti ile ilgili proses ve parti piyasaya sürme testini geçemediğini öne süren şikâyetler nedeniyle FemoSeal™ VCS'yi gönüllü olarak geri çağırdı. Güney Kore'den toplam 950 adet ünite geri çağırıldı.

### **1.4 Klinik Değerlendirme ve Pazarlama Sonrası Klinik Takip**

**Tablo 1.3'te** FemoSeal™ VCS'yi piyasaya sunmanın yanı sıra pazarlama sonrası çalışmalara ve pazarlama sonrası klinik takip faaliyetlerine götüren önemli çalışmaların bir listesi yer almaktadır. Çalışmada kullanılan cihazın sürümü aşağıdaki tabloda verilmiştir. FemoSeal™ VCS'in (#11200) ilk sürümü 2006 yılına kadar piyasadaydı, bir sonraki sürüm (#C11202) 2006 yılında piyasaya sürüldü ve günümüzde piyasada bulunan bir sürümdür.

**Tablo 1.3 Önemli Çalışmaların Özeti**

| <b>Pazarlama Öncesi Fonksiyonel Hayvan Testi</b>                                                                                                                                                                                                                        | <b>Cihaz Sürümü</b>      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vasculature System. Functional Implantation Test in Sheep 12-, 15-, and 18-month Time Periods. (R1051-1), 2000, Radi Medical System AB (performed by Biomatech, France). | 11200                    |
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep 12-, 24-, and 36-Week Time-Periods. (R1050-1), 2002, Radi Medical System AB (performed by Biomatech, France). | 11200                    |
| Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).         | 11200                    |
| <b>İnsanlarda İlk Klinik Çalışma</b>                                                                                                                                                                                                                                    |                          |
| Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures (EU-SE-001); 2004, Radi Medical Systems AB.                                                            | 11200                    |

| Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France). | Biomatech, Fransa tarafından gerçekleştirildi |  | biyoilevselliğini değerlendirmektir. Test edilen cihaz, hemostazın sağlanması için arterlerdeki ponksiyon deliğine girmeye yöneliktir. Bir disk arterdeki ponksiyon deliğine girmiştir, diğer disk arterin dışından dâhili diski sıkıştırmıştır. Her iki disk bir giriş seti kılıfının içinden geçirilmiştir. Diskler kanamayı önlemek, damar duvarının içini iyileştirmek ve son olarak bozularak absorbe olmak üzere tasarlanmıştır. Çalışma, koyun ve domuzda fonksiyonel implantasyondan sonra veri toplamak ve analiz etmek, implantın dolaşım sisteminde kullanıldığında fizyolojik fonksiyonu sürdürme kapasitesini değerlendirmek, konakçının yanıtını ve cihazın tepkisini belirlemek (fiziksel bütünlük, feda edilme sırasında dokusal kapsülleme) ve implantın degradasyonunu değerlendirmek için tasarlanmıştır | 14 kapatma elemanı<br><br>2 koyuna implante edilen 8 kapatma elemanı,<br><br>1 domuza implante edilen 2 kapatma elemanı<br><br>Aynı femoral artere iki kapatma elemanı implante edildiğinde, 30 mm'den daha fazla bir mesafede implante edildiler | Dahili disk kapsüllemesine özel bir önem gösterilerek cihazın ilk dokusal entegrasyonuna özel dikkat gösterilmiştir.<br><br>Makroskopik olarak lokal intolerans veya tromboz oluşumuna dair önemli belirtiler gözlenmemiştir. Makroskopik gözlemede, femoral arterlerde kapatma elemanlarının implantasyonundan sonra koyun veya domuz arasında herhangi bir fark görülmemiştir. Makroskopik olarak lokal intolerans veya tromboz oluşumuna dair önemli belirtiler gözlenmemiştir. Makroskopik gözlemede, femoral arterlerde kapatma elemanlarının implantasyonundan sonra koyun veya domuz arasında herhangi bir fark görülmemiştir.<br><br>Koyunlarda implantasyon yerinin histopatolojik analizinde lokal advers reaksiyon görülmemiştir. İç ve dış diskler degradasyon belirtileri göstermiştir ve bazı durumlarda daha küçük parçalara bölünmüştür. İç diskler tamamen neointimal dokuya entegre edilmiştir. Domuzda histopatolojik analiz, iç ve dış disklerin etrafında biraz daha fazla enflamatuvar işaret göstermiştir. Her iki hayvanda da multifilaman, disk materyaline göre biraz daha fazla enflamatuvar belirti göstermiştir; bu da |

FemoSeal™ VCS için pazarlama öncesi geliştirme planının bir parçası olarak 3 hayvan fonksiyonel testi tamamlanmıştır. 2000 yılında, klinik çalışmalara başlamadan önce FemoSeal™ VCS'nin biyoişlevselliğini değerlendirmek için bir hayvan çalışması yapılmıştır. Bu çalışma, fizyolojik fonksiyonu korumak ve degradasyonlarını değerlendirmek için kapatma unsurlarının kapasitesini değerlendirmiştir. 18. ayda, iç ve dış disk materyali endolüminal fibröz doku ile değiştirildiği için artık görünmüyordu. Sonuç olarak, dolaşım sisteminde kullanıldığında FemoSeal™ VCS kapatma elemanının fizyolojik işlevini sürdürebilmesi onaylanmıştır.

2002 yılında, vasküler sistemde hemostaz elde etmek için tasarlanmış biyolojik olarak parçalanabilen bir implant olan FemoSeal™ VCS'nin biyoyumluluğunu ve biyoişlevselliğini değerlendirmek için bir hayvan çalışması yapılmıştır. Özetle, implantın degradasyonu yaklaşık 36 hafta önce tamamlanmış ve önemli bir advers dokusal reaksiyon görülmemiştir.

2002 yılında yapılan bir başka hayvan çalışması, vasküler sistemde hemostaz elde etmek için tasarlanmış biyolojik olarak parçalanabilen bir implant olan FemoSeal™ VCS'nin biyouyumluluğunu ve biyoışlevselliğini değerlendirdi. 5 hafta sonra diskin kapsüllenmesi tamamlandı ve iç ve dış disklerde degradasyon izleri gözlemlendi. Sonuç olarak, dolaşım sisteminde kullanıldığında implantın fizyolojik fonksiyonunu sürdürme kapasitesi onaylanmıştır.

FemoSeal™ VCS için klinik geliştirme planının bir parçası olarak, Radi Medical System AB pazar öncesi bir klinik araştırma gerçekleştirmiştir. Bu klinik araştırma yayınlanmamıştır veya çevrimiçi olarak sunulmamaktadır. 11200 numaralı cihaz modeli ile yapılan çalışma, 2002-2004 yıllarında Avrupa Standardı EN 540 (İnsan Denekler için Tıbbi Cihazların Klinik Araştırması) kapsamında ve ICH Klinik Araştırmalar için Genel Hususlar ve İyi Klinik Uygulama Kılavuzu'na uygun olarak gerçekleştirilmiştir. Bu çalışmanın ayrıntıları EU-SE-001 raporunda belgelenmiştir. Bu klinik araştırma, Radi Medical Systems AB'nin "Multi-Centre Clinical Trial of the FemoSeal Vascular Closure System for Sealing Femoral Arterial Punctures After Diagnostic/Interventional Cardiology Procedures" isimli çalışmasının Nihai Raporunda belgelenmiştir. Söz konusu klinik çalışma, FemoSeal™'ın 11200 numaralı ilk modeliyle gerçekleştirilmiş ve implante edilebilir kapatma bileşenlerinin güvenliliğine ve etkililiğine odaklanmıştır. İlk model 11200 ile mevcut model C11202 arasındaki tek fark, sırasıyla 6F ve 7F French boyutu ve geliştirilmiş uygulama sistemidir. İmplant edilebilir kapatma elemanlarının, iç kapağın ve dış kilitleme diskinin klinik faydaları, kullanım amacı, çalışma ilkeleri ve ham maddeleri değişmeden kalır.

Cihazın kullanım amacı, femoral arteri erişim noktası olarak kullanarak tanısal kardiyak veya girişimsel kardiyak prosedürler uygulanan hastalar içindir. Bu çalışmanın amacı, FemoSeal™ VCS'nin güvenliğini, performansını ve etkililiğini belirlemektir. Bu çalışma, 30 günlük takip ile ileriye dönük, çok merkezli, tek kollu, açık etiketli bir çalışmaydı.

Birincil performans sonlanım noktası, akut kanamanın olmaması olarak tanımlanan hemostaz süresiydi. Birincil güvenlik sonlanım noktası, 30 gün içinde önemli vasküler komplikasyonların görülme sıklığıydı. İkincil sonlanım noktaları arasında ambülasyona kadar geçen süre, tedavi başarısızlıklarının oranı, advers olayların görülme sıklığı ve uygulama ve yerleştirme sırasında cihaz performans özellikleri yer aldı.

Bu çalışmaya dahil edilen hastalar, bilgilendirilmiş onam verebilen ve en az bir sağlam pedal pulsatifi olan yetişkinlerdi. Hastalar aşağıdaki durumlardan herhangi birine sahipse çalışma dışı bırakılmıştır:

- Periferik vasküler hastalık öyküsü
- Otoimmün hastalık
- Şiddetli anemide bilinen kanama bozukluğu
- INR >1,5

- 72 saat içinde miyokard enfarktüsü
- Tedaviye rağmen kontrolsüz hipertansiyon
- Seldinger tekniği ile erişimi engelleyen obezite
- Arteriyotomi bölgesinde vasküler greft veya stent varlığı
- 3 ay içinde önceki ipsilateral ponksiyon
- Kullanım ömrü < 6 ay

Ek olarak, hastalar intraoperatif olarak muayene edilmiştir ve aşağıdakilerden herhangi biri gözlemlenirse çalışmadan hariç tutulmuştur:

- Ortak femoral arterin lümen çapı <5 mm
- Ponksiyon bölgesine 2 cm proksimal arteriyel dallar
- Ponksiyon bölgesinin 3 cm içinde belirgin stenoz
- Birincil giriş seti kılıfının kullanımı >6Fr
- Femuoral bifürkasyonunda veya distalinde ponksiyon
- Çoklu femoral ponksiyonlar
- Bilinen veya şüphelenilen posterior femoral duvar ponksiyonu
- Prosedürün tamamlanmasından sonra büyük hematoma (2:6 cm)
- Kıvrık doku veya damar nedeniyle prosedür için zor birincil kılıf yerleştirilmesi

Bu tek protokol çalışması iki bölümde gerçekleştirilmiştir: Bölüm 1'de 20 hasta kaydedilmiş, ardından bir güvenlik analizi tamamlanmıştır ve ardından Bölüm 2'de 60 hasta daha kaydedilmiştir.

Bölüm 1'de, kayıtlı hastaların ortalama yaşı 65,9'du, hastaların %70,0'u erkekti ve %95'i eş zamanlı olarak ilaç kullanmaktaydı. Çalışmanın 2. bölümünde ortalama yaş 63,8'di, %78'i erkekti ve %100'ü eş zamanlı olarak ilaç kullanmaktaydı.

Tanısal (Bölüm 1 ve Bölüm 2) veya girişimsel (Bölüm 2) kardiyak kateterizasyon işlemleri yapılan hastalar çalışmaya kaydolmak için uygun görülmüştür. FemoSeal™ VCS kullanıldıktan sonra prosedürler, kaydolan hastanelerin her birinde bakım standardıyla uyumluydu. Hasta verileri başlangıçta, prosedür sırasında ve prosedürden 1 gün sonra ve 30 gün sonra toplanmıştır. Sonuçlar **Tablo 1.5'te** özetlenmiştir ve FemoSeal™ VCS'nin bu hasta popülasyonunda kullanım için güvenli ve etkili olduğunu göstermektedir.

**Tablo 1.5 Pazarlama Öncesi Çalışmada Rapor Edilen Klinik Sonuçlar**

<sup>a</sup> Toplam örneklem büyüklüğü 58 olarak hesaplanmıştır, çünkü 2 hasta önceki ipsilateral ponksiyonlar nedeniyle işlem sırasında hemostaza ulaşmamıştır. Bu hastalarda 7 dakikada ve 37 dakikada hemostaz sağlandı.

<sup>b</sup> Toplam 59 örneklem büyüklüğüne dayalı olarak: 1 hasta pulmoner ödem nedeniyle ventilatöre yerleştirildiği ve bir haftadan fazla ambülasyon yapamadığı için çalışmaya dahil edilmemiştir.

<sup>c</sup> Kan transfüzyonu veya cerrahi onarım gerektiren vasküler komplikasyon veya antibiyotik uygulanması, hastaneye yatış veya hastaneye yatış uzatma veya bölge debridmanı gerektiren lokal enfeksiyon olarak tanımlanır

Çalışmanın 1. bölümünde önemli vasküler komplikasyonlar gözlenmemiştir. Çalışmanın 2. Bölümünde bildirilen 1 majör vasküler komplikasyon bulunmaktadır: prosedürden 1 gün sonra bildirilen psödoanevrizma. Olay, ultrason eşliğinde kompresyon ve psödoanevrizmaya trombin enjeksiyonu gerektirmiştir ve hastanın hastanede yatış süresini uzatmıştır.

Çalışmanın 1. Bölümünde bildirilen 5 advers olay arasından 1 advers olay muhtemelen cihazla ilgiliydi: prosedürden 1 gün sonra ciddi olmayan bir akut kanama olayı. Çalışmanın 2. Bölümünde bildirilen 19 advers olay arasından cihazla ilişkili ciddi olmayan 3 advers hematoma olayı gözlemlendi ve 3 adet kalıcı sızma, 2 adet hematoma ve 1 adet egzersiz sonrası bacak ağrısı bildirimi dâhil olmak üzere muhtemelen cihazla ilgili ciddi olmayan 6 adet olay gözlemlendi.

2. Bölümde tedavisi başarısız olarak kabul edilen 3 hasta vardı: 2'si kompresyon kullanılmadan hemostaz elde edilememesi nedeniyle ve 1'i majör vasküler komplikasyon (psödoanevrizma) nedeniyle. Çalışmanın 1. Bölümünde başarısız tedavi görülmemiştir.

Çalışmanın 2. Bölümündeki altı cihaz arızasından üçü prosedüre müdahale etmedi, biri kullanıcı hatasına atfedildi, biri giriş setinden kaynaklanan bir sızıntıydı ve biri de kırık bir filament eklemiydi. Son iki sorun C11202'de uygulanmış olan model güncellemeleri ile giderilmiştir.

Pazar öncesi klinik çalışmanın 2. Bölümü, hastanın uyumsuzluğundan kaynaklanan 6 aylık takip sonuçlarını rapor etmemiştir. Klinik literatürün takip süresiyle uyumlu olan pazar öncesi klinik çalışma (EU-SE-001) 30 günlük sonuçları, FemoSeal™ VCS'in güvenli ve etkili olduğunu göstermektedir.

#### 1.4.2 Pazarlama Sonrası Klinik Çalışmalardan Elde Edilen Verilerin Özeti

Aşağıdaki **Tablo 1.6**'da açıklanan, tamamlanmış 4 adet pazarlama sonrası klinik çalışma bulunmaktadır. Bu klinik araştırmalar yayınlanmamıştır veya çevrimiçi olarak sunulmamaktadır.

**Tablo 1.6 Pazarlama Sonrası Klinik Çalışmalar**

|--|--|--|--|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

2006 çalışması, geliştirilmiş uygulama cihazı ile mevcut cihazın güvenliğini ve etkililiğini doğrulamak ve FemoSeal™ VCS Kullanım Talimatı ve eğitim programı hakkında geri bildirim almak için yapılmıştır. Çalışmaya 100 hasta dahil edilmiştir ve birincil sonlanım noktası hemostaz sağlanıp sağlanmadığı veya ek manuel veya mekanik kompresyonlara ihtiyaç duyulup duyulmadığıydı. Bu çalışma FemoSeal™ VCS uygulamasının vakaların çoğunda başarılı olduğu sonucuna varmıştır (%91'inde anında hemostaz sağlamıştır).

2008 çalışmasına, 7 Fr kılıfıyla kardiyak kateterizasyon uygulanan hastalarda normal klinik rutin sırasında kullanıldığında FemoSeal™ VCS'nin güvenlik ve performansını değerlendirmek için 50 hasta alındı. Çalışmanın birincil sonlanım noktası hemostaz süresi ve ek kompresyon, manuel veya mekanik olmadan ambülasyon süresi ile ilgili veri toplamaktır. Çalışma sonuçlarına göre, ortalama hemostaz süresinin 57,8 saniye olduğu ve tüm hastaların 4 saat yatak istirahatinden sonra ambüle olduğuna ulaşılmıştır.

2009 yılında yapılan çalışma yeni FemoSeal™ VCS ambalajını değerlendirmek için yapılmıştır. Çalışmaya 25 hasta alınmıştır. Birincil sonlanım noktası, kullanıcının paketle ilgili herhangi bir sorun yaşayıp yaşamadığıydı. Kullanıcılar yeni FemoSeal™ VCS paketiyle ilgili herhangi bir sorun görmedi. Bu çalışma ile aynı zamanda hemostaz süresi için de veri toplamıştır.

2022 tarihinde yapılan çalışmanın amacı, FemoSeal VCS'nin perkütan endovasküler prosedürler uygulanan gerçek dünya gönüllülerinde ortak femoral arter (CFA) erişim bölgelerinin hemostazının elde edilmesinde güvenliliğine ve etkililiğine dair verileri proaktif olarak toplamaktır. Çalışmaya 230 hasta alınmıştır. Kayıt için birincil sonlanım noktaları prosedürel başarı (yani başarılı ponksiyon bölgesi hemostazı) ve majör komplikasyonlarda azalmadır (örneğin, vasküler yaralanma, erişim bölgesi ile ilgili kanama, erişim bölgesi enfeksiyonu, tekrarlayan manuel kompresyon ve yeni erişim bölgesi ile ilişkili ipsilateral akut bacak iskemisi). Çalışma, FemoSeal™ VCS'nin gerçek dünya ortamlarında iyi performans gösterdiği ve periferik endovasküler müdahaleler uygulanan hastalarda etkili hemostaz ve düşük erişim bölgesi komplikasyon oranları sağladığı sonucuna varmıştır. FemoSeal™ VCS, kısa hemostaz süresi ve

iyi operatör kullanılabilirlik geri bildirimleri ile iyi bir performans sergilemektedir; bu da onu femoral erişim kapatma açısından değerli bir cihaz hâline getirmektedir.

### 1.4.3 Pazarlama Sonrası Klinik Takipten Elde Edilen Verilerin Özeti

#### 1.4.3.1 Tamamlanan Pazarlama Sonrası Klinik Takip

Tamamlanan pazarlama sonrası klinik takip faaliyetlerinin bir özeti, aşağıdaki **Tablo 1.7'de** açıklanmıştır.

**Tablo 1.7. Pazar Sonrası Klinik Takip Faaliyetleri**

Terumo Medical Corporation, mevcut raporlama döneminde (1 Eylül 2019-31 Ağustos 2024) üç tane yüksek kaliteli doktor kullanıcı araştırması tamamladı.

FemoSeal™ Klinik Araştırmaları, klinik kullanım sırasında FemoSeal™ VCS'nin güvenliği ve performansı ile ilgili proaktif klinik verileri toplamıştır. Araştırma, 0,038 inç kılavuz tel dahil olmak üzere genel cihaza ve ilgili aksesuarlara ve bunların doğrudan etkileşimlerine odaklanan sorular içeriyordu. Kılavuz tel klinik araştırmaları, FemoSeal™ VCS ile birlikte verilen 0,038 inç kılavuz telin klinik kullanımı sırasında güvenlik ve performansla ilgili proaktif klinik verileri toplamıştır. Araştırma soruları, kılavuz telin çıkarılmasıyla, prosedür kılıfının vaskülatüre yerleştirilmesinden başlayıp, kılavuz telin genel kullanımına odaklanmıştır.

Cihazla birlikte verilen FemoSeal™ VCS ve 0,038 inç kılavuz tel, tüm kabul edilebilir derecelendirmeleri almıştır ve yüksek kaliteli klinik araştırmalardan alınan yorumların değerlendirilmesine dayanarak cihaz için altı (6) şikâyet ve kılavuz tel için dokuz (9) şikâyet kaydedilmiştir. Şikâyetler hem FemoSeal hem de kılavuz tel için değerlendirmeye tabi tutulmuştur ve Terumo pazarlama sonrası gözetim sürecinin bir parçası olarak değerlendirilmiştir. Tanımlanan yeni bir risk ve/veya risk seviyesi yoktu.

PMCF faaliyetlerinin bir parçası olarak 2024 yılında bir doktor kullanıcı araştırması tamamlandı. Araştırma sonuçları, FemoSeal™ VCS performans derecelendirmesinin ve güvenliğinin genel olarak oldukça olumlu olduğunu göstermiştir. FemoSeal™ VCS ile birlikte sağlanan standart telin dışındaki kılavuz tellerin uyumluluğu da gösterilmiştir.

#### 1.4.3.2 Devam Eden/Planlanan Pazarlama Sonrası Klinik Takip

TMC'nin devam eden/planlanan bir adet pazarlama sonrası klinik takip faaliyeti vardır. FemoSeal VCS'nin AB pazarında dağıtılması ile kılavuz telin kullanımıyla ilgili prospektif olarak geri bildirim toplamak için bir klinik araştırma yapılacaktır. Araştırma, doktorlar tarafından prosedür sırasında hangi kılavuz telleri kullandıklarını araştırmak için tamamlanacaktır. Bu araştırmanın amacı, FemoSeal™ VCS'nin Terumo dışındaki markalara ait diğer kılavuz tellerin kullanımı ile uyumluluğu hakkında literatür ve haricî inceleyci yorumu eksikliği olarak tanımlanan bir boşluğu ele almaktır. Geri bildirim, cihazın farklı kılavuz tellerle performansı ile ilgili teknik sonuçları, klinik performansı ve güvenliği içerir.

#### 1.4.4 Sistematik Literatür İncelemesinden Elde Edilen Verilerin Özeti

Terumo Medical Corporation, FemoSeal™ VCS ve/veya benzer cihazlar hakkında yayımlanan çalışmalardan elde edilen klinik güvenilirlik ve performans verilerini toplamak ve değerlendirmek için sistematik literatür taramaları gerçekleştirmektedir. Yayımlanan literatürün yıllık olarak taranmasının amacı; daha önce bilinmeyen yan etkileri tanımlamak, bilinen yan etkileri izlemek, ortaya çıkan riskleri belirlemek ve FemoSeal™ VCS'nin olası sistematik yanlış kullanımını veya etiket dışı kullanımını tespit etmektir.

1 Eylül 2019 - 31 Ağustos 2024 dönemini kapsayan en son sistematik literatür taramasında, FemoSeal™ VCS hakkında klinik güvenilirlik ve performans verileri sağlayan 29 yayımlanmış çalışma belirlenmiştir. Yirmi üç referans, dokuz çalışmada FemoSeal™ VCS'nin etiket üzeri kullanımını ve etiket dışı kullanımını bildirmiştir. Genel olarak, FemoSeal™ VCS kullanımına özel çalışmaların literatür incelemesi, AB'de perkütan vasküler kateterizasyon prosedürleri uygulanan hastaları temsil eden bir çalışma popülasyonunu göstermektedir. Hakem denetiminden geçmiş olan bu 23 etiket üzeri yayının listesi için **Bölüm 3'e** bakın.

Klinik performans aşağıdaki ölçütlerle değerlendirilmiştir:

- Perkütan ortak femoral arter kapatma işlemi için hemostaz süresi, Son Teknoloji'den daha iyi veya ona benzerdir.

- Ortak femoral arterin perkütan olarak kapatılması için ambülasyon süresi, Son Teknoloji'den daha iyi veya ona benzerdir.
- Postoperatif komplikasyon oranı, mevcut bakım standartlarına benzer veya ondan daha düşüktür.

Bu klinik performans ölçümlerine dayanarak, bu literatür incelemesinde FemoSeal™ VCS'nin 7 Fr veya daha küçük bir prosedür kılıfı kullanılarak perkütan kateterizasyon uygulanan hastalarda femoral arter ponksiyonunun (arteriyotomi) kapatılmasında başarıyla kullanılabileceğini göstermiştir. Vakalardaki hastaların çoğunluğunda (%79,65-100) tam hemostaz sağlandı ve medyan hemostaz süresi 0,5 dakika ve ortalama taburcu olma süresi ise 3 gündü. Hastaların %69,2-86,7'si, ortalama 349 dakikalık ameliyat sonrası yatak istirahati ile kapatma işleminden 5 saat sonra ambüle edilebilmiştir. Vakaların %3,68-4'ünde FemoSeal™ VCS arızası gözlenmiştir ve prosedürlerin %0,9-4,4'ünde ek manuel kompresyon gerekli olmuştur.

Klinik güvenlik, aşağıdakiler dahil ancak bunlarla sınırlı olmamak üzere advers olaylarla değerlendirilmiştir:

- Kanama
- Hematom
- Psödoanevrizma
- Morluk
- Arteriyovenöz Fistül
- Enfeksiyon
- Ölüm

Dâhil edilen çalışmalarda bu advers olayların her biri için FemoSeal™ VCS'de bildirilen görülme oranı, manuel kompresyon ve diğer vasküler kapatma cihazları için geçmişte bildirilen orandan daha az veya buna benzer olmuştur.

10 vaka raporu gözden geçirilerek herhangi bir advers olay belirlenmemiştir çünkü yeni, beklenmeyen, ortaya çıkan veya kabul edilemez riskler tespit edilmemiştir.

Tanısal anjiyografi veya girişimsel operasyonları sırasında FemoSeal™ VCS kullanımının genel etkinliği; cinsiyet, yaş, hasta anatomisi, komorbiditeler gibi çeşitli faktörlere bağlıdır, ponksiyon bölgesinin anatomik yerleşimi, cerrahın deneyimi, VCD yerleştirme yöntemi ve ameliyat sonrası bakım gibi birden fazla etmene bağlıdır. Hemostazın sağlanması da dâhil elde edilen teknik başarıya ek olarak FemoSeal™ VCS, femoral arter ponksiyonundan sonra vasküler kapatmaya göre hemostaz süresinin kısılması ve ambülasyon süresinin kısılması gibi klinik faydalar sağlamıştır. FemoSeal™ VCS'nin performans sonuçları, amaçlanan şekilde kullanıldıklarında bu tür cihazlar için beklenenlerle tutarlıdır. Mevcut arama dönemi sırasında elde edilen referanslardan bazıları, çalışma konusu cihazın ortak femoral arter dışındaki anatomik bir konumda ve >7 Fr arteriyotomilerin kapatılması için kullanıldığını göstermiştir. Bu durum, etiket dışı olarak kabul edilir.

Gözden geçirme sırasında cihazın bilinmeyen yan etkileri, ortaya çıkan riskleri veya olası sistematik yanlış kullanımı tespit edilmemiştir. Ancak FemoSeal™ VCS eğitimli doktorlar tarafından dikkatli bir şekilde kullanılırsa tıbbi cihaz yararlı ve gerekli bir klinik cihaz olarak işlevini yerine getirecektir. Genel olarak hedef tedavi ve dolayısıyla FemoSeal™ VCS, vasküler erişimle ilgili komplikasyonların tedavisinde şu anda mevcut olan klinik ihtiyacı gidermektedir.

Genel olarak, bu literatür taramasındaki veriler, klinik ortamda daha önce bilinmeyen herhangi bir performans veya güvenlik sorununu veya beklenenden daha yüksek / kabul edilebilir oranlarda meydana gelen advers etkileri tanımlamamıştır. Bu nedenle bu literatür taramasından, FemoSeal™ VCS'nin perkütan kateterizasyonu takiben arteriyotomide hemostaz için kompresyon sağlamak amacıyla kullanıldığında beklendiği gibi performans göstermeye devam ettiği ve ciddi güvenlik olaylarıyla ilişkili olmadığı sonucuna varılabilir.

#### 1.4.5 Pazarlama Sonrası Gözetimden Elde Edilen Verilerin Özeti

Proaktif bir PMS sistemi mevcuttur ve tüm şikâyetler aylık olarak ve dâhilî üretim prosedürlerine uygun şekilde incelenir. Şikâyet verileri, 1 Eylül 2019 - 31 Ağustos 2024 tarihleri arasında analiz edilmiştir. Genel olarak, 28 Tıbbi Cihaz Vijilans (MDV) Raporu ve 476 müşteri şikâyet raporu üretici firmaya sunuldu. Sunulan 28 MDV raporundan 27'si advers olaylarla, bir tanesi ise cihaz arızasıyla ilgiliydi. Raporlama döneminde iki ölüm yaşandı ancak bildirilen ölümlerin hiçbirinin çalışma konusu cihazla ilgili olmadığına karar verildi. Üretici firmaya yapılan 476 şikâyet arasında en yaygın şikâyet nedenleri yerleştirme zorluklarıydı (146 olay, %0,0142 oluşma oranı). Çıkma olaylarının arıza türü, %0,0126 (130 olay) oranıyla en sık oluşan ikinci durumdur.

FemoSeal™ Vascular Closure System'in dünya çapında 1.030.136'dan fazla satışı ve Avrupa Ekonomik Alanı'nda 827.843 satışı gerçekleşmiştir. Küresel satışlara dayalı şikâyetlerin hesaplanan sıklığı %0,046'dır. Genel müşteri şikâyet oranı çok düşüktür. Kullanım Talimatlarında ve risk dokümantasyonunda yer almayan yeni riskler belirlenmemiştir.

İstenmeyen yan etkilerin görülme oranları **Tablo 1.2'de** gösterilmiştir. Şikâyet yoluyla hiçbir yeni, beklenmeyen, ortaya çıkan veya kabul edilemez risk belirlenmemiştir. Bilinen istenmeyen yan etkilerin sıklığında veya şiddetinde önemli bir artış görülmemiştir.

#### 1.4.6 Genel Klinik Performans ve Güvenlilik Özeti

FemoSeal™ VCS, 7F (2,33 mm) veya daha küçük bir prosedürel kılıf kullanılarak perkütan kateterizasyon yapılan hastalarda ortak femoral arter ponksiyonunun (arteriyotomi) kapatılmasında kullanılır. Bu klinik değerlendirme, FemoSeal™ VCS'nin kullanım amacı ile ilgili mevcut pazarlama öncesi ve sonrası klinik verilerin ve literatürün kapsamlı bir analizine dayanmaktadır.

1 Eylül 2019 ile 31 Ağustos 2024 arasındaki dönemi kapsayan kapsamlı bir yayımlanmış literatür incelemesi gerçekleştirilmiştir. Elde edilen kanıtlar, FemoSeal™ VCS ile ilgili 29 çalışmayı içermiştir. Klinik değerlendirmede sağlanan kanıtlar, çalışma konusu cihazın endike

olduğu şekilde kullanıldığında güvenli ve etkili olduğunu ve normal kullanım koşulları altında cihazla ilişkili olabilecek herhangi bir risk veya istenmeyen yan etkinin, hastaya sağlanan faydalarla karşılaştırıldığında kabul edilebilir risk teşkil ettiğini ortaya koymaktadır. Çalışma konusu cihazların performans sonuçları, amaçlanan şekilde kullanıldıklarında bu tür cihazlar için beklenenlerle tutarlıdır.

FemoSeal™ VCS kullanımı ile ilişkili potansiyel istenmeyen yan etkiler, kanama ve hematoma gibi arteriyotomi kapatmanın alternatif yollarıyla yaygın olarak bildirilen advers olayları içerir. Genel olarak, FemoSeal™ VCS kullanımıyla bildirilen advers olayların meydana gelme oranları, manuel kompresyon ve benzer vasküler kapatma cihazlarıyla bildirilen oranlara benzerdir. Özellikle, kanama ve hematoma açısından FemoSeal™ VCS için bildirilen oranlar, benzer vasküler kapatma cihazları için bildirilen oranlardan daha düşüktür. Hem yayımlanan literatürden hem de pazarlama sonrası gözetimden bildirilen advers olayların her biri önceden tanımlanmıştır (bk. **Bölüm 1.3**).

FemoSeal VCS'nin klinik güvenlik ve performansına ilişkin mevcut veriler, bu vasküler kapatma cihazının kullanımından elde edilen hastalara olan yararların, Kullanım Talimatları uyarınca kullanıldığında ortaya çıkacak olası risklerden daha ağır bastığını göstermektedir.

Yukarıdaki bölümlerde belirtildiği gibi FemoSeal™ VCS için sağlanan veriler; değerlendirilen cihazla ilgili veriler (örneğin cihaz kullanımı, güvenlik sonuçları, klinik performans ve klinik faydalar), tespit edilen eş değer cihazlar ve Son Teknoloji çalışmasında listelenen benzer cihazlarla ilgili veriler arasındaki tutarlılığı göstermektedir.

Güvenlilik verilerinin çapraz analizi sonucunda aşağıdakiler arasında herhangi bir boşluk tespit edilmemiştir:

- Son Teknoloji çalışmasında belirtilen veriler
- Değerlendirilen cihaza özel veriler
- Risk Yönetimi Dosyalarında belirtilen veriler
- Etiket ve/veya kullanım talimatlarında belirtilen veriler (örneğin, kullanıcıya iletilecek rezidüel riskler).

Yayımlanmış, hakem denetiminden geçmiş klinik literatürde, şirket sponsorluğundaki klinik çalışmalarda ve pazarlama sonrası verilerin incelemesinde tespit edilen düşük komplikasyon oranlarıyla ve piyasadan geri çekmenin olmamasıyla klinik güvenlik kanıtlanmıştır.

Performansla ilgili herhangi bir endişe tespit edilmemiştir ve taranan literatürde FemoSeal™ VCS'nin üretici firmanın kullanım amacı ile tutarlı şekilde kullanıldığı görülmüştür.

## 1.5 Olası Tanı veya Tedavi Alternatifleri

Manuel kompresyon, geleneksel olarak vasküler kateterizasyonlardan sonra arteriyotomi bölgesinde hemostaz sağlamak için kullanılır. Manuel kompresyon, hastanın uzun süre (prosedürden sonra 8 saate kadar) hareketsiz kalmasıyla ve önemli rahatsızlık ve uzun hastanede kalış süreleriyle ilişkilendirilmiştir. Yakın zamanda gerçekleştirilen bir sistematik inceleme, manuel kompresyonla hemostazın sağlanması için medyan sürenin 20,8 dakika olduğunu ortaya koymuştur.<sup>1</sup>

Manuel kompresyona alternatifler, arteriyotomi bölgesine mekanik kompresyon uygulayan harici hemostatik cihazları içerir. Bu cihazlar hemostaz süresini veya ambülasyon süresini kısaltmaz, ancak manuel sıkıştırmayı mekanik sıkıştırma ile değiştirerek personel gereksinimlerini azaltır. Mekanik kompresyon kullanımı ile ilişkili advers olay oranları, manuel kompresyon ile ilişkili oranlara benzerdir.

FemoSeal™ VCS gibi vasküler kapatma cihazları, arteriyotomiye kapatmak için tasarlanmıştır. Hemostaz süresini kısaltmayı ve daha erken ambülasyon sağlamayı hedeflemektedirler. Piyasada bulunan 13 cihazı içeren yakın zamanda gerçekleştirilen bir sistematik inceleme, vasküler kapatma cihazı ile hemostazın sağlanması için medyan sürenin 5,4 dakika olduğunu ortaya koymuştur. Cihazların çoğu 4 ile 10 dakika arasında olacak şekilde her bir vasküler kapatma cihazı için medyan hemostaz süresi 1 dakika (FemoSeal™ VCS) ile 14 dakika arasında değişmiştir.<sup>1</sup>

Arteriyotomi bölgesinin kapanması, manuel kompresyonlar, eksternal hemostatik cihazlar veya vasküler kapama cihazları ile ilişkili olarak sık bildirilen advers olaylar arasında hematoma, erişim bölgesinde kanama, psödoanevrizma, arteriyovenöz fistül ve enfeksiyon sayılabilir. Aynı sistematik incelemede (34 randomize kontrollü çalışma, 14.401 hasta), kanamanın vasküler kapatma cihazlarında biraz daha yüksek olma eğiliminde olması dışında, manuel kompresyon ile vasküler kapatma cihazlarının kullanımı arasında advers olay oranlarının benzer olduğu görülmüştür.<sup>1</sup>

## 1.6 Önerilen Kullanıcı Profili ve Eğitimi

FemoSeal™ Vascular Closure System cihazının amaçlanan kullanıcıları, ortak femoral arter yoluyla endovasküler prosedürler için arteriyel erişim ve kapama gerçekleştirme konusunda eğitim almış ve Terumo Medical Corporation FemoSeal™ doktor eğitim programına katılmış doktorlardır.

### 1.7 İlgili Uyumlaştırılmış ve Ortak Standartlar

| Standart Referans | Geçerli Uyumluluk Yılı/Rev | Açıklama                                                                                                                                 |

Цей огляд безпеки та клінічних характеристик (SSCP) призначений для надання публічного доступу до оновлених даних щодо основних аспектів безпечності та клінічної ефективності системи для закриття місця пункції судини (vascular closure system, VCS) FemoSeal™.

Стислий огляд даних щодо безпечності та клінічної ефективності пристрою, призначений для користувачів/медичних працівників, наведений в **розділі 1.0**.

## **1.0 ІНФОРМАЦІЯ ДЛЯ КОРИСТУВАЧІВ / МЕДИЧНИХ ПРАЦІВНИКІВ**

SSCP не замінює інструкції із застосування, що є основним документом, призначеним для забезпечення безпечного використання пристрою, і не містить рекомендацій для користувачів або пацієнтів щодо діагностики чи лікування. SSCP не призначений для заміни обов'язкової інформації, що зазначається в картках з інформацією про пацієнта з імплантатом або в будь-яких інших обов'язкових документах.

### **1.1 Призначення пристрою**

#### **1.1.1 Показання до застосування**

Система для закриття місця пункції судини FemoSeal™ — це медичний пристрій, призначений для закриття місця проколу артерії після черезшкірної катетеризації через загальну стегнову артерію.

#### **1.1.2 Показання до застосування**

Система для закриття місця пункції судини FemoSeal™ використовується для закриття місця проколу загальної стегнової артерії (артеріотомії) у пацієнтів, які пройшли черезшкірну катетеризацію з використанням інтродьюсера 7F (2,33 мм) або меншого розміру.

#### **1.1.3 Протипоказання та/або обмеження**

Система для закриття місця пункції судини FemoSeal™ протипоказана до використання у пацієнтів з артеріотоміями, в яких застосовувалися інтродьюсери або пристрої розміром більше 7F (2,33 мм).

#### **1.1.4 Цільова популяція пацієнтів**

Безпечність та ефективність системи для закриття місця пункції судини FemoSeal™ оцінювалися у пацієнтів віком від 18 років, які пройшли черезшкірну катетеризацію з використанням інтродьюсера 7F (2,33 мм) або меншого розміру.

#### **1.1.5 Окремі категорії пацієнтів**

Безпечність та ефективність системи для закриття місця пункції судини FemoSeal™ не встановлені для таких категорій пацієнтів:

- Пацієнти з існуючим аутоімунним захворюванням.
- Пацієнти, яким проводиться процедура тромболізу.
- Пацієнти з клінічно вираженим захворюванням периферичних судин.

- Пацієнти з неконтрольованою артеріальною гіпертензією (систолічний тиск > 220 мм рт. ст. або діастолічний тиск > 110 мм рт. ст.).
- Пацієнти з порушенням згортання крові, включаючи тромбоцитопенію (кількість тромбоцитів < 100 000) або анемію (гемоглобін < 10 мг/дл).
- Пацієнти з внутрішнім просвітом загальної стегнової артерії діаметром менше 5 мм.
- Пацієнти з нирковою та/або печінковою недостатністю.
- Пацієнти з іншими релевантними супутніми захворюваннями.
- Пацієнти певного расового та/або етнічного походження.
- Пацієнти з інфарктом міокарда протягом останніх 72 годин.
- Пацієнти з судинним трансплантатом або стентом в місці проколу.
- Вагітні жінки та жінки, що годують груддю.
- Пацієнти віком до 18 років.

### 1.1.6 Призначені користувачі

Призначеними користувачами системи для закриття місця пункції судини FemoSeal™ є лікарі, які отримали належну підготовку з виконання артеріального доступу через загальну стегнову артерію та закриття місця пункції в рамках ендоваскулярних процедур і пройшли спеціальний інструктаж із застосування пристрою FemoSeal™ від компанії Terumo Medical Corporation.

## 1.2 Опис пристрою

### 1.2.1 Опис виробу

Система для закриття місця пункції судини FemoSeal™ виробництва Terumo Medical Corporation (TMC) — це виготовлений з матеріалу, що розсмоктується, пристрій для закриття судин, призначений для досягнення гемостазу стегнової артерії після черезшкірної катетеризації через загальну стегнову артерію.

Місце проколу судини закривається елементами системи FemoSeal™, які складаються з двох полімерних дисків, що розсмоктовуються, а саме з внутрішнього герметизувального елемента та зовнішнього блокувального диска, які утримуються разом за допомогою розсмоктуваного мультифіламентного шовного матеріалу. Таким чином, місце артеріотомії закривається механічно (див. **малюнок 1.1** і **малюнок 1.2**). Після розгортання

через конічну захисну канюлю зовнішній блокувальний диск просувається по шовному матеріалу і притискається до місця проколу, що призводить до механічного закриття місця проколу внутрішнім герметизувальним елементом і зовнішнім блокувальним диском. Внутрішній герметизувальний елемент та зовнішній блокувальний диск утримуються на місці завдяки мультифіламентному шовному матеріалу. Гемостаз досягається механічним шляхом. Запірні компоненти системи розкладаються шляхом гідролізу.

Запірні компоненти системи, що імплантуються — внутрішній герметизувальний елемент та зовнішній блокувальний диск — розкладаються через вісімнадцять (18) місяців, а мультифіламентний шовний матеріал розкладається шляхом гідролізу та поглинається навколишньою тканиною приблизно через два (2) або три (3) роки. Здатність запірних компонентів, що імплантуються, підтримувати компресію в місці артеріотомії перевірялася протягом восьми (8) годин. Продукти розпаду метаболізуються та виводяться із сечею або виділяються у вигляді вуглекислого газу через легені. В дослідженнях на тваринах ефектів накопичення не спостерігалось. Додатковими компонентами системи FemoSeal™, які контактують з живою тканиною або кров'ю під час процедури, є конічна захисна канюля, розширювач, трубка для тампонування, штовхач і провідник.

**Малюнок 1.1 Внутрішній герметизувальний елемент і зовнішній блокувальний диск, відповідно**

**Малюнок 1.2 Внутрішній герметизувальний елемент і зовнішній блокувальний диск в розгорнутому вигляді**

Пристрій FemoSeal™ поставляється в одній упаковці з розширювачем, провідником із зовнішнім діаметром 0,038 дюйма (0,97 мм) і довжиною 27,5 дюйма (70 см) і J-подібним випрямлячем, див **малюнок 1.3** нижче. Провідник міститься в поліетиленовій трубці. Усі частини пристрою вкладені у паперовий лоток, зафіксований всередині упаковки. В упаковці також міститься картка для зазначення інформації про пацієнта з імплантатом. Для належного функціонування система для закриття місця пункції судини FemoSeal™ не потребує додаткових допоміжних пристроїв, окрім розширювача та провідника, що поставляються в комплекті з виробом.

**Малюнок 1.3 FemoSeal™ VCS з провідником і розширювачем**

### 1.2.2 Матеріали та компоненти

В **таблиці 1.1** нижче перераховані компоненти системи FemoSeal™ VCS.

**Таблиця 1.1 Матеріали та компоненти системи FemoSeal™ VCS**

\* Частина пристрою, що імплантується; компоненти, що імплантуються, безпечні для МРТ

FemoSeal™ VCS є одноразовим медичним виробом, який стерилізовано гамма-опроміненням. Пристрій FemoSeal™ VCS сконструйований таким чином, що його не можна використовувати повторно.

## **Спосіб дії**

FemoSeal™ VCS забезпечує механічний гемостаз шляхом розміщення імплантованих запірних елементів всередині та ззовні загальної стегнової артерії. Механізм, що запобігає кровотечі, реалізується завдяки внутрішньому герметизувальному елементу, що закриває місце проколу, і зовнішньому блокувальному диску, який утримує внутрішній герметизувальний елемент в потрібному положенні.

### **1.2.3 Клінічна перевага**

Відносно закриття судини після пункції загальної стегнової артерії FemoSeal™ VCS має такі клінічні переваги:

- Скорочення часу до досягнення гемостазу<sup>1</sup>
- Скорочення часу до відновлення здатності пацієнта пересуватися<sup>1</sup>

1. Cox, T., Blair, L., Huntington, C., Lincourt, A., Sing, R., & Heniford, B. T. (2015). *Systematic Review of Randomized Controlled Trials Comparing Manual Compression to Vascular Closure Devices for Diagnostic and Therapeutic Arterial Procedures. Surgical technology international*, 27, 32–44.

### **1.2.4 Попередні покоління або варіанти пристрою**

- Перша версія пристрою FemoSeal™ VCS (№11200) продавалася на європейському ринку протягом 2005 і частково 2006 років.
- Поточна версія пристрою FemoSeal™ VCS (№11202) з покращеною системою доставки представлена на ринку з 28 березня 2006 року.

### **1.2.5 Приналежності, призначені для використання з виробом**

Пристрій FemoSeal™ поставляється в одній упаковці з розширювачем, провідником із зовнішнім діаметром 0,038 дюйма (0,97 мм) і довжиною 27,5 дюйма (70 см) і J-подібним випрямлячем. Провідник — це єдина приналежність, призначена для використання з пристроєм FemoSeal™. J-подібний випрямляч є компонентом провідника, а розширювач є компонентом пристрою FemoSeal™. Тому приналежністю вважається тільки провідник. Провідник міститься в поліетиленовій трубці. Усі частини пристрою вкладені у паперовий лоток, зафіксований всередині упаковки. В упаковці також міститься картка для зазначення інформації про пацієнта з імплантатом. Для належного функціонування система для закриття місця пункції судини FemoSeal™ не потребує додаткових допоміжних пристроїв, окрім розширювача та провідника, що поставляються в комплекті з виробом.

### **1.2.6 Інші пристрої та продукти, призначені для використання з цим виробом**

FemoSeal™ VCS не потребує додаткових пристроїв для належного функціонування.

### 1.3 Ризики та попередження

#### 1.3.1 Залишкові ризики та небажані ефекти

Відомі або передбачувані побічні явища, шкода здоров’ю та ускладнення, пов’язані з використанням системи FemoSeal™ VCS в результаті залишкових ризиків, перераховані в **таблиці 1.2**. Частоту розраховано на основі результатів аналізу даних про ризики та даних післямаркетингового нагляду з 1 вересня 2019 року по 31 серпня 2024 року. Застосування FemoSeal™ VCS не пов’язане з невідомими залишковими ризиками, а всі відомі ризики перераховані у відповідній інструкції із застосування та враховані в процесі управління ризиками.

**Таблиця 1.2. Побічні явища/ускладнення при застосуванні FemoSeal**

| Шкода здоров’ю           | Частота виникнення (%) | Пом’якшувальні фактори                                                                                                                                                         |

### 1.3.2 Попередження й заходи безпеки

#### Попередження

1. Не використовуйте, якщо упаковку пошкоджено або стерильну бар'єрну систему порушено.
2. Не використовуйте після закінчення терміну придатності: функціональні характеристики біорозкладних компонентів можуть змінитися.
3. Не використовуйте, якщо якісь елементи виглядають пошкодженими або мають дефекти.
4. Використання системи FemoSeal™ у випадку ймовірності бактеріального забруднення інтродьюсера або навколишніх тканин може призвести до інфікування.
5. В разі підозри на прокол задньої стінки артерії або за необхідності декількох проколів не слід обмежуватися тільки системою FemoSeal™ для досягнення артеріального гемостазу. Додатково застосовуйте ручну або механічну компресію.
6. Якщо місце пункції знаходиться в області біфуркації стегнової артерії або дистальніше області біфуркації, систему FemoSeal™ не слід використовувати через ризик неправильного розташування внутрішнього герметизувального елемента. Це явище може призвести до ускладнень у вигляді кровотечі та/або порушення нормального кровотоку.
7. В разі стійкої артеріальної кровотечі з місця розрізу не відрізайте мультифіламентний шовний матеріал, доки не буде досягнуто гемостазу. Якщо гемостазу не досягнуто, закріпіть мультифіламентний шовний матеріал стерильною

раневою пов'язкою та застосуйте додаткову компресію до досягнення гемостазу. В разі стійкої артеріальної кровотечі можуть виникнути значні ускладнення, які можуть призвести до травмування або смерті пацієнта.

8. Не використовуйте систему FemoSeal™, якщо місце пункції знаходиться проксимальніше пахової зв'язки, оскільки це може призвести до заочеревинної гематоми.
9. Пацієнти з високим ризиком кровотечі можуть страждати від підвищеної втрати крові, що вимагає переливання крові.
10. Від'єднання внутрішнього диска потенційно може спричинити тромбоз та/або емболію.

### **Заходи безпеки**

1. Процедуру розгортання системи FemoSeal™ мають виконувати лікарі, які пройшли належну підготовку з використання цього пристрою.
2. Перед розгортанням системи FemoSeal™ виконайте обмежену ангіографію стегнової артерії або пункцію стегнової артерії під ультразвуковим контролем.
3. В нижченаведених випадках процедуру слід припинити:
  - Діаметр просвіту загальної стегнової артерії < 5 мм.
  - Стеноз та/або значні атеросклеротичні відкладення поблизу місця пункції загальної стегнової артерії.
  - Пункція виконується в області біфуркації стегнової артерії або дистально від області біфуркації.
  - Аномальні гілки артерії або судинні аномалії поблизу місця пункції загальної стегнової артерії.
4. За наявності гематоми слід проявляти особливу ретельність, щоб правильно ввести конічну захисну канюлю в артерію.
5. Застосовуйте техніку пункції однієї стінки. Не проколуйте задню стінку артерії.
6. При використанні системи FemoSeal™ завжди дотримуйтесь стерильності.
7. Система FemoSeal™ призначена лише для одноразового використання. Її не можна використовувати повторно або будь-яким способом повторно стерилізувати. Пристрій FemoSeal™ сконструйований таким чином, що його не можна використовувати повторно.
8. Якщо під час розгортання внутрішнього герметизувального елемента відчувається неочікуваний опір, припиніть процедуру.

9. Для правильного розгортання внутрішнього герметизувального елемента перемістіть великий палець так, щоб кнопка могла вільно повертатися у вихідне положення.
10. Перш ніж розгорнути зовнішній блокувальний диск, переконайтеся, що кінчик конусної захисної канюлі пристрою FemoSeal™ знаходиться під поверхнею шкіри. Зовнішній блокувальний диск може випадково розгорнутись над рівнем шкіри у пацієнтів із короткою відстанню між стегною артерією та шкірою.
11. Для правильного розгортання може знадобитися спочатку виконати розріз шкіри.
12. Якщо внутрішній герметизувальний елемент знаходиться всередині артерії, і при цьому неможливо повністю відтиснути кнопку та розгорнути зовнішній блокувальний диск, може знадобитися хірургічне втручання для видалення запірних елементів системи FemoSeal™.
13. В разі необхідності повторної пункції тієї самої стегнової артерії протягом 18 місяців пункцію слід виконувати щонайменше на відстані одного сантиметра від центральної лінії місця доступу попередньої системи FemoSeal™.
14. Проінструкуйте пацієнта про необхідність дотримуватися вказівок лікаря щодо огляду місця закриття.
15. Проінструкуйте пацієнта про необхідність носити із собою протягом наступних 18 місяців картку з інформацією про пацієнта з імплантатом.

### **Заходи безпеки під час виписки**

Перш ніж розглянути можливість виписки, огляньте пацієнта на наявність таких клінічних станів:

1. Кровотеча та/або гематома в місці закриття.
2. Біль під час ходьби.
3. Ознаки інфекції в місці закриття.

### **1.3.3 Коригувальні дії з експлуатаційної безпеки**

Протягом періоду з 01 вересня 2019 року по 31 серпня 2024 року була проведена одна коригувальна дія з експлуатаційної безпеки, пов'язана з FemoSeal™ VCS.

У 2022 році компанія Terumo добровільно вилучила з використання системи FemoSeal™ VCS через скарги на збої в процесі застосування та у зв'язку з випробуванням системи FemoSeal виробництва Elkton при випуску партії з метою вимірювання зусиль під час тампонування та витягнення. Загалом з обігу в Південній Кореї було вилучено 950 пристроїв.

### 1.4 Клінічна оцінка та післямаркетингове клінічне спостереження

В таблиці 1.3 наведено перелік базових досліджень, проведених з метою отримання системою FemoSeal™ VCS дозволу на широке застосування, а також післямаркетингових досліджень та заходів в рамках післямаркетингового спостереження. Версія пристрою, що використовувалася у відповідному дослідженні, вказана в таблиці нижче. Перша версія FemoSeal™ VCS (№11200) була на ринку до 2006 року. Наступна версія (№C11202), випущена на ринок у 2006 році, представлена на ринку на сьогоднішній день.

| <p>Biocompatibility and Biofunctionality of a Biodegradable Implant to Achieve Haemostasis in the Vascular System. Functional Implantation Test in the Sheep and in the Pig for 5 Weeks, (R1052-01) 2002, Radi Medical System AB (performed by Biomatech, France).</p> | <p>2002<br/>Radi Medical Systems AB<br/>Проводилося компанією Biomatech, Франція</p> | <p>Дослідження на тваринах</p> | <p>Дослідження проводилося з ціллю оцінити біосумісність та біофункціональність біорозкладаного імплантату, призначеного для досягнення гемостазу в судинній системі. Досліджуваний пристрій вводився в отвір проколу в артеріях для досягнення гемостазу. Один диск вводився в прокол артерії, а інший використовувався для закріплення внутрішнього диска із зовнішнього боку артерії. Обидва диски вводилися через канюлю інтродьюсера. Диски призначалися для запобігання кровотечі і подальшого загоєння стінки судини, після чого</p> | <p>Період імплантації / спостереження становив 5 тижнів для всіх тварин</p> <p>4 вівці, 1 свиня</p> <p>14 запірних елементів</p> <p>8 запірних елементів були імплантовані 2 вівцям</p> <p>2 запірних елементи були імплантовані 1 свині</p> <p>Під час імплантації двох запірних елементів в одну стегнову артерію відстань між ними становила &gt; 30 мм</p> | <p>Реєструвалися всі небажані явища (запалення, некроз, крововилив або будь-яке інше ураження) або будь-які випадки утворення тонкого шару псевдоінтими. Особлива увага приділялася початковому етапу інтеграції пристрою в тканину, з особливим акцентом на інкапсуляції внутрішнього диска.</p> <p>Результати макроскопічного дослідження вказували на відсутність значущих ознак місцевої непереносимості або утворення тромбів. Макроскопічне дослідження не виявило різниці між вівцею та свинією після імплантації</p>                   |

|  |  |  | <p>мали розкладатися та поглинатися тканинами. Дослідження проводилося для збору та аналізу даних після функціональної імплантації пристрою вівцям і свиням з метою оцінити здатність імплантату підтримувати фізіологічну функцію при використанні в кровоносній системі, а також вивчити реакцію організму господаря та реакцію пристрою (фізична цілісність, тканинна інкапсуляція на момент забиття) і оцінити розкладання матеріалу імплантату</p> |  | <p>запірних елементів у стегнових артеріях. Результати макроскопічного дослідження вказували на відсутність значущих ознак місцевої непереносимості або утворення тромбів. Макроскопічне дослідження не виявило різниці між вівцею та свинею після імплантації запірних елементів у стегнових артеріях.</p> <p>Гістопатологічний аналіз місця імплантації в овець не виявив місцевих побічних реакцій. Внутрішній та зовнішній диски мали ознаки розкладання і в деяких випадках були розбиті на дрібніші частини. Внутрішні диски були повністю інтегровані в неоінтимальну тканину. У свині гістопатологічний аналіз виявив трохи більше ознак запалення навколо внутрішнього та зовнішнього дисків. У тварин обох видів застосування мультифіламентного шовного матеріалу супроводжувалося більшою кількістю ознак запалення, ніж застосування матеріалу диска, що є нормальним для плетених ниток через їхню більшу площу поверхні.</p> <p>Прохідність судин вимірювали через</p> |

В рамках домаркетингового плану розробки FemoSeal™ VCS було проведено 3 функціональні тести на тваринах. У 2000 році, перед початком клінічних досліджень, було проведене дослідження на тваринах для оцінки біофункціональності FemoSeal™ VCS. В цьому дослідженні оцінювалася здатність запірних елементів підтримувати фізіологічну

функцію, а також розкладання цих елементів. Через 18 місяців матеріал внутрішнього та зовнішнього дисків став непомітним, його замінила ендолумінальна фіброзна тканина. За результатами цього дослідження була підтверджена здатність запірного елемента FemoSeal™ VCS підтримувати фізіологічну функцію під час використання в системі кровообігу.

В 2002 році було проведено дослідження на тваринах з метою оцінити біосумісність та біофункціональність біорозкладаного імплантату, FemoSeal™ VCS, призначеного для досягнення гемостазу в судинній системі. Загалом, розкладання матеріалу імплантату було майже завершено до 36 тижня, при цьому жодної значної побічної реакції з боку тканин не спостерігалось.

Під час іншого проведеного в 2002 році дослідження на тваринах оцінювали біосумісність та біофункціональність біорозкладаного імплантату, FemoSeal™ VCS, призначеного для досягнення гемостазу в судинній системі. Через 5 тижнів інкапсуляція дисків була завершена, мали місце ознаки розпаду матеріалу внутрішніх і зовнішніх дисків. За результатами цього дослідження була підтверджена здатність імплантату підтримувати фізіологічну функцію при використанні в системі кровообігу.

В рамках плану клінічного розвитку FemoSeal™ VCS компанія Radi Medical System AB провела домаркетингове клінічне дослідження. Результати цього дослідження не публікувалися і не викладалися в Інтернет. Дослідження приладу моделі №11200 проводилося в 2002–2004 рр. за європейським стандартом EN 540 (Клінічні дослідження медичних виробів для людей) і відповідно до Загальних принципів проведення клінічних випробувань ІСН та Керівництва з належної клінічної практики. Деталі цього дослідження викладені в звіті EU-SE-001. Результати дослідження описані у фінальному звіті компанії Radi Medical Systems AB «Багатоцентрове клінічне дослідження системи для закриття місця пункції судини FemoSeal для герметизації проколів стегнової артерії після діагностичних/інтервенційних кардіологічних процедур». Клінічне дослідження було проведено з використанням першої моделі FemoSeal™ №11200 і зосереджувалося на безпечності та ефективності запірних компонентів, що імплантуються. Єдиною відмінністю між першою моделлю №11200 і поточною моделлю C11202 є французький калібр, 6F і 7F відповідно, і вдосконалена система доставки. Клінічні переваги, показання до використання, принципи роботи та вихідні матеріали запірних елементів, що імплантуються (внутрішнього герметизувального елемента та зовнішнього блокувального диска), залишаються незмінними.

Пристрій призначався для пацієнтів, які проходили діагностичні або інтервенційні кардіологічні процедури з використанням стегнової артерії як точки доступу. Дослідження проводилося з метою оцінити безпечність, функціональні характеристики та ефективність

FemoSeal™ VCS. Дослідження проводилося як проспективне багатоцентрове відкрите дослідження в одній групі з 30-денним подальшим спостереженням.

Первинною кінцевою точкою ефективності був час до гемостазу, що визначався як відсутність швидкої кровотечі. Первинною кінцевою точкою безпечності була частота серйозних судинних ускладнень протягом 30 днів. Вторинні кінцеві точки включали час до відновлення здатності пересуватися, частоту невдалих процедур, частоту побічних явищ і робочі характеристики пристрою під час доставки та розгортання.

Пацієнти, включені в це дослідження, були дорослими, здатними дати інформовану згоду і придатними для вимірювання частоти пульсу принаймні на одній нозі. Пацієнти виключалися з дослідження за наявності будь-якого з наступних захворювань або станів:

- Захворювання периферичних судин в анамнезі
- Аутоімунне захворювання
- Встановлений розлад згортання крові — тяжка анемія
- МНС >1,5
- Інфаркт міокарда протягом останніх 72 годин
- Неконтрольована артеріальна гіпертензія, незважаючи на лікування
- Ожиріння, що унеможливило доступ за методикою Сельдингера
- Наявність судинного трансплантата або стента в місці артеріотомії
- Попередня іпсилатеральна пункція протягом останніх 3 місяців
- Тривалість життя < 6 місяців

Крім того, пацієнтів обстежували під час операції та виключали з дослідження, якщо спостерігалось будь-що з наступного:

- Діаметр просвіту загальної стегнової артерії < 5 мм
- Гілки артерії в межах 2 см проксимальніше місця пункції
- Виражений стеноз в межах 3 см від місця пункції
- Застосування інтродьюсера > 6 Fr в процесі попередньої процедури
- Пункція в області біфуркації стегнової артерії або дистально від області біфуркації
- Множинні пункції стегнової артерії
- Підтверджений або підозрюваний прокол задньої стінки стегнової артерії

- Велика гематома (2:6 см) після завершення процедури
- Труднощі при введенні інтродьюсера в процесі попередньої процедури через звивистість тканини або судини

Це дослідження проводилося за єдиним протоколом у дві частини: до участі в частині 1 було включено 20 пацієнтів, потім був виконаний аналіз безпечності, після чого ще 60 пацієнтів були включені в дослідження для участі в частині 2.

Середній вік пацієнтів, включених в частину 1, становив 65,9 років, 70,0 % пацієнтів були чоловіками, і 95 % пацієнтів приймали супутні ліки. Середній вік пацієнтів, включених в частину 2, становив 63,8 років, 78 % були чоловіками, і 100 % приймали супутні ліки.

Придатними до участі в дослідженні вважалися пацієнти, які проходили діагностичну (частина 1 і частина 2) або інтервенційну (частина 2) катетеризацію серця. Процедури, що виконувалися пацієнтам в рамках дослідження, відповідали стандартам медичної допомоги в кожній із зареєстрованих лікарень. Після процедури у цих пацієнтів застосовувалася система FemoSeal™ VCS. Дані про пацієнтів збирали на вихідному рівні, під час процедури та через 1 день і 30 днів після процедури. Результати цього дослідження узагальнені в **таблиці 1.5** і вказують на те, що система FemoSeal™ VCS є безпечною і ефективною для використання в цій групі пацієнтів.

**Таблиця 1.5 Клінічні показники, зареєстровані в домаркетинговому дослідженні**

|                                                                                                                      | Частина 1    | Частина 2                 |
|----------------------------------------------------------------------------------------------------------------------|--------------|---------------------------|
| Кількість пацієнтів                                                                                                  | 20           | 60                        |
| Середній час до гемостазу                                                                                            | 1,2 хвилини  | 1,6 хвилини <sup>a</sup>  |
| Середній час до відновлення здатності пересуватися                                                                   | 72,2 хвилини | 87,5 хвилини <sup>b</sup> |
| Частота серйозних судинних ускладнень <sup>c</sup>                                                                   | 0 (0 %)      | 1 (2 %)                   |
| Кількість пацієнтів із побічними явищами                                                                             | 5 (25 %)     | 19 (32 %)                 |
| Неефективність процедури (визначається як серйозні судинні ускладнення, необхідність ручної компресії або те й інше) | 0 (0 %)      | 3 (5 %)                   |
| Несправності пристрою                                                                                                | 0 (0 %)      | 6 (10 %)                  |

*<sup>a</sup>На основі загального розміру вибірки 58 пацієнтів, оскільки у 2 пацієнтів гемостазу під час процедури досягнуто не було через попередні інсультальні пункції. У цих пацієнтів гемостаз був досягнутий через 7 хвилин та 37 хвилин.*

*<sup>b</sup>На основі загального розміру вибірки 59 пацієнтів: 1 пацієнт не був включений, оскільки він був підключений до апарату ШВЛ через набряк легенів і не міг рухатися більше тижня.*

*<sup>c</sup>Визначається як судинне ускладнення, що потребує переливання крові або хірургічного лікування, або місцева інфекція, що потребує введення антибіотиків, госпіталізації або продовження госпіталізації чи хірургічної обробки місця встановлення пристрою*

Під час частини 1 цього дослідження серйозних судинних ускладнень не спостерігалось. В частині 2 цього дослідження було зареєстроване 1 серйозне судинне ускладнення: псевдоаневризма, про яку повідомлялося протягом 1 дня після процедури. Ця подія вимагала компресії під ультразвуковим контролем та ін'єкції тромбіну в псевдоаневризму і призвела до продовження госпіталізації пацієнта.

З 5 небажаних явищ, про які повідомлялося в частині 1 дослідження, було 1 можливо пов'язане з пристроєм: швидка кровотеча через 1 день після процедури, яка була класифікована як несерйозне явище. З 19 небажаних явищ, про які повідомлялося в частині 2 дослідження, спостерігалися 3 випадки гематоми, пов'язані з пристроєм і класифіковані як несерйозні явища, і 6 явищ, можливо пов'язаних із пристроєм, а саме 3 випадки постійного виділення крові, 2 гематоми та біль у 1 нозі після фізичних вправ; всі явища були класифіковані як несерйозні.

У 3 пацієнтів, які брали участь в частині 2 цього дослідження, процедура була визнана невдалою: у 2 випадках через нездатність досягти гемостазу без застосування компресії та в 1 випадку через серйозне судинне ускладнення (псевдоаневризму). У частині 1 дослідження невдалих процедур не було.

З шести випадків несправностей пристрою, зафіксованих в частині 2, три не заважали процедурі, один був пов'язаний з помилкою користувача, в одному випадку мало місце протікання інтродьюсера і в одному випадку — поломка ниткового з'єднання. Останні дві проблеми були усунуті після оновлення пристрою, реалізованого в моделі C11202.

Результати подальшого спостереження через 6 місяців після частини 2 домаркетингового клінічного дослідження не повідомлялися через недотримання пацієнтами вимог до участі в дослідженні. Результати домаркетингового клінічного дослідження (EU-SE-001) тривалістю 30 днів, що відповідає періоду подальшого спостереження згідно з даними в спеціалізованій медичній літературі, свідчать про те, що система FemoSeal™ VCS безпечна і ефективна.

#### 1.4.2 Огляд результатів післямаркетингових клінічних досліджень

Було проведено 4 післямаркетингові клінічні дослідження. Ці дослідження описані в таблиці 1.6 нижче. Результати цих клінічних досліджень не публікувалися і не викладалися в Інтернет.

**Таблиця 1.6 Завершені післямаркетингові клінічні дослідження**

| Завершені післямаркетингові клінічні дослідження                                            |                                                           |                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                        |

|--|--|--|--|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Дослідження 2006 року проводилося з метою підтвердження безпечності та ефективності поточної версії пристрою з покращеною системою доставки та отримання відгуків про інструкції із застосування FemoSeal™ VCS і навчальну програму для медичних працівників. Дослідження включало 100 пацієнтів; первинна кінцева точка: досягнення гемостазу або необхідність у додатковій ручній чи механічній компресії. Це дослідження продемонструвало, що застосування FemoSeal™ VCS було успішним у більшості випадків (91 % досягли негайного гемостазу).

У дослідження 2008 року було включено 50 пацієнтів для оцінки безпечності та ефективності FemoSeal™ VCS при використанні під час звичайної клінічної процедури у пацієнтів, які проходили катетеризацію серця із застосуванням інтродьюсера 7 Fr. Основною кінцевою точкою дослідження був збір даних про час до гемостазу та час до відновлення здатності пересуватися, без додаткової компресії, ручної чи механічної. Результати дослідження свідчили про те, що середній час до гемостазу становив 57,8 секунди, і всі пацієнти могли рухатися після 4 годин постільного режиму.

Дослідження 2009 року мало на меті оцінити нову упаковку FemoSeal™ VCS. У дослідження було включено 25 пацієнтів. Основною кінцевою точкою була наявність у користувача проблем з упаковкою. Користувачі не відзначили жодних проблем щодо нової упаковки FemoSeal™ VCS. В процесі цього дослідження також збиралися дані про час до гемостазу.

Дослідження 2022 року мало на меті проактивний збір даних щодо безпечності та ефективності FemoSeal VCS у досягненні гемостазу в місці доступу через загальну стегнову артерію у суб'єктів, яким виконують черезшкірні ендovasкулярні процедури. У дослідження було включено 230 пацієнтів. Первинними кінцевими точками реєстрового дослідження є успішне виконання процедури (тобто успішний гемостаз у місці пункції) та зменшення серйозних ускладнень (таких як пошкодження судин, кровотеча в місці доступу, інфікування місця доступу, повторна ручна компресія та нові випадки гострої ішемії іпсилатеральної нижньої кінцівки, пов'язані з місцем доступу). Дослідження продемонструвало, що при використанні в реальних умовах FemoSeal™ VCS відповідає заявленим характеристикам і забезпечує ефективний гемостаз з низьким рівнем ускладнень у місці доступу у пацієнтів, яким виконують ендovasкулярні втручання на периферичних судинах. Про ефективність пристрою свідчить короткий час досягнення гемостазу та хороші відгуки користувачів про зручність використання. На підставі цього FemoSeal™ VCS може вважатися цінним пристроєм для закриття судини після пункції стегнової артерії.

### 1.4.3 Огляд результатів післямаркетингового клінічного спостереження

#### 1.4.3.1 Завершені заходи в рамках післямаркетингового спостереження

Короткий огляд завершених заходів в рамках післямаркетингового клінічного спостереження наведений в таблиці 1.7 нижче.

**Таблиця 1.7. Заходи в рамках післямаркетингового спостереження**

|                                                                        |  |  |  |  | <div> <div>FemoSeal™ VCS були сприятливи ми.</div> <div> <div>○ Усі оцінки провідника, що постачаєтьс я разом з FemoSeal™ VCS, були сприятливи ми.</div> <div>○ Одне (0,8 %) небажане явище: диски FemoSeal™ VCS були неправильно вирівняні, ймовірно, через використанн я жорсткого провідника (Boston Scientific Amplatz Super Stiff, 75 см, 0,035 дюйма), що вимагало ручної компресії для досягнення гемостазу.</div> </div> </div> |

Компанія Terumo Medical Corporation провела три високоякісні опитування користувачів-лікарів протягом поточного звітного періоду (01 вересня 2019 р. – 31 серпня 2024 р.).

Опитування щодо клінічного застосування системи FemoSeal™ допомогли зібрати проактивні клінічні дані щодо безпечності та ефективності FemoSeal™ VCS під час застосування в клінічній практиці. Опитування включало запитання, що стосувалися як самого пристрою, так і приналежностей, призначених для використання з пристроєм,

включно з провідником 0,038 дюйма, та їхньої прямої взаємодії. Опитування щодо клінічного застосування провідника дозволило отримати проактивні клінічні дані щодо безпечності та ефективності клінічного використання 0,038-дюймового провідника, що постачається з разом з FemoSeal™ VCS. Запитання цього опитування були зосереджені саме на загальних аспектах використання провідника, починаючи з введення через інтродьюсер в судинну систему і закінчуючи видаленням дроту.

FemoSeal™ VCS і 0,038-дюймовий провідник, що входить до складу пристрою, отримали прийнятні оцінки; після розгляду коментарів, зібраних завдяки високоякісним клінічним опитуванням, було подано шість (6) скарг щодо пристрою і дев'ять (9) повідомлень щодо провідника. Скарги розглядалися в контексті застосування пристрою FemoSeal і провідника і оцінювалися в рамках післямаркетингового нагляду компанії Terumo. Нових ризиків та/або рівнів ризику виявлено не було.

Одне опитування користувачів-лікарів було проведене у 2024 році в рамках заходів з післямаркетингового клінічного спостереження. Результати опитування показали, що оцінка ефективності та безпечності FemoSeal™ VCS загалом є дуже сприятливою. Також було продемонстровано сумісність інших провідників, окрім стандартних, що постачаються з FemoSeal™ VCS.

#### **1.4.3.2 Поточні/заплановані післямаркетингові клінічні спостереження**

Компанія ТМС має один поточний/запланований захід в рамках післямаркетингового клінічного спостереження. Буде проведене клінічне опитування для проспективного збору відгуків про використання представлених на ринку ЄС провідників з FemoSeal VCS. Опитування буде проводитися серед лікарів і матиме на меті з'ясувати, які провідники вони використовували під час процедури. Мета цього опитування — усунути недостатність даних, що виникла в результаті недостатньої кількості літератури та коментарів зовнішніх рецензентів щодо сумісності FemoSeal™ VCS з провідниками інших брендів, що не належать компанії Terumo. Відгуки включають дані про технічні аспекти, клінічну ефективність і безпечність при використанні пристрою з різними провідниками.

#### **1.4.4 Дані, отримані в результаті систематичного огляду літератури**

Компанія Terumo Medical Corporation проводить систематичні огляди літератури, щоб зібрати та оцінити дані про клінічну безпечність та ефективність на підставі опублікованих відомостей про результати досліджень пристрою FemoSeal™ VCS та/або подібних пристроїв. Метою щорічної перевірки опублікованої літератури є виявлення раніше невідомих побічних ефектів, моніторинг відомих побічних ефектів, виявлення нових ризиків і випадків можливого систематичного неправильного використання або використання не за призначенням пристрою FemoSeal™ VCS.

В ході останнього систематичного огляду літератури, який охоплював період з 1 вересня 2019 року по 31 серпня 2024 року, виявлено 29 опублікованих досліджень, що містили дані про клінічну безпечність та ефективність пристрою FemoSeal™ VCS. Двадцять три джерела згадували про використання FemoSeal™ VCS згідно з інструкцією та з відхиленнями від інструкції в рамках дев'яти досліджень. Згідно з джерелами інформації про дослідження, пов'язані з використанням FemoSeal™ VCS, досліджувана популяція складається з пацієнтів з ЕС, які проходять процедуру черезшкірної катетеризації судин. Перелік цих 23 рецензованих публікацій про застосування пристрою згідно з ухваленими показаннями див. в **розділі 3**.

Клінічну ефективність оцінювали за такими параметрами:

- Час до гемостазу коротший або аналогічний тому, що спостерігається при застосуванні подібних пристроїв для стандартної процедури черезшкірного закриття стегнової артерії.
- Час до відновлення здатності пересуватися коротший або аналогічний тому, що спостерігається при застосуванні подібних пристроїв для стандартної процедури черезшкірного закриття стегнової артерії.
- Частота післяопераційних ускладнень нижча або аналогічна тій, що спостерігається при застосуванні подібних пристроїв.

Виходячи з цих показників клінічної ефективності, дані з оглянутої літератури вказують на те, що FemoSeal™ VCS можна успішно використовувати для закриття пункції стегнової артерії (артеріотомії) у пацієнтів, які пройшли черезшкірну катетеризацію з використанням інтродьюсера 7 Fr або менше. Повний гемостаз був досягнутий у більшості пацієнтів (79,65–100 %), причому середній час до гемостазу становив 0,5 хвилин, а середній час до виписки — 3 дні. Від 69,2 до 86,7 % пацієнтів змогли пересуватися через 5 годин після закриття місця пункції судини, а середній час перебування в ліжку після процедури становив 349 хвилин. Неефективність FemoSeal™ VCS спостерігалася у 3,68–4 % випадків, а додаткова ручна компресія вимагалася під час виконання 0,9–4,4 % процедур.

Клінічну безпечність оцінювали на підставі частоти небажаних явищ, включаючи, серед іншого, наступні:

- Кровотеча
- Гематома
- Псевдоаневризма
- Синець
- Артеріовенозна фістула

- Інфекція
- Смерть

Частота виникнення кожного з цих небажаних явищ при застосуванні FemoSeal™ VCS в ході перерахованих досліджень була меншою або порівнянною з показниками частоти виникнення при застосуванні ручної компресії або інших пристроїв для закриття місця пункції судини.

За результатами перегляду 10 звітів про клінічні випадки небажаних явищ виявлено не було, оскільки не було виявлено нових, непередбачуваних або неприйнятних ризиків.

Загальна ефективність використання FemoSeal™ VCS під час діагностичної ангіографії або інтервенційних операцій залежить від багатьох факторів, таких як стать, вік, анатомічні особливості пацієнта, супутні захворювання, анатомічне розташування місця пункції, досвід хірурга, метод розгортання VCD, післяопераційний догляд тощо. Окрім технічного успіху, включно з досягненням гемостазу, FemoSeal™ VCS мала такі клінічні переваги в плані закриття судин після пункції стегнової артерії як скорочення часу до гемостазу та часу до відновлення здатності пересуватися. Результати застосування FemoSeal™ VCS відповідають очікуваням для цього типу пристроїв за умови використання за призначенням. У деяких джерелах, знайдених протягом поточного періоду пошуку, містилися дані про використання досліджуваного пристрою в анатомічному місці, відмінному від загальної стегнової артерії, та для закриття артеріотомій > 7 Fr, що вважається використанням не за призначенням.

Однак, якщо FemoSeal™ VCS використовується з обережністю кваліфікованими лікарями, вона функціонує як корисний та необхідний клінічний пристрій. Під час вивчення цих джерел не було виявлено жодних даних про невідомі побічні ефекти, нові ризики або можливе систематичне неправильне використання пристрою. Загалом, таргетна терапія, а отже, і система FemoSeal™ VCS, задовольняють клінічну потребу, яка існує на даний момент у лікуванні ускладнень, пов'язаних із судинним доступом.

Загалом, після вивчення даних, зазначених в цих джерелах інформації, не було виявлено жодних невідомих раніше проблем з ефективністю чи безпечністю застосування пристрою в клінічних умовах і жодних небажаних явищ, які виникали з вищою, ніж очікувалося/прийнятною частотою. Таким чином, з цього огляду літератури можна зробити висновок, що система FemoSeal™ VCS при використанні для забезпечення компресії з метою досягнення гемостазу при артеріотомії після черезшкірної катетеризації має очікувані функціональні характеристики і не пов'язана з серйозними подіями, які вказують на проблеми з безпечністю.

#### 1.4.5 Огляд результатів післямаркетингового нагляду

Виробник розробив проактивну систему післямаркетингових досліджень, а розгляд усіх скарг здійснюється щомісяця відповідно до внутрішніх виробничих процедур. Отримані скарги проаналізовані за період з 1 вересня 2019 року по 31 серпня 2024 року. Загалом виробнику було надіслано 28 звітів про результати контролю над виробами медичного призначення і 476 звітів про скарги користувачів. З 28 звітів про результати контролю над виробами медичного призначення 27 стосувалися небажаних явищ і один — несправності пристрою. Протягом звітного періоду сталося два смертельні випадки, але жодна з зареєстрованих смертей не була визнана пов'язаною з досліджуваним пристроєм. Серед 476 скарг, поданих виробнику, найпоширенішими причинами скарг були труднощі при розгортанні (146 випадків, частота виникнення 0,0142 %). Режим відмови під час витягнення пристрою є другою за частотою скаргою з частотою виникнення 0,0126 % (130 подій).

Система для закриття місця пункції судини FemoSeal™ була продана в кількості понад 1 030 136 штук по всьому світу та 827 843 штуки в Європейській економічній зоні. Обчислена частота скарг на основі глобальних продажів становить 0,046 %. Загалом, кількість скарг від користувачів дуже низька. Не було виявлено жодних нових ризиків, не вказаних в інструкціях із застосування та документації з інформацією щодо ризиків.

Показники частоти виникнення небажаних побічних ефектів наведені в **таблиці 1.2**. За результатами розгляду скарг не було виявлено нових непередбачуваних, нових або неприйнятних ризиків. Значного підвищення частоти або збільшення тяжкості відомих небажаних побічних ефектів не спостерігалось.

#### 1.4.6 Загальний огляд безпеки та клінічних характеристик

Система FemoSeal™ VCS використовується для закриття місця проколу загальної стегнової артерії (артеріотомії) у пацієнтів, які пройшли черезшкірну катетеризацію з використанням інтродьюсера 7F (2,33 мм) або меншого розміру. Ця клінічна оцінка базується на всебічному аналізі наявних клінічних даних за період домаркетингового і післямаркетингового застосування, а також літератури стосовно призначеного використання FemoSeal™ VCS.

Був проведений комплексний огляд опублікованої літератури за період з 1 вересня 2019 року по 31 серпня 2024 року. Доказова база включала в себе 29 досліджень з використанням пристрою FemoSeal™ VCS. На підставі отриманих свідчень було зроблено висновок про те, що при використанні за призначенням досліджуваний пристрій є безпечним та ефективним, а будь-які ризики або небажані побічні ефекти, які можуть бути пов'язані з пристроєм за нормальних умов використання, є прийнятними, якщо враховувати користь для пацієнта. Результати застосування досліджуваних пристроїв

відповідають очікуванім для цього типу пристроїв за умови використання за призначенням.

Потенційні небажані побічні ефекти, пов'язані з використанням FemoSeal™ VCS, включають небажані явища, що зазвичай спостерігаються при застосуванні альтернативних способів закриття артеріотомії, наприклад, кровотечу та гематому. Загалом частота небажаних явищ, про які повідомлялося при використанні FemoSeal™ VCS, подібна до частоти небажаних явищ, що спостерігаються при застосуванні ручної компресії та аналогічних пристроїв для закриття місця пункції судин. Зокрема, для кровотечі та гематоми показники частоти виникнення при застосуванні FemoSeal™ VCS є нижчими, ніж при застосуванні аналогічних пристроїв для закриття місця пункції судин. Кожне з повідомлених небажаних явищ, як в опублікованій літературі, так і в результатах післямаркетингового нагляду, було ідентифіковане раніше (див. **розділ 1.3**).

Наявні дані щодо клінічної безпечності та ефективності FemoSeal™ VCS дозволяють припустити, що переваги пацієнта від використання цього пристрою для закриття місця пункції судини переважають можливі ризики, якщо його використовувати відповідно до інструкції із застосування.

Як зазначено в попередніх розділах вище, дані щодо застосування пристрою FemoSeal™ VCS демонструють узгодженість між даними стосовно оцінюваного пристрою (наприклад, використання пристрою, показники безпечності та ефективності та клінічні переваги) і стосовно еквівалентних та подібних пристроїв.

Перехресний аналіз даних щодо безпечності не виявив жодних невідповідностей між наступними даними:

- Дані з публікацій, присвячених аналогічним пристроям
- Дані про оцінюваний виріб
- Дані, зазначені в документації з управління ризиками
- Дані, зазначені на маркуванні та/або в інструкціях із застосування (тобто, до уваги беруться тільки дані про залишкові ризики, призначені для користувачів пристрою).

Клінічна безпечність була продемонстрована низькою частотою ускладнень, про яку свідчили дані в опублікованій рецензованій клінічній літературі, результати клінічних досліджень, спонсорованих компанією, дані щодо післямаркетингового застосування та відсутність випадків вилучення з ужитку. Даних про незадовільні робочі характеристики в публікаціях, присвячених застосуванню FemoSeal™ VCS згідно з визначеним виробником цільовим призначенням, виявлено не було.

### 1.5 Можливі діагностичні або терапевтичні альтернативи

Ручна компресія традиційно застосовується для досягнення гемостазу в місці артеріотомії після катетеризації судин. Ручна компресія часто супроводжувалася обмеженням здатності пацієнта рухатися протягом тривалого часу (до 8 годин після процедури) та значним дискомфортом і тривалим перебуванням у лікарні. В результаті нещодавно проведеного систематичного огляду з'ясувалося, що середній час досягнення гемостазу в разі ручної компресії становив 20,8 хвилини.<sup>1</sup>

Альтернативою ручній компресії є зовнішні гемостатичні пристрої, принципом дії яких є механічна компресія місця артеріотомії. Ці пристрої не скорочують час до гемостазу або час до відновлення здатності пересуватися, але полегшують роботу медичних працівників, замінюючи ручну компресію механічною. Частота небажаних явищ при застосуванні механічної компресії аналогічна частоті небажаних явищ із застосуванням ручної компресії.

Пристрої для закриття місця пункції судин, такі як FemoSeal™ VCS, призначені для закриття артеріотомії. Використання таких пристроїв скорочує час до гемостазу і сприяє ранньому відновленню здатності пацієнта самостійно рухатися. Проведений нещодавно систематичний огляд даних, включаючи дані про 13 представлених на ринку пристроїв, свідчить про те, що середній час до досягнення гемостазу за допомогою пристрою для закриття місця пункції судини становить 5,4 хвилини. Середній час до гемостазу для окремих пристроїв для закриття місця пункції судин коливався від 1 хвилини (FemoSeal™ VCS) до 14 хвилин; для більшості пристроїв — від 4 до 10 хвилин.<sup>1</sup>

До поширених небажаних явищ, пов'язаних із закриттям місця артеріотомії із застосуванням ручної компресії, зовнішніх гемостатичних пристроїв або засобів для закриття місця пункції судини, належать гематома, кровотеча в місці доступу, псевдоаневризма, артеріовенозна фістула та інфекція. В результаті того ж систематичного огляду (34 рандомізованих контрольованих дослідження, 14 401 пацієнт) було виявлено, що частота небажаних явищ при застосуванні ручної компресії і використанні пристроїв для закриття місця пункції судин була аналогічною, за винятком того, що частота кровотеч при застосуванні пристроїв є трохи вищою.<sup>1</sup>

## 1.6 Профіль рекомендованого користувача та навчання

Призначеними користувачами системи для закриття місця пункції судини FemoSeal™ є лікарі, які отримали належну підготовку з виконання артеріального доступу через загальну стегнову артерію та закриття місця пункції в рамках ендovasкулярних процедур і пройшли спеціальний інструктаж із застосування пристрою FemoSeal™ від компанії Terumo Medical Corporation.

## 1.7 Відповідні гармонізовані та загальні стандарти
